Master

Water and Environmental Engineering

Cohort: Winter Term 2017

Updated: 28th September 2018

Program description

Content

Master of Science in 'Water and Environmental Engineering'

The Master of Science in Water and Environmental Engineering gives students a choice of three areas of specialization - Water, Environment and City. Graduates of the Master in Water and Environmental Engineering are able to translate the engineering, mathematical and scientific knowledge gained on the course into practice in order to analyze problems scientifically and solve them even when they are unusually or incompletely defined and have complex specifications. Graduates have the ability to work independently, to apply the methods and processes required to solve technical and planning problems, and to apply, critically scrutinize, and further develop new findings. They are also qualified to plan exacting (household) water management projects and projects geared to environmental protection and to plan them paying due attention to the necessary clarifications and examination of existing information and resources. They can

- Collaborate successfully with professional and non-professional players in public administration, industry, and academia
- Independently define research tasks for theoretical and experimental exploration of environmental and water management issues and plan and execute projects in those areas
- Responsibly assess and take into account the concerns of those affected by planning and implementation and of society in general
- work together in international teams on international subjects with cross-cultural competence.

Core qualification

Module M0523: Business & Management				
Module Responsible				
Admission Requirements	None			
Recommended Previous Knowledge	None			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge. 			
Skills	 Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management. 			
Personal Competence				
Social Competence	 Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems 			
Autonomy	 Students are capable of acquiring necessary knowledge independently by means of research and preparation of material. 			
Workload in Hours	Depends on choice of courses			
Credit points	6			

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter			
Admission Requirements	None			
Recommended Previous Knowledge	Nono			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
	The Nontechnical Academic Programms (NTA)			
	imparts skills that, in view of the TUHH's training profile, professional engineering studie require but are not able to cover fully. Self-reliance, self-management, collaboration ar professional and personnel management competences. The department implements thes training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting fis specific competences and a competence level at the Bachelor's or Master's level. Th teaching offerings are pooled in two different catalogues for nontechnical complementa courses.			
	The Learning Architecture			
	consists of a cross-disciplinarily study offering. The centrally designed teaching offerir ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses.			
	The learning architecture demands and trains independent educational planning as regard the individual development of competences. It also provides orientation knowledge in the for of "profiles".			
	The subjects that can be studied in parallel throughout the student's entire study program - need be, it can be studied in one to two semesters. In view of the adaptation problems th individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is r obligation to study these subjects in one or two specific semesters during the course studies.			
	Teaching and Learning Arrangements			
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other acros semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learnir in courses are part of the learning architecture and are deliberately encouraged in specif courses.			
	Fields of Teaching			
Knowledge	are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, communication studies, migration studies and sustainability researc and from engineering didactics. In addition, from the winter semester 2014/15 students on a Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way.			
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Her the focus is on encouraging goal-oriented communication skills, e.g. the skills required b outgoing engineers in international and intercultural situations.			
	The Competence Level			

[7]

	Hamburs University of Tarbonion				
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc. This is also reflected in the different quality of soft skills, which relate to the different team				
	positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.				
	Specialized Competence (Knowledge)				
	Students can				
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject. 				
	Professional Competence (Skills)				
	In selected sub-areas students can				
Skills	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject. 				
Personal Competence	Personal Competences (Social Skills)				
	Students will be able				
Social Competence	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen). 				
	Personal Competences (Self-reliance) Students are able in selected areas				
	• to reflect on their own profession and professionalism in the context of real-life fields of				
	[8]				

Autonomy	 application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module M0826: Biology, Geology and Chemistry

Courses				
Title		Тур	Hrs/wk	СР
Biology (L1428)		Lecture	2	2
Geology and Soil Science	(L0903)	Lecture	2	2
Environmental Analysis (L	0354)	Lecture	2	2
Module Responsible	Dr. Dorothea Rechtenbach			
Admission Requirements	None			
Recommended Previous Knowledge	Fundamentals of inorganic/organic chemistry and biology (knowledge acquired at school)			
Educational Objectives	After taking part successfully, studen	ts have reached the follow	ing learning resu	lts
Professional				
Competence				
Knowledge	With the completion of this module students acquire profound knowledge of the geo- and pedosphere, biogeochemical processes and the fate of migrating compounds in soil and groundwater. They learn about methods to investigate sites for different use.			
Skills	With the completion of this module students can apply the acquired theoretical knowledge to model sites and assess the situation technically and conceptually. They are able to draw comparisons on different investigation strategies and techniques. Model projects can be devised and treated.			
Personal Competence				
Social Competence	Students can discuss technical and scientific tasks within a seminar subject specific and interdisciplinary.			
Autonomy	Students can independently exploit sources , acquire the particular knowledge of the subject and apply it to new problems.			
Workload in Hours	Independent Study Time 96, Study T	ime in Lecture 84		
Credit points	6			
Examination	Written exam			
Examination duration and scale	2 Std. 15 Min.			
Assignment for the Following Curricula	Water and Environmental Engineerir	ng: Core qualification: Con	npulsory	

Course L1428: Biology	Course L1428: Biology

Module M0962: S	ustainability and Risk Manag	ement		
Courses				
Title Safety, Reliability and Risk Environment and Sustaina		Typ Seminar Lecture	Hrs/wk 2 2	CP 3 3
Module Responsible				
Admission Requirements	None			
Recommended Previous Knowledge	none			
Educational Objectives	After taking part successfully, students h	ave reached the follow	ing learning resul	ts
Professional Competence				
Knowledge	 Students are able to describe single techniques and to give an overview for the field of safety and risk assessment as well as environmental and sustainable engineering, in detail: basics in safety and reliability of technical facilities safety and reliability analysis methods risk assessment Production and usage of bio-char energy production and supply sustainable product design 			
	Students are able apply interdisciplina sustainability reporting. They can eva economically feasible treatment concept	luate the effort and c	thods for risk as osts for processe	sessment and es and seled
Personal Competence				
Social Competence				
Autonomy	Students can gain knowledge of the subject area from given sources and transform it to new questions. Furthermore, they can define targets for new application or research-oriented duties in for risk management and sustainability concepts accordance with the potential social, economic and cultural impact.			
Workload in Hours	Independent Study Time 124, Study Tim	e in Lecture 56		
Credit points	6			
	Written elaboration			
Examination duration and scale	Leaporation and presentation (45 minutes in droups)			
-				

Course L1145: Safety,	Reliability and Risk Assessment
Тур	Seminar
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Marco Ritzkowski
Language	DE
Cycle	WiSe
Content	 An introduction in safety and risk assessment is given and some typical problems of structural and environmental engineering are treated: basics in safety and reliability of technical facilities safety and reliability analysis methods risk assessment practical examples and excursions discussions and presentations

Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.

Admission Requirements	None			
Recommended Previous Knowledge	Knowledge on measures for climate protection and climate change adaptation			
Educational Objectives	After taking part successfully, students have	e reached the following lea	arning resu	lts
Professional Competence				
Knowledge	Students can describe urban development corridors as well as current and future urban environmental problems. They are able to explain the causes of environmental problems (like noise). Students can specify applications for various technical innovations and explain why these contribute to the improvement of urban life. They can, for example, derive and discuss measures for effective noise abatement.			
Skills	Students are able to develop specific solutions for correcting existing or future environment related problems of urban development. They can define a range of conceptual and technica solutions for environmental problems for different development paths. To solve specific urbar environmental problems they can select technical innovations and integrate them into the urban context.			
Personal Competence				
Social Competence	The students can work together in interneti	onal groups.		
Autonomy	Students are able to organize their work flow to prepare themselves for presentations and contributions to the discussions. They can acquire appropriate knowledge by making enquiries independently.

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Dr. Joachim Gerth, Dr. Marco Ritzkowski
Language	EN
Cycle	SoSe
Content	The part Contaminated Sites gives an introduction into different scales of pollution and identifies key pollutants. Geochemical attenuation mechanisms and the role of organisms are highlighted affecting the fate of pollutants in leachate and groundwater. Techniques for site characterization and remediation are discussed including economical aspects. The part Landfilling is introduced by discussing fundamental aspects and the worldwide situation of waste management. The lecture highlights transformation processes in landfill bodies, emissions of gases and leachate, and the long-term behaviour of landfill sites with measures of aftercare.
Literature	 Waste Management. Content	As an introduction cases are presented in which geochemical engineering was used to solve environmental problems. Environmentally important minerals are discussed and methods for their detection. It is demonstrated how solution equilibria can be modified to eliminate elevated concentrations of unwanted species in solution and how carbon dioxide concentration affects pH and the dissolution of carbonate minerals. Modifications of redox conditions, pH, and electrolyte concentration are shown to be effective tools for controlling the mobility and fate of hazardous species in the environment.

Admission Requirements	None			
	Fundamentals of Hydromechanics, Hydrau Hydraulic Engineering I and Hydraulic Engine		Hydraulic	Engineering
Educational Objectives	After taking part successfully, students have re	eached the following lea	arning resul	lts
Professional Competence				
Knowledge	Students are able to define in detail the basic processes that are related to the modelling o flows in hydraulic engineering. Besides, they can describe the basic aspects of numerica modelling and actual numerical models for the simulation of flows and waves. They can also depict the concepts of nature oriented hydraulic engineering.			
Skills	Students are able to apply hydrodynamic-numerical models to practical hydraulic engineering tasks. Furthermore, the students are able to set up flood-risk management concepts and are able to apply basic concepts of renaturation to practical problems.			
Personal Competence				
Social Competence	The students are able to deploy their gained knowledge in applied problems of the practical nature-based hydraulic engineering. Additionaly, they will be able to work in team with engineers of other disciplines.			
Autonomy	The students will be able to independently extend their knowledge and apply it to new problems.			
Workload in Hours	Independent Study Time 110, Study Time in L	ecture 70

Educational Objectives	After taking part successfully, students	have reached the following lea	arning resu	lts
Professional Competence				
	The module aims possess knowledge concerning the planning of biological waste treatmen plants. Students are able to explain the design and layout of anaerobic and aerobic waste treatment plants in detail, describe different techniques for waste gas treatment plants fo biological waste treatment plants and explain different methods for waste analytics.			
Skills	The students are able to discuss the compilation of design and layout of plants. They can critically evaluate techniques and quality control measurements. The students can rechercher and evaluate literature and date connected to the tasks given in der module and plan additional tests. They are capable of reflecting and evaluating findings in the group.			
Personal Competence				
Social Competence	Students can participate in subject-specific and interdisciplinary discussions, develor cooperated solutions and defend their own work results in front of others and promote the scientific development in front of colleagues. Furthermore, they can give and accer professional constructive criticism.			
Autonomy	Students can independently tap knowledge from literature, business or test reports and transform it to the course projects. They are capable, in consultation with supervisors as we as in the interim presentation, to assess their learning level and define further steps on thi basis. Furthermore, they can define targets for new application-or research-oriented duties in accordance with the potential social, economic and cultural impact.

Cycle	WiSe	
Content	Focus of the course "Advanced topics of waste resource management" lies on the organisational structures in waste management - such as planning, financing and logistics. One excursion will be offered to take part in (incineration plant, vehicle fleet and waste collection systems). The course is split into two parts: 1. part: "Conventional" lecture (development of waste management, legislation, collection, transportation and organisation of waste management, costs, fees and revenues). 2. part: Project base learning: You will get a project to work out in groups of 4 to 6 students; all tools and data you need to work out the project were given before during the conventional lecture. Course documents are published in StudIP and communication during project work takes place via StudIP. The results of the project work are presented at the end of the semester. The final mark for the course consists of the grade for the presentation.

Recommended Previous Knowledge	Knowledge of water management and the key processes involved in water treatment.				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional					
Competence					
Knowledge	Students will be able to outline key areas of conflict in water management, as well as their mutual dependence for sustainable water supply. They will understand relevant economic, environmental and social factors. Students will be able to explain and outline the organisational structures of water companies. They will be able to explain the available water treatment processes and the scope of their application.				
Skills	Students will be able to assess complex problems in drinking water production and establish solutions involving water management and technical measures. They will be able to assess the evaluation methods that can be used for this. Students will be able to carry out chemical calculations for selected treatment processes and apply generally accepted technical rules and standards to these processes.				
Personal					
Competence					
Social Competence	Working in a diverse group of specialists, students will be able to develop and document complex solutions for the management and treatment of drinking water. They will be able to take an appropriate professional position, for example representing user interests. They will be able to develop joint solutions in teams of diverse experts and present these solutions to others.				
Autonomy	Students will be in a position to work on a subject independently and present on this subject.

Тур	Lecture
Hrs/wk	2
СР	1
Workload in Hours	Independent Study Time 2, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	DE
Cycle	WiSe
Content	The topic of this course is water chemistry with respect to drinking water treatment and water distribution Major topics are solubility of gases, carbonic acid system and calcium carbonate, blending, softening, redox processes, materials and legal requirements on drinking water treatment. Focus is put on generally accepted rules of technology (DVGW- and DIN-standards). Special emphasis is put on calculations using realistic analysis data (e.g. calculation of pH or calcium carbonate dissolution potential) in exercises. Students can get a feedback and gain extra points for exam by solving problems for homework. Knowledge of drinking water treatment processes is vital for this lecture. Therefore the most important processes are explained coordinated with the course " Water resources management" in the beginning of the semester.

Content	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis.

Content	In this course selected drinking water treatment processes (e.g. aeration or activated carbon adsorption) are modeled dynamically using the programming language Modelica, that is increasingly used in industry. In this course OpenModelica is used, an free access frontend of the programming language Modelica. In the beginning of the course the use of OpenModelica is explainded by means of simple examples. Together required elements and structure of the model are developed. The implementation in OpenModelica and the application of the model is done individually or in groups respectively. Students get feedback and can gain extra points for the exam.

Course L0942: Rural D	Development and Resources Oriented Sanitation for different Climate Zones	
Тур	Seminar	
Hrs/wk	2	
СР	3	
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28	
Lecturer	Prof. Ralf Otterpohl	
Language	EN	
Cycle	WiSe	
Content	 Central part of this module is a group work on a subtopic of the lectures. The focus of these projects will be based on an interview with a target audience, practitioners or scientists. The group work is divided into several Milestones and Assignments. The outcome will be presented in a final presentation at the end of the semester.

Module M0981: C	Operation of Public Transportati	on Systems		
Courses				
Title Operation of Public Trans	portation Systems (L1179)	Typ Project-/problem-based Learning	Hrs/wk 4	CP 6
Module Responsible	Prof. Carsten Gertz			
Admission Requirements	None			
Recommended Previous Knowledge	some knowledge of transport planning, e.g Planning and Traffic Engineering"	i. through taking the under	graduate cl	ass "Transpol
Educational Objectives	After taking part successfully, students have	e reached the following lea	arning resu	Its
Professional Competence				
Knowledge	 Students are able to: describe public transport (PT) systems in technical language. outline the entire PT system including the interdependencies of the different elements. explain the requirements for a PT system from different perspectives. explain the role of PT in the transport system. 			
Skills	 Students are able to: systematically develop a public transport system when there are no clear cut correct or incorrect approaches. cope with imprecise and incomplete data. develop and appraise alternative solutions. distinguish or develop appropriate methods of analysis and modes of presentation. reflect and evaluate their own transport concept, considering competing requirements 			
Personal Competence	Students are able to:			
Social Competence	 carry out and complete a group pro constructively provide and accept for 		oriate alloca	ation of tasks.
Autonomy	 independently develop a bus PT condition determine and justify the focus of the organize and follow their work procondependently author a written reported assess the consequences of the some some sequences of the some sequen	eir work. ess regarding time and co ort.

Workload in Hours	Independent Study Time 124, Study Time in Lecture 56
Lecturer	Prof. Carsten Gertz
Language	DE
Cycle	WiSe
Content	The course primarily deals with the planning and operational challenges of public transpo systems. A bus-system is the example for studying these problems in depth. The followin topics and systemic elements are covered: PT network planning timetabling operational concepts requirements for vehicle technology and operation infrastructural requirements inter- and multimodal connections financing and competition organisational structures The topics are discussed with guests lecturers from the public transport sector and ar considered in practice during an excursion.

Course L0203: Air Pol	lution Abatement		
Тур	Lecture		
Hrs/wk	2		
СР	3		
Workload in Hours	rs Independent Study Time 62, Study Time in Lecture 28		
Lecturer	Dr. Ernst-Ulrich Hartge		
Language	EN		
Cycle	WiSe		
Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.

Module M0703: S	oil and Groundwater Contamir	nation		
Courses				
Title Contamination and Remediation (L0547) NAPL in Soil and Groundwater (L0545) NAPL in Soil and Groundwater (L0546)		Typ Project Seminar Lecture Recitation Section (small)	Hrs/wk 3 1 2	CP 3 1 2
Module Responsible	Prof. Wilfried Schneider			
Admission Requirements	None			
Recommended Previous Knowledge	 Ground water hydrology Geohydraulic and solute transport Hydromechanics 			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence Knowledge	The students are able to analyse contamination in soils and groundwater. They are able to create remediation concepts for LNAPL contamnations. They are faminliar with Monitored Natural Attenuation			
Skills	The students are able to analyse contaminations in soils and groundwater using special engineering methods. They can do transport modelling in the unsaturated zone, estimations of groundwater pollution and analyse the impacts of remediation measures. They can forecast die distribution, mobility and remediation of non aquaous phase liquids in soil and groundwater.			
Personal				
Competence				
Social Competence	The students are able to prepare complex contamination issues in teamwork and are able to find remediation measures.			
Autonomy				
	Independent Study Time 96, Study Time in	1 Lecture 84

Deep Geothermal Energy	(L0025)	Lecture	2	2	
Module Responsible	Prof. Martin Kaltschmitt				
Admission Requirements	None				
	Module: Technical Thermodynamics I				
Recommended Previous Knowledge	nded edge Module: Technical Thermodynamics II				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional					
Competence					
Knowledge	Students are able to describe the processes in energy trading and the design of energy markets and can critically evaluate them in relation to current subject specific problems Furthermore, they are able to explain the basics of thermodynamics of electrochemical energy conversion in fuel cells and can establish and explain the relationship to different types of fue cells and their respective structure. Students can compare this technology with other energy storage options. In addition, students can give an overview of the procedure and the energetic involvement of deep geothermal energy.				
Skills	Students can apply the learned knowledge of storage systems for excessive energy to explain for various energy systems different approaches to ensure a secure energy supply. In particular, they can plan and calculate domestic, commercial and industrial heating equipment using energy storage systems in an energy-efficient way and can assess them in relation to complex power systems. In this context, students can assess the potential and limits of geothermal power plants and explain their operating mode.				
	Furthermore, the students are able to explain the procedures and strategies for marketing o energy and apply it in the context of other modules on renewable energy projects. In this context they can unassistedly carry out analysis and evaluations of energie markets and energy trades.				
Personal					
Competence					
Social Competence	Students are able to discuss issues in the thematic fields in the renewable energy sector addressed within the module.				
Autonomy	Students can independently exploit sources, acquire the particular knowledge about the subject area and transform it to new questions.

Recommended Previous Knowledge	,			
Educational Objectives	After taking part successfully, studen	ts have reached the following le	arning resu	lts
Professional Competence				
Knowledge	The students can name, describe current issue and problems in the field of thermal waste treatment and particle process engineering and contemplate them in the context of their field. The industrial application of unit operations as part of process engineering is explained by actual examples of waste incineration technologies and solid biomass processes. Compostion, particle sizes, transportation and dosing, drying and agglomeration of renewable resources and wastes are described as important unit operations when producing solid fuels and bioethanol, producing and refining edible oils, electricity , heat and mineral recyclables.			
Skills	The students are able to select suitable processes for the treatment of wastes or raw materia with respect to their characteristics and the process aims. They can evaluate the efforts and costs for processes and select economically feasible treatment concepts.			
Personal				
Competence				
Social Competence	 Students can respectfully work together as a team and discuss technical tasks participate in subject-specific and interdisciplinary discussions, develop cooperated solutions promote the scientific development and accept professional constructive criticism. 			
Autonomy	Students can independently tap knowledge of the subject area and transform it to new questions. They are capable, in consultation with supervisors, to assess their learning level and define further steps on this basis. Furthermore, they can define targets for new application-or research-oriented duties in accordance with the potential social, economic and cultural impact.

Content	The part Contaminated Sites gives an introduction into different scales of pollution and identifies key pollutants. Geochemical attenuation mechanisms and the role of organisms are highlighted affecting the fate of pollutants in leachate and groundwater. Techniques for site characterization and remediation are discussed including economical aspects. The part Landfilling is introduced by discussing fundamental aspects and the worldwide situation of waste management. The lecture highlights transformation processes in landfill bodies, emissions of gases and leachate, and the long-term behaviour of landfill sites with measures of aftercare.

Content	As an introduction cases are presented in which geochemical engineering was used to solve environmental problems. Environmentally important minerals are discussed and methods for their detection. It is demonstrated how solution equilibria can be modified to eliminate elevated concentrations of unwanted species in solution and how carbon dioxide concentration affects pH and the dissolution of carbonate minerals. Modifications of redox conditions, pH, and electrolyte concentration are shown to be effective tools for controlling the mobility and fate of hazardous species in the environment.

Content	 "Principles of Urban Planning" deals with the determinants of urban development and their interactions. Topics include: legal framework, instruments and methods of planning, functional requirements, stakeholders and actors basic design requirements different planning levels and historical contexts. The objective of the course is for students to acquire a basic understanding of urban development problems and approaches for solving them. They will also be able to comprehend the process of urban planning. The project work deals with a real life scenario and includes drawing up a development plan, an urban design concept as well as a building masterplan.

Content	 "Designing Urban Streetscapes" covers the various functional and aesthetic requirements for designing streetscape as the most important elements of public space. The class deals with: technical and design requirements, the effects of streetscapes on the behaviour of their users, possible measures relating to changes in traffic development. For their applied project, students will be required to redesign the streetscape of an actual case study.

Cycle	WiSe		
Content	 Focus of the course "Advanced topics of waste resource management" lies on the organisational structures in waste management - such as planning, financing and logistics. One excursion will be offered to take part in (incineration plant, vehicle fleet and waste collection systems). The course is split into two parts: part: "Conventional" lecture (development of waste management, legislation, collection, transportation and organisation of waste management, costs, fees and revenues). part: Project base learning: You will get a project to work out in groups of 4 to 6 students; all tools and data you need to work out the project were given before during the conventional lecture. Course documents are published in StudIP and communication during project work takes place via StudIP. The results of the project work are presented at the end of the semester. The final mark for the course consists of the grade for the presentation.

Courses						
Title		Тур	Hrs/wk	СР		
Chemistry of Drinking Water Treatment (L0311)		Lecture	2	1		
Chemistry of Drinking Water Treatment (L0312)		Recitation Section (large)	1	2		
Water Resource Management (L0402)		Lecture	2	2		
Water Resource Manager	ment (L0403)	Recitation Section (small)	1	1		
Module Responsible	Prof. Mathias Ernst					
Admission Requirements	None					
Recommended Previous Knowledge	Knowledge of water management and the key processes involved in water treatment.					
Educational Objectives	After taking part successfully, students have reached the following learning results					
Professional						
Competence						
Knowledge	Students will be able to outline key areas of conflict in water management, as well as their mutual dependence for sustainable water supply. They will understand relevant economic, environmental and social factors. Students will be able to explain and outline the organisational structures of water companies. They will be able to explain the available water treatment processes and the scope of their application.					
Skills	Students will be able to assess complex problems in drinking water production and establish solutions involving water management and technical measures. They will be able to assess the evaluation methods that can be used for this. Students will be able to carry out chemical calculations for selected treatment processes and apply generally accepted technical rules and standards to these processes.					
Personal Competence						
Social Competence	Working in a diverse group of specialists, students will be able to develop and document complex solutions for the management and treatment of drinking water. They will be able to take an appropriate professional position, for example representing user interests. They will be able to develop joint solutions in teams of diverse experts and present these solutions to others.					
Autonomy	Students will be in a position to work on a subject independently and present on this subject.					
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84

Course L0311: Chemis	stry of Drinking Water Treatment
Тур	Lecture
Hrs/wk	2
СР	1
Workload in Hours	Independent Study Time 2, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	DE
Cycle	WiSe
Content	The topic of this course is water chemistry with respect to drinking water treatment and water distribution Major topics are solubility of gases, carbonic acid system and calcium carbonate, blending, softening, redox processes, materials and legal requirements on drinking water treatment. Focus is put on generally accepted rules of technology (DVGW- and DIN-standards). Special emphasis is put on calculations using realistic analysis data (e.g. calculation of pH or calcium carbonate dissolution potential) in exercises. Students can get a feedback and gain extra points for exam by solving problems for homework. Knowledge of drinking water treatment processes is vital for this lecture. Therefore the most important processes are explained coordinated with the course " Water resources management" in the beginning of the semester.

Content	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis.

Content	In this course selected drinking water treatment processes (e.g. aeration or activated carbon adsorption) are modeled dynamically using the programming language Modelica, that is increasingly used in industry. In this course OpenModelica is used, an free access frontend of the programming language Modelica. In the beginning of the course the use of OpenModelica is explainded by means of simple examples. Together required elements and structure of the model are developed. The implementation in OpenModelica and the application of the model is done individually or in groups respectively. Students get feedback and can gain extra points for the exam.

Admission Requirements	None				
Recommended Previous Knowledge	 Ground water hydrology Hydromechanics 				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	The students are able to describe the fate of solutes in the subsurface along the path between soil and water body quantitatively and qualitatively. They are able to do this with simulation models.				
Skills	The students are able to describe conceptually movement and storage of water in the unsaturated zone. They are able to analyse pF- functions and Ku functions. They can mode transport of solutes in the unsaturated and saturated zoned. They are able to determine dispersiities, sorption coefficients, decay rates and dissolution rates for organic and inorganic substances.				
Personal					
Competence	-				
	The students can help to each other.

Content	The topic of this course is water chemistry with respect to drinking water treatment and water distribution Major topics are solubility of gases, carbonic acid system and calcium carbonate, blending, softening, redox processes, materials and legal requirements on drinking water treatment. Focus is put on generally accepted rules of technology (DVGW- and DIN-standards). Special emphasis is put on calculations using realistic analysis data (e.g. calculation of pH or calcium carbonate dissolution potential) in exercises. Students can get a feedback and gain extra points for exam by solving problems for homework. Knowledge of drinking water treatment processes is vital for this lecture. Therefore the most important processes are explained coordinated with the course " Water resources management" in the beginning of the semester.

Content	The part Contaminated Sites gives an introduction into different scales of pollution and identifies key pollutants. Geochemical attenuation mechanisms and the role of organisms are highlighted affecting the fate of pollutants in leachate and groundwater. Techniques for site characterization and remediation are discussed including economical aspects. The part Landfilling is introduced by discussing fundamental aspects and the worldwide situation of waste management. The lecture highlights transformation processes in landfill bodies, emissions of gases and leachate, and the long-term behaviour of landfill sites with measures of aftercare.

Content	As an introduction cases are presented in which geochemical engineering was used to solve environmental problems. Environmentally important minerals are discussed and methods for their detection. It is demonstrated how solution equilibria can be modified to eliminate elevated concentrations of unwanted species in solution and how carbon dioxide concentration affects pH and the dissolution of carbonate minerals. Modifications of redox conditions, pH, and electrolyte concentration are shown to be effective tools for controlling the mobility and fate of hazardous species in the environment.

Nature-Onented Hydraulic		Learning	2	2
Module Responsible				
Admission Requirements	None			
	Fundamentals of Hydromechanics, Hydrau Hydraulic Engineering I and Hydraulic Engine		Hydraulic	Engineering
Educational Objectives	After taking part successfully, students have re	eached the following lea	arning resu	lts
Professional Competence				
Knowledge	Students are able to define in detail the basic processes that are related to the modelling o flows in hydraulic engineering. Besides, they can describe the basic aspects of numerica modelling and actual numerical models for the simulation of flows and waves. They can also depict the concepts of nature oriented hydraulic engineering.			
Skills	Students are able to apply hydrodynamic-numerical models to practical hydraulic engineering tasks. Furthermore, the students are able to set up flood-risk management concepts and are able to apply basic concepts of renaturation to practical problems.			
Personal Competence				
Social Competence	The students are able to deploy their gained knowledge in applied problems of the practical nature-based hydraulic engineering. Additionaly, they will be able to work in team with engineers of other disciplines.			
Autonomy	The students will be able to independently extend their knowledge and apply it to new problems.			
Workload in Hours	Independent Study Time 110, Study Time in L	ecture 70

Content	 "Principles of Urban Planning" deals with the determinants of urban development and their interactions. Topics include: legal framework, instruments and methods of planning, functional requirements, stakeholders and actors basic design requirements different planning levels and historical contexts. The objective of the course is for students to acquire a basic understanding of urban development problems and approaches for solving them. They will also be able to comprehend the process of urban planning. The project work deals with a real life scenario and includes drawing up a development plan, an urban design concept as well as a building masterplan.

Content	 Focus of the course "Advanced topics of waste resource management" lies on the organisational structures in waste management - such as planning, financing and logistics. One excursion will be offered to take part in (incineration plant, vehicle fleet and waste collection systems). The course is split into two parts: part: "Conventional" lecture (development of waste management, legislation, collection, transportation and organisation of waste management, costs, fees and revenues). part: Project base learning: You will get a project to work out in groups of 4 to 6 students; all tools and data you need to work out the project were given before during the conventional lecture. Course documents are published in StudIP and communication during project work takes place via StudIP. The results of the project work are presented at the end of the semester. The final mark for the course consists of the grade for the presentation.

Content	In this course selected drinking water treatment processes (e.g. aeration or activated carbo adsorption) are modeled dynamically using the programming language Modelica, that increasingly used in industry. In this course OpenModelica is used, an free access frontend the programming language Modelica. In the beginning of the course the use of OpenModelica is explainded by means of simp examples. Together required elements and structure of the model are developed. The implementation in OpenModelica and the application of the model is done individually or groups respectively. Students get feedback and can gain extra points for the exam.

Content	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis.

Module Responsible	Dr. Dorothea Rechtenbach			
Admission Requirements	Nono			
Recommended Previous Knowledge	Basic knowledge in chemistry and physics (knowledge acquired at school)			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	The students know basic analytical procedures for evaluating the quality of water and wastewater. They have knowledge about fundamental process engineering features o important water and wastewater treatment technologies.			
Skills	The students are able to understand and to practically apply methodologies for wastewater analysis as well as descriptions of experiments and experimental setups in wastewater technology.			
Personal				
Competence Social Competence				
Autonomy	The students are able to conduct experiments following written procedures without external assistance.

Cycle	WiSe	
Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.

Courses				
Title	Typ Hrs/wk CP			
Module Responsible				
Admission Requirements	None			
Recommended Previous Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
	The students are able to demonstrate their detailed knowledge in the field of Water an Environmental Engineering. They can exemplify the state of technology and application and discuss critically in the context of actual problems and general conditions of science an society.			
Knowledge	The students can develop solving strategies and approaches for fundamental and practic problems in the field of Water and Environmental Engineering. They may apply theory base procedures and integrate safety-related, ecological, ethical, and economic view points science and society.			
	Scientific work techniques that are used can be described and critically reviewed.			
Skills	The students are able to independently select methods or planning approaches for the proje work and to justify their choice. They can explain how these methods or approaches relate solutions in the field of work and how the context of application has to be adjusted. Gener findings and further developments may essentially be outlined.			
Personal Competence				
Social Competence	The students are able to condense the relevance and the structure of the project work, the work steps and the sub-problems for the presentation and discussion in front of a bigg group. They can lead the discussion and give a feedback on the project to their colleagues.			
Autonomy	The students are capable of independently planning and documenting the work steps and procedures while considering the given deadlines. This includes the ability to accurately procure the newest scientific information. Furthermore, they can obtain feedback from experts with regard to the progress of the work, and to accomplish results on the state of the art in science and technology.

Educational Objectives	After taking part successfully, students have reached the following	learning resu	lts
Professional Competence			
Knowledge	Students can describe resources oriented wastewater systems mainly based on source control in detail. They can comment on techniques designed for reuse of water, nutrients ar soil conditioners. ^e Students are able to discuss a wide range of proven approaches in Rural Development fro and for many regions of the world.		
Skills	Students are able to design low-tech/low-cost sanitation, rural water supply, rainwat harvesting systems, measures for the rehabilitation of top soil quality combined with food a water security. Students can consult on the basics of soil building through "Holisitc Planne Grazing" as developed by Allan Savory.		
Personal Competence			
	The students are able to develop a specific topic in a team a according to a given plan.	nd to work c	out mileston
Autonomy	Students are in a position to work on a subject and to organize their work flow independently. They can also present on this subject.
