| Discrete Algebraic Structures (L016 | 4)   | Lecture  | 2                  | 3                     |  |
| Discrete Algebraic Structures (L016 | Discrete Algebraic Structures (L0165) Recitation Section (small) 2 3   |  |                    |                       |  |
| Module Responsible                  | Prof. Karl-Heinz Zimmermann  |  |                    |                       |  |
| Admission Requirements              | None   |  |                    |                       |  |
| Recommended Previous                | Mathematics from High School.  |  |                    |                       |  |
| Knowledge                           |  |  |                    |                       |  |
| Educational Objectives              | After taking part successfully, students ha  | ave reached the following learning results         |                    |                       |  |
| Professional Competence             |  |  |                    |                       |  |
| Knowledge                           | The students know the important basics   | of discrete algebraic structures including element | tary combinatorial | structures, monoids,  |  |
|                                     | groups, rings, fields, finite fields, and vect   | or spaces. They also know specific structures like | sub sum-, and qu   | otient structures and |  |
|                                     | homomorphisms.   |  |                    |                       |  |
|                                     |  |  |                    |                       |  |
| Skills                              | Students are able to formalize and analyze basic discrete algebraic structures.  |  |                    |                       |  |
| Personal Competence                 |  |  |                    |                       |  |
| Social Competence                   | Students are able to solve specific problems alone or in a group and to present the results accordingly.                 |  |                    |                       |  |
|                                     | 3,   |  |                    |                       |  |
| Autonomy                            | Students are able to acquire new knowledge from specific standard books and to associate the acquired knowledge to other |  |                    |                       |  |
|                                     | classes.   |  |                    |                       |  |
|                                     |  |  |                    |                       |  |
|                                     |  |  |                    |                       |  |
| Workload in Hours                   | Independent Study Time 124, Study Time   | in Lecture 56                                      |                    |                       |  |
| Credit points                       | 6  |  |                    |                       |  |

| Module Responsible             | Prof. Sibylle Schupp  |                                       |                 |        |  |
| Admission Requirements         | None  |                                       |                 |        |  |
| Recommended Previous           | Discrete mathematics at high-school level   |                                       |                 |        |  |
| Knowledge                      |   |                                       |                 |        |  |
| Educational Objectives         | After taking part successfully, students have reached the   | following learning results            |                 |        |  |
| Professional Competence        |   |                                       |                 |        |  |
| Knowledge                      | Students apply the principles, constructs, and simple design techniques of functional programming. They demonstrate their ability to read Haskell programs and to explain Haskell syntax as well as Haskell's read-eval-print loop. They interpret warnings and find errors in programs. They apply the fundamental data structures, data types, and type constructors. They employ strategies for unit tests of functions and simple proof techniques for partial and total correctness. They distinguish laziness from other evaluation strategies. |                                       |                 |        |  |
| Skills                         | Students break a natural-language description down in parts amenable to a formal specification and develop a functional program in a structured way. They assess different language constructs, make conscious selections both at specification and implementations level, and justify their choice. They analyze given programs and rewrite them in a controlled way. They design and implement unit tests and can assess the quality of their tests. They argue for the correctness of their program.   |                                       |                 |        |  |
| Personal Competence            |   |                                       |                 |        |  |
| Social Competence              | Students practice peer programming with varying peers. They explain problems and solutions to their peer. They defend their programs orally. They communicate in English.   |                                       |                 |        |  |
| Autonomy                       | In programming labs, students learn under supervision (a.k.a. "Betreutes Programmieren") the mechanics of programming. In exercises, they develop solutions individually and independently, and receive feedback.   |                                       |                 |        |  |
| Workload in Hours              | Independent Study Time 96, Study Time in Lecture 84   |                                       |                 |        |  |
| Credit points                  |   |                                       |                 |        |  |
| Course achievement             | Compulsory Bonus Form Descri  | ption                                 |                 |        |  |
|                                | Yes 15 % Excercises   |                                       |                 |        |  |

| Knowledge   |  |  |
| <b>Educational Objectives</b>                     | After taking part successfully, students have reached the following learning results |  |
| Professional Competence                           |  |  |

Knowledae

#### The Non-technical Academic Programms (NTA)

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

#### The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles'

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

#### Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

#### Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goaloriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

#### The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

#### Specialized Competence (Knowledge)

Students can

- locate selected specialized areas with the relevant non-technical mother discipline,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

#### Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic methods of the said scientific disciplines,
- auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist
- to handle simple questions in aforementioned scientific disciplines in a sucsessful manner.
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

#### Personal Competence

Social Competence

### Personal Competences (Social Skills)

Students will be able

· to learn to collaborate in different manner.

| Autonomy  Personal Competences (Self-reliance)  Students are able in selected areas  • to reflect on their own profession and professionalism in the context of real-life fields of application  • to organize themselves and their own learning processes  • to reflect and decide questions in front of a broad education background  • to communicate a nontechnical item in a competent way in writen form or verbaly  • to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) |  |
|--|--|
| Workload in Hours Depends on choice of courses  Credit points 6  |  |

### Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

| Knowledge                             | - specify algorithms for simple data structu  | ires (such as, e.g., arrays) to solve computationa | problems          |    |
|                                       | - apply propositional logic and predicate lo  | gic for specifying and understanding mathematic    | al proofs         |    |
|                                       | - apply the knowledge and skills taught in  | the module Discrete Algebraic Structures           |                   |    |
| <b>Educational Objectives</b>         | After taking part successfully, students ha   | ve reached the following learning results          |                   |    |
| <b>Professional Competence</b>        |   |  |                   |    |
| Skills                                | Students can explain syntax, semantics, and decision problems of propositional logic, and they are able to give algorithms for solving decision problems. Students can show correspondences to Boolean algebra. Students can describe which application problems are hard to represent with propositional logic, and therefore, the students can motivate predicate logic, and define syntax, semantics, and decision problems for this representation formalism. Students can explain unification and resolution for solving the predicate logic SAT decision problem. Students can also describe syntax, semantics, and decision problems for various kinds of temporal logic, and identify their application areas. The participants of the course can define various kinds of finite automata and can identify relationships to logic and formal grammars. The spectrum that students can explain ranges from deterministic and nondeterministic finite automata and pushdown automata to Turing machines. Students can name those formalism for which nondeterminism is more expressive than determinism. They are also able to demonstrate which decision problems require which expressivity, and, in addition, students can transform decision problems w.r.t. one formalism into decision problems w.r.t. other formalisms. They understand that some formalisms easily induce algorithms whereas others are best suited for specifying systems and their properties. Students can describe the relationships between formalisms such as logic, automata, or grammars.  Students can apply propositional logic as well as predicate logic resolution to a given set of formulas. Students analyze application problems in order to derive propositional logic, predicate logic, or temporal logic formulas to represent them. They can evaluate which formalism is best suited for a particular application problem, and they can demonstrate the application of algorithms for decision problems to specific formulas. Students can also transform nondeterministic automata into deterministic ones, or derive |  |                   |    |

| Content    | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.  |
|            | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on so selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

| After taking part successfully, students have reached  | the following learning results   |  |   |
|  |  |  |   |
| The students have a fundamental understanding of object orientated and generic programming and can apply it in small programming projects. The can design own class hierarchies and differentiate between different ways of inheritance. They have a fundamental understanding of polymorphism and can differentiate between run-time and compile-time polymorphism. The students know the concept of information hiding and can design interfaces with public and private methods. They can use exceptions and apply generic programming in order to make existing data structures generic. The students know the pros and cons of both programming paradigms.  Students can break down a medium-sized problem into subproblems and create their own classes in an object-oriented programming language based on these subproblems. They can design a public and private interface and implement the implementation generically and extensible by abstraction. They can distinguish different language constructs of a modern   |  |  |   |

| Content   | In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs.  In the second part of the lecture an introduction to Internet security is given.  This class comprises:  Application layer protocols (HTTP, FTP, DNS)  Transport layer protocols (TCP, UDP)  Network Layer (Internet Protocol, routing in the Internet)  Data link layer with media access at the example of Ethernet  Multimedia applications in the Internet  Network management |  |

| Recommended Previous         | Basic knowledge in electrical engineering  |                                     |                  |                       |
| Knowledge                    |  |                                     |                  |                       |
| Educational Objectives       | After taking part successfully, students have reached the follo  | wing learning results               |                  |                       |
| Professional Competence      |  |                                     |                  |                       |
| Knowledge                    | This module deals with the foundations of the functionality  |                                     | the layers fron  | n the assembly-level  |
|                              | programming down to gates. The module includes the following   | ng topics:                          |                  |                       |
|                              | Introduction   |                                     |                  |                       |
|                              | Combinational logic: Gates, Boolean algebra, Boolean f   | unctions, hardware synthesis, cor   | mbinational net  | works                 |
|                              | Sequential logic: Flip-flops, automata, systematic hards   | vare design                         |                  |                       |
|                              | Technological foundations  |                                     |                  |                       |
|                              | Computer arithmetic: Integer addition, subtraction, mu   | •                                   |                  |                       |
|                              | Basics of computer architecture: Programming models,     Magnetics Magnetics CRAM DRAM cooks.  | MIPS single-cycle architecture, p   | ipelining        |                       |
|                              | <ul> <li>Memories: Memory hierarchies, SRAM, DRAM, caches</li> <li>Input/output: I/O from the perspective of the CPU, princ</li> </ul> | inles of passing data, point to po  | int connections  | hussos                |
|                              | imput/output. I/O from the perspective of the CFO, princ   | iples of passing data, politi-to-po | inc connections, | busses                |
| Skills                       | The students perceive computer systems from the architect's  |                                     |                  |                       |
|                              | composition of computer systems. The students can analyze,   |                                     |                  |                       |
|                              | collection of few and simple components. They are able to c  |                                     | n the different  | abstraction layers of |
|                              | today's computing systems - from gates and circuits up to con  | nplete processors.                  |                  |                       |
|                              | After successful completion of the module, the students are  | able to judge the interdepende      | ncies between    | a physical computer   |
|                              | system and the software executed on it. In particular, they s  | nall understand the consequence     | s that the execu | ution of software has |
|                              | on the hardware-centric abstraction layers from the assembly   |                                     |                  |                       |
|                              | the impact that these low abstraction levels have on an entire   | system's performance and to pro     | opose feasible o | ptions.               |
| Personal Competence          |  |                                     |                  |                       |
| Social Competence            | Students are able to solve similar problems alone or in a grou   | p and to present the results accor  | rdingly.         |                       |
| Autonomy                     | Students are able to acquire new knowledge from specific lite  | rature and to accociate this know   | ladga with atha  | r classes             |
| Autonomy                     | Students are able to acquire new knowledge from specific lite  | rature and to associate this know   | leage with othe  | Classes.              |

| Knowledge                |  |
| Educational Objectives   | After taking part successfully, students have reached the following learning results   |
| Professional Competence  |  |
| Knowledge                | Students know the important aspects and phases of software development.  |
| Skills                   | Students can describe the typical phases of software development and are able to contribute to a software project.               |
| Personal Competence      |  |
| Social Competence        | Students are able to specify, implement, and analyze specific basic topics in software development and present them accordingly. |
| Autonomy                 | Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.          |
| Workload in Hours        | Independent Study Time 180, Study Time in Lecture 0  |

|  |   |  |  |
| Admission Requirements None  |   |  |  |
| Administrative ments into the  |   |  |  |
| Recommended Previous Students should have basic knowledge in the following areas:  |   |  |  |
| Knowledge  |   |  |  |
| Discrete Algebraic Structures  |   |  |  |
| Procedural Programming   |   |  |  |
| Automata Theory and Formal Languages   |   |  |  |
| Programming Paradigms  |   |  |  |
| Educational Objectives After taking part successfully, students have reached the following learning results  |   |  |  |
| Professional Competence  |   |  |  |
| Knowledge After successful completion of the course, students know:  |   |  |  |
| Design instruments for relational databases  |   |  |  |
| The relational model   |   |  |  |
| Relational query languages, especially SQL   |   |  |  |
| Requirements on data integrity   |   |  |  |
| Possibilities for query optimization   |   |  |  |
| <ul> <li>Aspects of transaction handling, fault handling and concurrency/synchronization in database systems</li> </ul>  |   |  |  |
| <ul> <li>Specific attributes and differences of object-oriented and object-relational databases</li> </ul>   |   |  |  |
| <ul> <li>Paradigms and concepts of current technologies for data modelling and database systems</li> </ul>   |   |  |  |
| Skills The students acquire the ability to model a database and to work with it. This comprises especially the applicat  | The students acquire the ability to model a database and to work with it. This comprises especially the application of design |  |  |
| methodologies and query and definition languages. Furthermore, students are able to apply basic functionalities nee  |   |  |  |
| database.  | caca to rain a  |  |  |
| Proceed Community of the Community of th |   |  |  |
| Personal Competence  | and the state of  |  |  |
| Social Competence Students can work on complex problems both independently and in teams. They can exchange ideas with each other   | and use their   |  |  |
| individual strengths to solve the problem.   |   |  |  |
| Autonomy Students are able to independently investigate a complex problem and assess which competencies are required to so   | olve it.  |  |  |
| Workload in Hours Independent Study Time 124, Study Time in Lecture 56   |   |  |  |
| Credit points 6  |   |  |  |
| Course achievement None  |   |  |  |
| Examination Written exam   |   |  |  |
| Examination duration and 120 min   |   |  |  |
| scale  |   |  |  |

| Educational Objectives   | After taking part successfully, students have reached   | the following learning results                  |               |             |  |  |
| Professional Competence  |   |   |               |             |  |  |
| Skills  Personal Competence  Social Competence                           | This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for general-purpose computers and for special-purpose machines (e.g., signal processors). Next, foundational aspects of the micro-architecture of processors are covered. Here, the focus particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies.  The students are able to describe the organization of processors. They know the different architectural principles and programming models. The students examine various structures of pipelined processor architectures and are able to explain their concepts and to analyze them w.r.t. criteria like, e.g., performance or energy efficiency. They evaluate different structures of memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism.  Students are able to solve similar problems alone or in a group and to present the results accordingly. |   |               |             |  |  |
| Autonomy   | Students are able to acquire new knowledge from spe   | sellic literature and to associate this knowled | age with othe | ir classes. |  |  |

| Educational Objectives   | After taking part successfully, students have reach  | ned the following learning results                  |                  |                     |
| Professional Competence  |  |   |                  |                     |
|  | Students explain the workings of a compiler and break down a compilation task in different phases. They apply and modify the major algorithms for compiler construction and code improvement. They can re-write those algorithms in a programming language, run and test them. They choose appropriate internal languages and representations and justify their choice. They explain and modify implementations of existing compiler frameworks and experiment with frameworks and tools.  Students design and implement arbitrary compilation phases. They integrate their code in existing compiler frameworks. They |   |                  |                     |
|  | organize their compiler code properly as a software project. They generalize algorithms for compiler construction to algorithms that analyze or synthesize software.   |   |                  |                     |
| <b>Personal Competence</b>   |  |   |                  |                     |
| Social Competence  | Students develop the software in a team. They explain problems and solutions to their team members. They present and defend their software in class. They communicate in English.  |   |                  |                     |
| Autonomy   | Students develop their software independently and define milestones by themselves. They receive feedback throughout the entire project. They organize the software project so that they can assess their progress themselves.  |   |                  |                     |

| Knowledge                                       | Experience with Developing Small to Medium-Size Program  | ns   |             |             |
| Educational<br>Objectives                       | After taking part successfully, students have reached the following  | ng learning results                            |             |             |
| Professional                                    |  |  |             |             |
| Competence                                      |  |  |             |             |
| Knowledge                                       | Students explain the fundamental concepts of agile methods, describe the process of test-driven development, and explain how continuous integration can be used in different scenarios. They give examples of selected pitfalls in software development, regarding scalability and other non-functional requirements. They write unit tests and build scripts and combine them in a corresponding integration environment. They explain major activities in requirements analysis, program comprehension, and agile project development. |  |             |             |
| Skills  | For a given task on a legacy system, students identify the corresponding parts in the system and select an appropriate method for understanding the details. They choose the proper approach of splitting a task in independent testable and extensible pieces and, thus, solve the task with proper methods for quality assurance. They design tests for legacy systems, create automated builds, and find errors at different levels. They integrate the resulting artifacts in a continuous development environment                   |  |             |             |
| Personal  |  |  |             |             |

| Social  | Students discuss different design decisions in a group. They defe  | nd their solutions orally. They communicate in | English.    |             |
| Competence<br>Autonomy                          | Using accompanying tools, students can assess their level of knowledge continuously and adjust it appropriately. Within limits, they can set their ow goals. Upon successful completion, students can identify and formulate concrete problems of software systems and propose solutions. Within this field conduct independent studies to acquire the necessary competencies. They can devise plans to arrive at new solutions or assess existing ones.   |  |             |             |

| Title                           | Typ Hrs/wk CP  |  |  |
| Numerical Mathematics I (L0417) | Lecture 2 3  |  |  |
| Numerical Mathematics I (L0418) | Recitation Section (small) 2 3   |  |  |
| Module Responsible              | Prof. Sabine Le Borne  |  |  |
| Admission Requirements          | None   |  |  |
| Recommended Previous            | <ul> <li>Mathematik I + II for Engineering Students (german or english) or Analysis &amp; Linear Algebra I + II for Technomathematicians</li> </ul>  |  |  |
| Knowledge                       | basic MATLAB/Python knowledge  |  |  |
| Educational Objectives          | After taking part successfully, students have reached the following learning results   |  |  |
| Professional Competence         |  |  |  |
| Knowledge                       | Students are able to   |  |  |
|                                 | name numerical methods for interpolation, integration, least squares problems, eigenvalue problems, nonlinear root finding   |  |  |
|                                 | problems and to explain their core ideas,  |  |  |
|                                 | repeat convergence statements for the numerical methods,   |  |  |
|                                 | explain aspects for the practical execution of numerical methods with respect to computational and storage complexitx.   |  |  |
| Skills                          | Students are able to   |  |  |
|                                 | implement, apply and compare numerical methods using MATLAB/Python,  |  |  |
|                                 | <ul> <li>justify the convergence behaviour of numerical methods with respect to the problem and solution algorithm,</li> <li>select and execute a suitable solution approach for a given problem.</li> </ul>   |  |  |
| Personal Competence             |  |  |  |
|                                 | Students are able to   |  |  |
| Social Competence               | Stadents are able to   |  |  |
|                                 | <ul> <li>work together in heterogeneously composed teams (i.e., teams from different study programs and background knowledge),</li> <li>explain theoretical foundations and support each other with practical aspects regarding the implementation of algorithms.</li> </ul>   |  |  |
| Autonomy                        | Students are capable   |  |  |
|                                 | <ul> <li>to assess whether the supporting theoretical and practical excercises are better solved individually or in a team,</li> <li>to assess their individual progess and, if necessary, to ask questions and seek help.</li> </ul>  |  |  |
| Workload in Hours               | Independent Study Time 124, Study Time in Lecture 56   |  |  |
| Credit points                   |  |  |  |
| Course achievement              |  |  |  |
| Examination                     | Written exam   |  |  |
| Examination duration and scale  |  |  |  |

| Course L0417: Numerical Ma | thematics I   |
|----------------------------|---|
| Тур                        | Lecture   |
| Hrs/wk                     | 2   |
| СР                         | 3   |
| Workload in Hours          | Independent Study Time 62, Study Time in Lecture 28   |
| Lecturer                   | Prof. Sabine Le Borne   |
| Language                   | EN  |
| Cycle                      | WiSe  |
| Content                    | 1. Finite avecision with matrix array and late and distance and stability.  |
|                            | Finite precision arithmetic, error analysis, conditioning and stability     Linear systems of equations: LU and Cholesky factorization, condition |
|                            | Interpolation: polynomial, spline and trigonometric interpolation   |
|                            | Nonlinear equations: fixed point iteration, root finding algorithms, Newton's method  |
|                            | 5. Linear and nonlinear least squares problems: normal equations, Gram Schmidt and Householder orthogonalization, singular                        |
|                            | value decomposition, regularizatio, Gauss-Newton and Levenberg-Marguardt methods  |
|                            | 6. Eigenvalue problems: power iteration, inverse iteration, QR algorithm  |
|                            | 7. Numerical differentiation  |
|                            | 8. Numerical integration: Newton-Cotes rules, error estimates, Gauss quadrature, adaptive quadrature  |

| Educational Objectives                       | After taking part successfully, students have reached  | the following learning results   |        |           |
| Professional Competence  Knowledge           |  |                                  |        |           |
| Skills                                       | <ul> <li>Students can name the basic concepts in Mathematics IV. They are able to explain them using appropriate examples.</li> <li>Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.</li> <li>They know proof strategies and can reproduce them.</li> <li>Students can model problems in Mathematics IV with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.</li> <li>Students are able to discover and verify further logical connections between the concepts studied in the course.</li> <li>For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.</li> </ul>  |                                  |        |           |
| Personal Competence Social Competence        |  |                                  |        |           |
| Autonomy                                     | <ul> <li>Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</li> <li>Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.</li> </ul>   |                                  |        |           |

| Computational Geometry (10394)  Module Responsible D. Prashant Batra  Admission Requirements None  Recommended Previous Knowledge (Computing with vectors a. determinants, Interpretation of scalar product, cross-product, Representation of lines/planes, St. Pythagoras' theorem, cosine theorem, Thales' theorem, projections/embeddings)  Basic data structures (trees, binary trees, search trees, balanced binary trees, linked lists)  Definition of a graph  Educational Objectives  Professional Competence  Knowledge  Students can name the basic concepts of computer-assisted geometry, describe them with mathematical precision, and exit them by means of examples.  Students are conversant with the computational description of geometrical (combinational/topological) facts, including determ formulas and complexity assessments and proofs for all algorithms, especially output-sensitive algorithms.  Students are able to discuss logical connections between these concepts and to explain them by means of examples.  Skills  Students can model tasks from computer-assisted geometry with the aid of the concepts about which they have learnt and solve them by means of the methods they have learnt.  Personal Competence  Social Competence  Students are able to discuss with other attendees their own algorithmic suggestions for solving the problems presented. The also able to work in teams and are conversant with mathematics as a common language.  Autonomy  Students are capable of accessing independently further logical connections between the concepts about which they have land are able to verify them.   | Courses                         |   |                                 |                   |                       |

|                           | This lecture introduces into fundamental concepts, methods, and definitions in quantum mechanics, which are needed in modern material and device science. Applications will be discussed using examples in the field of electronic and optical devices.  Central topics are:  Schrödinger equation, wave function, operators, eigenstates, eigenvalues, quantum wells, harmonic oscillator, tunnel processes, resonant tunnel diode, band structure, density of states, quantum statistics, Zener-diode, stationary perturbation calculation with the quantum-confined Stark effect as an example, Fermi's golden rule and transition matrix elements, heterostructure laser, quantum cascade laser, many-particle physics, molecules and exchange interaction, quantum bits and quantum cryptography.   |

| Knowledge                         |  |
| Educational Objectives            | After taking part successfully, students have reached the following learning results   |
| Professional Competence           |  |
|                                   | Cyber-Physical Systems (CPS) are tightly integrated with their surrounding environment, via sensors, A/D and D/A converters, and actors. Due to their particular application areas, highly specialized sensors, processors and actors are common. Accordingly, there is a large variety of different specification approaches for CPS - in contrast to classical software engineering approaches.  Based on practical experiments using robot kits and computers, the basics of specification and modelling of CPS are taught. The lab introduces into the area (basic notions, characteristical properties) and their specification techniques (models of computation, hierarchical automata, data flow models, petri nets, imperative approaches). Since CPS frequently perform control tasks, the lab's experiments will base on simple control applications. The experiments will use state-of-the-art industrial specification tools (MATLAB/Simulink, LabVIEW, NXC) in order to model cyber-physical models that interact with the environment via sensors and actors.  After successful attendance of the lab, students are able to develop simple CPS. They understand the interdependencies between a CPS and its surrounding processes which stem from the fact that a CPS interacts with the environment via sensors, A/D converters, |
| ·                                 | digital processors, D/A converters and actors. The lab enables students to compare modelling approaches, to evaluate their advantages and limitations, and to decide which technique to use for a concrete task. They will be able to apply these techniques to practical problems. They obtain first experiences in hardware-related software development, in industry-relevant specification tools and in the area of simple control applications.  Students are able to solve similar problems alone or in a group and to present the results accordingly.  Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.   |

| Recommended Previous        | Mathematics 1-3  |                                     |                       |                       |
| Knowledge                   | The modul is an introduction to the theory of signals and syste  | ms. Good knowledge in maths as      | covered by the        | module Mathematik     |
|                             | 1-3 is expected. Further experience with spectral transformat  |                                     |                       |                       |
|                             | but not required.  | ions (Fourier series, Fourier trans | зіотті, саріасе       | transform) is ascial  |
|                             | but not required.  |                                     |                       |                       |
| Educational Objectives      | After taking part successfully, students have reached the follow   | ving learning results               |                       |                       |
| Professional Competence     |  |                                     |                       |                       |
| Knowledge                   | The students are able to classify and describe signals and line  | ar time-invariant (LTI) systems u   | sing methods o        | f signal and system   |
|                             | theory. They are able to apply the fundamental transformatio   | ns of continuous-time and discre    | te-time signals       | and systems. They     |
|                             | can describe and analyse deterministic signals and systems   | •                                   | 9                     |                       |
|                             | understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a   |                                     |                       |                       |
|                             | discrete-time signal.  |                                     |                       |                       |
|                             | The students are familiar with the contents of lecture and tutor   | rials. They can explain and apply   | them to new pr        | oblems.               |
|                             |  |                                     |                       |                       |
| Skills                      | The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and  |                                     |                       |                       |
|                             | system theory. They can analyse and design basic systems regarding important properties such as magnitude and phase  |                                     |                       |                       |
| D                           | response, stability, linearity etc They can assess the impact o  | f LTI systems on the signal prope   | rties in time an      | d frequency domain.   |
| Personal Competence         | The students can is inthe solve an aidis much land   |                                     |                       |                       |
| Autonomy                    | The students can jointly solve specific problems.  | a annuantista litaratura accurac    | They see se           | untual thair lavel of |
| Autonomy                    | The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system. |                                     | ontroi their level of |                       |

| Assignment for the             | Computer Science: Specialisation III. Subject Specific F | ocus: Elective Compulsory      |        |    |  |
| Following Curricula            |  |                                |        |    |  |

## **Thesis**

| Module M-001: Bachelor Thesis         |   |  |  |  |
|---------------------------------------|---|--|--|--|
| Courses                               |   |  |  |  |
| Title                                 | Typ Hrs/wk CP   |  |  |  |
| Module Responsible                    | Professoren der TUHH  |  |  |  |
| Admission Requirements                | According to General Regulations §21 (1):   |  |  |  |
|                                       | At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.   |  |  |  |
| Recommended Previous<br>Knowledge     |   |  |  |  |
| Educational Objectives                | s After taking part successfully, students have reached the following learning results  |  |  |  |
| Professional Competence               |   |  |  |  |
| Knowledge                             | <ul> <li>The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their coun of study (facts, theories, and methods).</li> </ul>  |  |  |  |
|                                       | <ul> <li>On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issu opening up and establishing links with extended specialized expertise.</li> <li>The students are able to outline the state of research on a selected issue in their subject area.</li> </ul>  |  |  |  |
| CL III                                |   |  |  |  |
| Skills                                | <ul> <li>The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to<br/>subject-related problems.</li> </ul>  |  |  |  |
|                                       | <ul> <li>With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.</li> <li>The students can take up a critical position on the findings of their own research work from a specialized perspective.</li> </ul>  |  |  |  |
| Personal Competence Social Competence |   |  |  |  |
| Autonomy                              | <ul> <li>The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within specified time frame.</li> <li>The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.</li> <li>The students can apply the essential techniques of scientific work to research of their own.</li> </ul> |  |  |  |
| Workload in Hours                     | Independent Study Time 360, Study Time in Lecture 0   |  |  |  |
| Credit points                         |   |  |  |  |
| Course achievement                    | None  |  |  |  |
| Examination                           | Thesis  |  |  |  |
| Examination duration and scale        | According to General Regulations  |  |  |  |
| Assignment for the                    | General Engineering Science (German program): Thesis: Compulsory  |  |  |  |
| Following Curricula                   | General Engineering Science (German program, 7 semester): Thesis: Compulsory  |  |  |  |
|                                       | Civil- and Environmental Engineering: Thesis: Compulsory  |  |  |  |
|                                       | Bioprocess Engineering: Thesis: Compulsory  |  |  |  |
|                                       | Chemical and Bioprocess Engineering: Thesis: Compulsory   |  |  |  |
|                                       | Computer Science: Thesis: Compulsory  Data Science: Thesis: Compulsory  |  |  |  |
|                                       | Digital Mechanical Engineering: Thesis: Compulsory  |  |  |  |
|                                       | Electrical Engineering: Thesis: Compulsory  |  |  |  |
