Table of Contents	2
Program description	3
Core Qualification	5
Module M0523: Business & Management	5
Module M0525: Dusiness & Management Module M0524: Non-technical Courses for Master	6
Module M0619: Waste Treatment Technologies	8
Module M0830: Environmental Protection and Management	10
Module M1311: Sustainable Water Management and Microbiology of Water Systems	12
Module M1313: Fluid Mechanics, Hydraulics and Geo-information-systems in Water Management	14
Module M1312: Environmental Analysis and water technology practice	16
Module M1123: Selected Topics in Environmental Engineering	18
Module M0857: Geochemical Engineering	21
Module M0870: Management of Surface Water	23
Module M0871: Hydrological Systems	25
Module M0875: Nexus Engineering - Water, Soil, Food and Energy	27
Module M0914: Technical Microbiology	29
Module M0828: Urban Environmental Management	31
Specialization Waste and Energy	33
Module M0518: Waste and Energy	33
Module M0620: Special Aspects of Waste Resource Management	36
Module M1720: Emerging Trends in Environmental Engineering	38
Module M0902: Wastewater Treatment and Air Pollution Abatement	39
Module M1125: Bioresources and Biorefineries	42
Module M1127: Study Work Waste and Energy	45
Module M1724: Smart Monitoring	46
Specialization Biotechnology	48
Module M0896: Bioprocess and Biosystems Engineering	48
Module M1720: Emerging Trends in Environmental Engineering	52
Module M0973: Biocatalysis	53
Module M1125: Bioresources and Biorefineries	55
Module M1128: Study Work Biotechnology Module M1724: Smart Monitoring	58 59
Specialization Water	61
Module M1116: Groundwater Modeling Module M0874: Wastewater Systems	61 63
Module M1074. Wastewater Systems Module M1126: Study Work Water	66
Module M1720: Emerging Trends in Environmental Engineering	67
Module M1720: Emerging Trends in Environmental Engineering	68
Module M0802: Process Modeling in Water Technology	70
Module M0949: Rural Development and Resources Oriented Sanitation for different Climate Zones	73
Module M0581: Water Protection	75
Module M1717: Advanced Vadose Zone Hydrology	77
Module M1718: Multiphase Flow in Porous Media	79
Module M1721: Water and Environment: Theory and Application	81
Module M1724: Smart Monitoring	82
Thesis	84
Module M-002: Master Thesis	84

Program description

Content

Environmental engineering has never been more relevant than it is today. In the past 20 years, the field has moved from purely focusing on the technical and logistical side of waste disposal to encompass material recovery and circular economy. Innovative materials, integrated material and process flow analysis, as well as the involvement of energy sector issues, have brought environmental technology - once a niche sector perceived to be partly driven by ideology - into mainstream areas of the international economy. Germany is a global market leader in many areas of environmental engineering expertise. This status requires ongoing success at different levels: innovative and integrated technology, favourable legal and economic standards and, not least, high-quality German university education in environmental sciences.

With this in mind, the International Master Program in Environmental Engineering at the Hamburg University of Technology (TUHH) focuses on current developments in environmental technology, while also providing a solid grounding in the subject's scientific and economic foundations. Students can specialise in one of three areas: (i) Water, (ii) Waste & Energy or (iii) Biotechnology. Interdisciplinary considerations are essential to all subject areas. How can environmental pollution be reduced and valuable resources recovered at the same time? How does one measure the sustainability of a product or service? Which innovative technologies assure minimum energy use in production processes? Which environmental law constraints favour sustainable development? All these questions are relevant in the Environmental Engineering program.

Graduates of the Environmental Engineering program have a detailed understanding of key areas of environmental sciences. At the start of the Master's program, all students take compulsory courses in environmental management, waste and wastewater treatment, fluid dynamics and hydrology, and environmental analytics. In the second semester, students can choose from a number of potential core areas. These include courses in geochemical engineering, technical microbiology and water and wastewater technology. From the third semester, students develop a specialisation in one of the areas mentioned above (Water, Waste and Energy, or Biotechnology). In addition to course-specific modules, students also take non-technical classes in subjects such as business economics or foreign languages.

Career prospects

Graduates of the International Master Program in Environmental Engineering are sought after in a broad range of different fields and have excellent prospects in terms of career development. Graduates may work, for example, for environmental authorities, water and wastewater companies, energy and waste management companies, engineering firms or in the biotechnology industry. Owing to the breadth and diversity of the course, Environmental Engineering graduates are able to quickly familiarise themselves with new information, which is highly beneficial when working in interdisciplinary teams, as will often be the case. Worldwide, the environmental technology sector is growing strongly. Inadequate environmental Engineering graduates are a significantly negative impact on the economic development of a region or country. In light of the above, Environmental Engineering graduates are international in their outlook and employed around the world. In addition to preparing students for demanding careers in industry, the Master's in Environmental Engineering also equips students with the necessary academic skills for pursuing their possible further specialisation at PhD level.

Learning target

Environmental Engineering graduates should have certain core skills and knowledge. These are listed below in the following categories: knowledge, skills, social skills and independence.

Knowledge:

- 1. Graduates are able to describe the fundamentals of environmental management and outline environmental standards, environmental economic instruments, the content of ISO 14001 and environmental performance evaluation.
- They are able to explain the procedural fundamentals of important water and wastewater treatment techniques, biotechnological processes, biological waste treatment (aerobic and anaerobic) and relevant environmental chemicals and their analytical determination, particularly in water and wastewater analysis.
- 3. They can discuss hydrological and fluid mechanical models and the technical boundary conditions for sustainable water protection.
- 4. They are able to define the key principles of circular economy (water/waste) and outline the fundamentals of business economics.
- 5. Depending on the specialisation they choose, graduates can demonstrate their broader understanding in the areas of water, waste and energy or biotechnology.

Skills:

- 1. Graduates are able to complete practical laboratory work in the area of municipal water engineering taking into consideration the procedure selection for water and wastewater treatment processes.
- 2. They are able to conduct specialist scientific research and geographical data processing and apply hydrological models.
- 3. They are able to argue and write scientifically.
- 4. Graduates are able to produce incisive individual presentations and coordinated team presentations, as practised in classes involving problembased learning (PBL).
- 5. They are able to apply fundamental business economics methods.
- 6. Depending on their chosen specialisation, they have further skills in the areas of water, energy and waste, or biotechnology. For example, they are able to design membrane separation processes, conduct modelling in water technology, select technical and regional planning solutions for tasks in a biorefinery or analyse and evaluate integrated waste management solutions.

Social skills:

- 1. The degree program Environmental Engineering attracts students from all over the world. From the beginning of the course, students work in diverse teams, in which they are able to use their different skill sets and values productively when working on technical problems.
- 2. On completion of their studies, students are able to develop technical proposals, comprehensively review results and, where relevant, confirm them through peer discussion.
- 3. They can present technical solutions as a team.
- 4. They can also give constructive feedback to fellow students and integrate feedback on their own performance appropriately into their own work.

Autonomy:

- 1. Graduates of the Environmental Engineering program are able to conduct independent research using scientific literature; read test reports; gain knowledge from these reports and transfer it to the project at hand.
- 2. In consultation with teaching staff, they are able to evaluate their own learning in concrete terms and define subsequent steps for ongoing progress.
- 3. They can independently define research and development tasks for theoretical and experimental investigation of environmental issues and plan and carry out projects in this regard.

Program structure

The Master's program in Environmental Engineering is composed primarily of modules with six credit points (CPs). One CP equates to a student workload of 30 hours (classroom contact hours and study undertaken at home, including examination preparation). Master's students must complete 120 CPs in four semesters over a two-year period.

The modules are divided into: (i) **core qualification**, (ii) **specialisation** and (iii) **thesis**. For the **core qualification**, all students initially attend compulsory courses amounting to 42 CPs. These are primarily completed in the first and second semesters. Based on their individual interests, students take a further 18 CPs from a possible 30 CPs of elective courses. These modules are primarily completed in the second and third semesters. It is obligatory for students to take one business economics module and a module with non-technical courses (foreign language, art or cultural courses). **Specialisation** encompasses 12 CPs of obligatory courses (project work) and 18 CPs elective courses, to be selected from the study options in the specialisations Water, Waste and Energy, or Biotechnology. These modules are primarily completed in the third semester. In the fourth semester, students complete their **thesis** (30 CPs). This is preferably completed in the student's specialisation, though this is not obligatory. The third or fourth semester is most suited to students wishing to spend time abroad or on an industry placement as project and thesis work can be completed independent of lecture periods and in direct agreement with the supervising Professor.

Core Qualification

Module M0523: Busine	ess & Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Skills	 Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.
Personal Competence Social Competence	• Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	• Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter
dmission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives rofessional Competence	After taking part successfully, students have reached the following learning results
	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover a Self-reliance, self-management, collaboration and professional and personnel management competences. The departm implements these training objectives in its teaching architecture , in its teaching and learning arrangements , in teach areas and by means of teaching offerings in which students can qualify by opting for specific competences and a compete level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechn complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontech academic programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual developmen competences. It also provides orientation knowledge in the form of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in on two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making transition from school to university and in order to encourage individually planned semesters abroad, there is no obligatio study these subjects in one or two specific semesters during the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of de- with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are delibera encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studi communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the wi semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging or oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. Th differences are reflected in the practical examples used, in content topics that refer to different professional application conto and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leader functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
Skills	Professional Competence (Skills)
	In selected sub-areas students can
	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specidiscipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond

Module Manual M.Sc. "Environmental Engineering"

Courses

Personal Competence	
Social Competence	Personal Competences (Social Skills)
	 Students will be able to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
	Personal Competences (Self-reliance) Students are able in selected areas • to reflect on their own profession and professionalism in the context of real-life fields of application • to organize themselves and their own learning processes • to reflect and decide questions in front of a broad education background • to communicate a nontechnical item in a competent way in writen form or verbaly • to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Credit points	0

Course L0406: Sustainable Water Management		
Тур	Project-/problem-based Learning	
Hrs/wk	2	
СР	3	
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28	
Lecturer	Prof. Mathias Ernst	
Language	EN	
Cycle	WiSe	
Content	The course provides knowledge on the sustainable treatment and management of the resource water. Used water is an alternative resource and can be recycled in any field of the urban water cycle after adequate treatment. The resulting water quality is the decisive issue. In the course the central quality parameters of drinking- as well as wastewater assessment will be presented and discussed. Moreover the legal frame for water reuse in the EU and examples from all over the world will be communicated. The students receive the task to develop a conceptual design study of an indirect potable reuse facility in given boundary conditions. To fulfill this task, the students will work in small groups representing a consulting firm. Later in the course the firms will present their concepts. In preparation to the team presentation further knowledge on alternative water resources and sustainable management will be provided. International case studies will be presented and discussed. Next to the communication of technical details, planning tools for the implementation of alternative water management will be given also Option for an effective public perception program of later water users.

Courses				
Title		Тур	Hrs/wk	СР
Geo-Information-Systems in Water	Management and Hydraulic Engineering (L0963)	Project-/problem-based Learning	2	2
Fluid Mechanics and Hydraulics (L1		Lecture	2	2
Fluid Mechanics and Hydraulics (L1		Recitation Section (small)	1	2
Module Responsible	Prof. Peter Fröhle			
Admission Requirements	None			
Recommended Previous	Mathematics (calculus) and physics; Knowledge of stat	tics and thermodynmaik would be benefici	al.	
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	After finishing the module the students will lern the properties of fluid, hydrostatics, Fluid kinematics, conservation equation			
(mass, energy and momentum), flow in pipes, boundary layer theory , viscous flow (skin friction and drag force		orces), flow in pipe		
	hydraulics of open channel, flow in compound and natural channels, energy head losses.			
Skills	The students will be capable to calculate and analyse the forces in the fluids as well as flow in pipes and channels.			
Personal Competence				
Social Competence	The students learn to deploy their knowledge in applied problems such as calculation of water level and the rate of water rise			
	flood events. Furthermore, they will be able to work in team with engineers of other disciplines, for instance by designing of gate			
Autonomy	The students will be able to independently extend their	The students will be able to independently extend their knowledge and applyit to new problems.

	Goal of this course is it to discuss the physical, chemical, and biological as well as the technical, economic, and environment basics of all options to provide energy from biomass from a German and international point of view. Additionally different syste approaches to use biomass for energy, aspects to integrate bioenergy within the energy system, technical and econom development potentials, and the current and expected future use within the energy system are presented.
	 Biomass as an energy carrier within the energy system; use of biomass in Germany and world-wide, overview on the content of the course Photosynthesis, composition of organic matter, plant production, energy crops, residues, organic waste Biomass provision chains for woody and herbaceous biomass, harvesting and provision, transport, storage, drying Thermo-chemical conversion of solid biofuels Basics of thermo-chemical conversion Direct thermo-chemical conversion through combustion: combustion technologies for small and large scale unit electricity generation technologies, flue gas treatment technologies, ashes and their use Gasification: Gasification technologies for the provision of bio-oil and/or for the provision of charcoal, oil cleaning technologies, options to use the cleaned producer g for the provision of biomass containing oils and/or fats: Basics, oil seeds and oil fruits, vegetable oil production production of a biofuel with standardized characteristics (trans-esterification, hydrogenation, co-processing in existing refineries), options to use this fuel, options to use the residues (i.e. meal, glycerine)
	 Biogas: Process technologies for plants using agricultural feedstock, sewage sludge (sewage gas), organic was fraction (landfill gas), technologies for the provision of bio methane, use of the digested slurry Ethanol production: Process technologies for feedstock containing sugar, starch or celluloses, use of ethanol as a fuuse of the stillage

Content	The part Contaminated Sites gives an introduction into different scales of pollution and identifies key pollutants. Geochemical attenuation mechanisms and the role of organisms are highlighted affecting the fate of pollutants in leachate and groundwater. Techniques for site characterization and remediation are discussed including economical aspects. The part Landfilling is introduced by discussing fundamental aspects and the worldwide situation of waste management. The lecture highlights transformation processes in landfill bodies, emissions of gases and leachate, and the long-term behaviour of landfill sites with measures of aftercare.

	As an introduction cases are presented in which geochemical engineering was used to solve environmental problems. Environmentally important minerals are discussed and methods for their detection. It is demonstrated how solution equilibria can be modified to eliminate elevated concentrations of unwanted species in solution and how carbon dioxide concentration affects pH and the dissolution of carbonate minerals. Modifications of redox conditions, pH, and electrolyte concentration are shown to be effective tools for controlling the mobility and fate of hazardous species in the environment.

Specialization Waste and Energy

Graduates of the Waste & Energy specialization learn to use their knowledge in management for the planning of waste disposal processes and projects. Furthermore they have extended knowledge in special topics, such as bio-treatment of waste, energy conversion and international waste management. Graduates are able to evaluate the necessary technological key figures and to make decisions based on these. They are able to put their theoretical knowledge into practice and to analyze complex questions in waste management and technology. They learn diverse methods and techniques of waste and energy process technology and are able to use them successful for different tasks.

Content	 Focus of the course "Advanced topics of waste resource management" lies on the organisational structures in waste management - such as planning, financing and logistics. One excursion will be offered to take part in (incineration plant, vehicle fleet and waste collection systems). The course is split into two parts: part: "Conventional" lecture (development of waste management, legislation, collection, transportation and organisation of waste management, costs, fees and revenues). part: Project base learning: You will get a project to work out in groups of 4 to 6 students; all tools and data you need to work out the project were given before during the conventional lecture. Course documents are published in StudIP and communication during project work takes place via StudIP. The results of the project work are presented at the end of the semester. The final mark for the course consists of the grade for the presentation.

Course L0203: Air Pollution A	Abatement
Тур	Lecture
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Swantje Pietsch-Braune, Christian Eichler
Language	EN
Cycle	WiSe
Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.
Literature	Handbook of air pollution prevention and control, Nicholas P. Cheremisinoff Amsterdam [u.a.] : Butterworth-Heinemann, 2002 Atmospheric pollution : history, science, and regulation, Mark Zachary Jacobson Cambridge [u.a.] : Cambridge Univ. Press, 2002 Air pollution control technology handbook, Karl B. Schnelle Boca Raton [u.a.] : CRC Press, c 2002 Air pollution, Jeremy Colls 2. ed London [u.a.] : Spon, 2002

Content	 The Europe 2020 strategy calls for bioeconomy as the key for smart and green growth of today. Biorefineries are the fundamental part on the way to convert the use of fossil-based society to bio-based society. For this reason, agriculture and forestry sectors are increasingly deliver bioresources. It is not only for their traditional applications in the food and feed sectors such as pulp or pape and construction material productions, but also to produce bioenergy and bio-based products such as bio-plastics. However although bioresources are renewable, they are considered as limited resources as well. The bioeconomy's limitation factor is the availability land on our world. In the context of the development of the bioeconomy, the sustainable and reliable supply of noon food biomass feedstock is a critical success factor for the long-term perspective of bioenergy and other bio-based products. The electure gives an overview on biorefinery technology and shall contribute to promotion of international biorefinery developments. Lectures: What is a biorefinery: Overview on basic organic substrates and processes which lead to material and energy products The way from a fossil based to a biobased economy in the 21st century The worlds most advanced biorefinery systems and their products (e.g. lignocellulose biorefinery, green biorefinery, whole plant biorefinery, civilization biorefinery) Example projects (e.g. combination of anaerobic digestion and composting in practice; demonstration project in Hamburgy city quarter Jenfelder Au) The lectures will be accompanied by technical tours. Optional it is also possible to visit more biorefinery lectures in the University of Hamburg (lectures in German only).
	In the exercise students have the possibility to work in groups on a biorefinery project or to work on a student-specific task.

-	In the context of limited fossil resources, climate change mitigation and increasing population growth, Bioresources has a spe role. They have to feed the population and in the same time they are important for material production such as pulp and pape construction materials. Moreover they become more and more important in chemical industry and in energy provision as fo substitution. Although Bioresources are renewable, they are also considered as limited resources. The availability of land on planet is the main limitation factor. The sustainable and reliable supply of non-food biomass feedstock is a critical for succes and long term perspective on production of bioenergy and other bio-based products. As the consequence, the increase competition and shortages continue to happen at the traditional sectors. On the other side, huge unused but potentials residue waste and wastewater sector exist. Nowadays, a lot of activities to develop better processes, to create new bio-based product order to become more efficient, the inclusion of secondary and tertiary bio-resources in the valorisation chain are going on. The lecture deals with the current state-of-the-art of bioresource management. It shows deficits and potentials for improvem especially in the sector of utilization of organic residues for material and energy generation: <i>Lectures on:</i> Bioresource generation and utilization including lost potentials today Basic biological, mechanical, physico-chemical and logistical processes The conflict of material vs. energy generation from wood / waste wood The basics of pulp & paper production including waste paper recycling The Pros and Cons from biogas and compost production <i>Special lectures by invited guests from research and practice:</i> Pathways of waste organics on the example of Hamburg's City Cleaning Company Utilization options of landscaping materials on the example of grass Increase of process efficiency of anaerobic digestions Decision support tools on the example of an municipality in Indonesia
	Optional: Technical visits

Тур	Integrated Lecture
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Kay Smarsly
Language	EN
Cycle	WiSe/SoSe
Content	In this course, principles of smart monitoring will be taught, focusing on modern concepts of data acquisition, data storage, and data analysis. Also, fundamentals of intelligent sensors and embedded computing will be illuminated. Autonomous software and decentralized data processing are further crucial parts of the course, including concepts of the Internet of Things, Industry 4.0 and cyber-physical systems. Furthermore, measuring principles, data acquisition systems, data management and data analysis algorithms will be discussed. Besides the theoretical background, numerous practical examples will be shown to demonstrate how smart monitoring may advantageously be used for assessing the condition of systems in the built or natural environment.

Workload in Hours	Independent Study Time 92, Study Time in Lecture 28
Lecturer	Prof. Kay Smarsly
Language	EN
Cycle	WiSe/SoSe
Content	The contents of the exercises are based on the lecture contents. In addition to the exercises, project work will be conducted, which will consume the majority of the workload. As part of the project work, students will design smart monitoring systems that will be tested in the laboratory or in the field. As mentioned in the module description, the students will participate in the "Smart Monitoring" competition, hosted annually by the Institute of Digital and Autonomous Construction. Students are encouraged to contribute their own ideas. The tools required to implement the smart monitoring systems will be taught in the group exercises as well as through external sources, such as video tutorials and literature.

Specialization Biotechnology

Graduates of the Biotechnology specialization learn to use their knowledge in management for the planning of biotechnological processes and projects. Furthermore they have extended knowledge in special topics, such as bio resources, bio catalysis and bio-system-technology. Graduates are able to evaluate the necessary technological key figures and to make decisions based on these. They are able to put their theoretical knowledge into practice and to analyze complex questions in biotechnological management. They learn diverse methods and techniques of bio-process technology and are able to use them successful for different tasks.

Content	The Europe 2020 strategy calls for bioeconomy as the key for smart and green growth of today. Biorefineries are the fundaments part on the way to convert the use of fossil-based society to bio-based society. For this reason, agriculture and forestry sectors are increasingly deliver bioresources. It is not only for their traditional applications in the food and feed sectors such as pulp or pap and construction material productions, but also to produce bioenergy and bio-based products such as bio-plastics. However, although bioresources are renewable, they are considered as limited resources as well. The bioeconomy's limitation factor is the availability land on our world. In the context of the development of the bioeconomy, the sustainable and reliable supply of noo food biomass feedstock is a critical success factor for the long-term perspective of bioenergy and other bio-based produce production. Biorefineries are complex of technologies and process cascades using the available primary, secondary and tertia bioresources to produce a multitude of products - a product mix from material and energy products. The lecture gives an overview on biorefinery technology and shall contribute to promotion of international biorefineries developments.
	 Lectures: What is a biorefinery: Overview on basic organic substrates and processes which lead to material and energy products The way from a fossil based to a biobased economy in the 21st century The worlds most advanced biorefinery Presentation of various biorefinery systems and their products (e.g. lignocellulose biorefinery, green biorefinery, whole pla biorefinery, civilization biorefinery) Example projects (e.g. combination of anaerobic digestion and composting in practice; demonstration project in Hamburg city quarter Jenfelder Au)
	The lectures will be accompanied by technical tours. Optional it is also possible to visit more biorefinery lectures in the Universit of Hamburg (lectures in German only). In the exercise students have the possibility to work in groups on a biorefinery project or to work on a student-specific task.

Content	In the context of limited fossil resources, climate change mitigation and increasing population growth, Bioresources has a speci- role. They have to feed the population and in the same time they are important for material production such as pulp and paper of construction materials. Moreover they become more and more important in chemical industry and in energy provision as foss substitution. Although Bioresources are renewable, they are also considered as limited resources. The availability of land on or planet is the main limitation factor. The sustainable and reliable supply of non-food biomass feedstock is a critical for successf and long term perspective on production of bioenergy and other bio-based products. As the consequence, the increasin competition and shortages continue to happen at the traditional sectors. On the other side, huge unused but potentials residue of waste and wastewater sector exist. Nowadays, a lot of activities to develop better processes, to create new bio-based products lo order to become more efficient, the inclusion of secondary and tertiary bio-resources in the valorisation chain are going on. The lecture deals with the current state-of-the-art of bioresource management. It shows deficits and potentials for improvement especially in the sector of utilization including lost potentials today • Bioresource generation and utilization including lost potentials today • Bioresource generation and utilization including waste paper recycling • The conflict of material vs. energy generation from wood / waste wood • The basics of pulp & paper production including waste paper recycling • The Pros and Cons from biogas and compost production <i>Special lectures by invited guests from research and practice:</i> • Pathways of waste organics on the example of Hamburg's City Cleaning Company • Utilization options of landscaping materials on the example of grass • Increase of process efficiency of anaerobic digestions • Decision support tools on the example of an municipality in Indonesia <i>Optional: Te</i>

Cycle	WiSe/SoSe
Content	In this course, principles of smart monitoring will be taught, focusing on modern concepts of data acquisition, data storage, and data analysis. Also, fundamentals of intelligent sensors and embedded computing will be illuminated. Autonomous software and decentralized data processing are further crucial parts of the course, including concepts of the Internet of Things, Industry 4.0 and cyber-physical systems. Furthermore, measuring principles, data acquisition systems, data management and data analysis algorithms will be discussed. Besides the theoretical background, numerous practical examples will be shown to demonstrate how smart monitoring may advantageously be used for assessing the condition of systems in the built or natural environment.

Content	The contents of the exercises are based on the lecture contents. In addition to the exercises, project work will be conducted, which will consume the majority of the workload. As part of the project work, students will design smart monitoring systems that will be tested in the laboratory or in the field. As mentioned in the module description, the students will participate in the "Smart Monitoring" competition, hosted annually by the Institute of Digital and Autonomous Construction. Students are encouraged to contribute their own ideas. The tools required to implement the smart monitoring systems will be taught in the group exercises as well as through external sources, such as video tutorials and literature.

Specialization Water

Graduates of the Water specialization learn to use their knowledge in management for the planning of water technology processes and projects. Furthermore they have extended knowledge in special topics, such as aquatic chemistry, groundwater engineering, modelling or membrane technology. Graduates are able to evaluate the necessary technological key figures and to make decisions based on these. They are able to put their theoretical knowledge into practice and to analyze complex questions in water management. They learn diverse methods in techniques of water engineering and are able to use them successful for different tasks.

Educational Objectives	After taking part successfully, students have reached the following	learning results		
	Students are able to define typical aquifer types and the occuring flow and storage processes can be explained technically. The are able to derive the Darcy law and the mathematical description of flow processes as well as their solution. They are in a positic to explain the physical background of well hydraulics. Fundamentals of solute transport can be reflected. They are able to use th flow and tranport model MODFLOW/MT3D The students are able to build a concept model for ground water flow and to transfer this in a numerical flow model. They can us the model MODFLOW expertly and they are able to apply it for practicaL problems.

Lecturer	Prof. Mathias Ernst
Language	EN
Cycle	WiSe
	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis. The functions, advantages and drawbacks of different membrane housings and modules are explained. Students learn how an industrial membrane application is designed in the succession of treatment steps like pre-treatment, water conditioning, membrane integration and post-treatment of water. Besides theory, the students will be provided with knowledge on membrane demo-site examples and insights in industrial practice.

Course L2762: Smart Monito	ring
Тур	Integrated Lecture
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Kay Smarsly
Language	EN
Cycle	WiSe/SoSe
Content	In this course, principles of smart monitoring will be taught, focusing on modern concepts of data acquisition, data storage, and data analysis. Also, fundamentals of intelligent sensors and embedded computing will be illuminated. Autonomous software and decentralized data processing are further crucial parts of the course, including concepts of the Internet of Things, Industry 4.0 and cyber-physical systems. Furthermore, measuring principles, data acquisition systems, data management and data analysis algorithms will be discussed. Besides the theoretical background, numerous practical examples will be shown to demonstrate how smart monitoring may advantageously be used for assessing the condition of systems in the built or natural environment.

Course L2763: Smart Monito	ring
Тур	Recitation Section (small)
Hrs/wk	2
СР	4
Workload in Hours	Independent Study Time 92, Study Time in Lecture 28
Lecturer	Prof. Kay Smarsly
Language	EN
Cycle	WiSe/SoSe
Content	The contents of the exercises are based on the lecture contents. In addition to the exercises, project work will be conducted, which will consume the majority of the workload. As part of the project work, students will design smart monitoring systems that will be tested in the laboratory or in the field. As mentioned in the module description, the students will participate in the "Smart Monitoring" competition, hosted annually by the Institute of Digital and Autonomous Construction. Students are encouraged to contribute their own ideas. The tools required to implement the smart monitoring systems will be taught in the group exercises as well as through external sources, such as video tutorials and literature.

Module M-002: Maste	r Thesis
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	According to General Regulations §21 (1):
	At least 60 credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	• The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized
	issues.
	• The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject,
	describing current developments and taking up a critical position on them.The students can place a research task in their subject area in its context and describe and critically assess the state of
	research.
Skills	The students are able:
	• To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question.
	• To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or
	incompletely defined problems in a solution-oriented way.
	 To develop new scientific findings in their subject area and subject them to a critical assessment.
Personal Competence	
Social Competence	Students can
	• Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured
	way.
	 Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while whether the issues are advised and a size a size a size
	while upholding their own assessments and viewpoints convincingly.
Autonomy	Students are able:
	 To structure a project of their own in work packages and to work them off accordingly.
	 To work their way in depth into a largely unknown subject and to access the information required for them to do so.
	• To apply the techniques of scientific work comprehensively in research of their own.
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
