Specialization Computer and Software Engineering	10	
Module M0753: Software Verification	10	
Module M1270: Technical Complementary Course I for CSMS (according to Subject Specific Regulations)	12	
Module M0667: Algorithmic Algebra	13	
Module M0836: Communication Networks	16	
Module M0926: Distributed Algorithms	19	
Module M0586: Efficient Algorithms	21	
Module M1318: Wireless Sensor Networks Module M1271: Technical Complementary Course II for CSMS (according to Subject Specific Regulations)	23 25	
Module M1271: recritical Complementary Course in for CSMS (according to Subject Specific Regulations) Module M0556: Computer Graphics	25 26	
Module M0330: Simulation of Communication Networks	28	
Module M1248: Compilers for Embedded Systems	30	
Module M0924: Software for Embedded Systems	33	
Module M1301: Software Testing	35	
Module M0711: Numerical Mathematics II	37	
Module M1397: Model Checking - Proof Engines and Algorithms	39	
Module M1405: Randomised Algorithms and Random Graphs	42	
Module M0758: Application Security	44	
Module M1400: Design of Dependable Systems	46	
Module M1337: Curves, Cryptosystems and Quantum Computing	48	
Module M0942: Software Security	49	
Module M0910: Advanced System-on-Chip Design (Lab)	51	
Module M0549: Scientific Computing and Accuracy	53	
Module M1395: Real-Time Systems	55	
Module M0733: Software Analysis	57	
Module M0839: Traffic Engineering	59	
Specialization Intelligence Engineering	62	
Module M1270: Technical Complementary Course I for CSMS (according to Subject Specific Regulations)	62	
Module M0550: Digital Image Analysis	63	
Module M0677: Digital Signal Processing and Digital Filters	65	
Module M0563: Robotics	69	
Module M0633: Industrial Process Automation Module M0549: Scientific Computing and Accuracy	71	
Module M0549: Scientific Computing and Accuracy Module M0623: Intelligent Systems in Medicine	73 75	
Module M0823. Intelligent Systems in Medicine Module M0846: Control Systems Theory and Design	75	
Module M0646. Control Systems Theory and Design Module M0676: Digital Communications	82	
Module M0881: Mathematical Image Processing	85	
Module M1336: Soft Computing - Introduction to Machine Learning	87	
Module M0629: Intelligent Autonomous Agents and Cognitive Robotics	89	
Module M1271: Technical Complementary Course II for CSMS (according to Subject Specific Regulations)	93	
Module M1302: Applied Humanoid Robotics	94	į.
Module M0551: Pattern Recognition and Data Compression	96	ĺ.
Module M0630: Robotics and Navigation in Medicine	98	
Module M1310: Discrete Differential Geometry	101	
Module M0673: Information Theory and Coding	103	
Module M0840: Optimal and Robust Control	106	
Module M0711: Numerical Mathematics II	109	
Module M0627: Machine Learning and Data Mining	111	
Module M0832: Advanced Topics in Control	113	
Module M1249: Numerical Methods for Medical Imaging	116	
Module M0738: Digital Audio Signal Processing	118	
Module M0552: 3D Computer Vision	121	
Module M1552: Mathematics of Neural Networks	123	
	125	
Module M-002: Master Thesis	125	í.

Program description

Content

Core qualification

Module M0523: B	Susiness & Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous Knowledge	None
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Skills	 Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.
Personal Competence	
Social Competence	 Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	 Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	
Admission Requirements	
Recommended Previous Knowledge	None
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional	
Competence	
	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studi require but are not able to cover fully. Self-reliance, self-management, collaboration a professional and personnel management competences. The department implements the training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting specific competences and a competence level at the Bachelor's or Master's level. T teaching offerings are pooled in two different catalogues for nontechnical complementa courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offeri ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regare the individual development of competences. It also provides orientation knowledge in the for of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program need be, it can be studied in one to two semesters. In view of the adaptation problems the individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is obligation to study these subjects in one or two specific semesters during the course studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other acro semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learni in courses are part of the learning architecture and are deliberately encouraged in spec courses.
	Fields of Teaching
Knowledge	are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, communication studies, migration studies and sustainability researce and from engineering didactics. In addition, from the winter semester 2014/15 students on Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. He the focus is on encouraging goal-oriented communication skills, e.g. the skills required outgoing engineers in international and intercultural situations.
	The Competence Level

[5]

	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
	Professional Competence (Skills)
	In selected sub-areas students can
Skills	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.
Personal Competence	Personal Competences (Social Skills)
	Students will be able
Social Competence	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
	Personal Competences (Self-reliance) Students are able in selected areas
	 to reflect on their own profession and professionalism in the context of real-life fields of

Autonomy	 application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Specialization Computer and Software Engineering

Module M0753: S	oftware Verification			
Courses				
Title		Тур	Hrs/wk	СР
Software Verification (L062 Software Verification (L063		Lecture Recitation Section (small)	2	3 3
Module Responsible			_	0
Admission Requirements	None			
Recommended Previous Knowledge	 Automata theory and formal la Computational logic Object-oriented programming Functional programming or pr Concurrency 	, algorithms, and data structures		
Educational Objectives	After taking part successfully, student	s have reached the following lea	rning resu	lts
Professional Competence				
Knowledge	Students apply the major verification techniques in model checking and deductive verification. They explain in formal terms syntax and semantics of the underlying logics, and assess the expressivity of different logics as well as their limitations. They classify formal properties of software systems. They find flaws in formal arguments, arising from modeling artifacts or underspecification.			
Skills	Students formulate provable properties of a software system in a formal language. They develop logic-based models that properly abstract from the software under verification and, where necessary, adapt model or property. They construct proofs and property checks by hand or using tools for model checking or deductive verification, and reflect on the scope of the results. Presented with a verification problem in natural language, they select the appropriate verification technique and justify their choice.			
Personal Competence				
	Students discuss relevant topics communicate in English.	in class. They defend their	solutions	orally. They
	Using accompanying on-line material for self study, students can assess their level of knowledge continuously and adjust it appropriately. Working on exercise problems, they receive additional feedback. Within limits, they can set their own learning goals. Upon successful completion, students can identify and precisely formulate new problems in academic or applied research in the field of software verification. Within this field, they can conduct independent studies to acquire the necessary competencies and compile their findings in academic reports. They can devise plans to arrive at new solutions or assess existing ones.			
Workload in Hours	ndependent Study Time 124, Study T	Time in Lecture 56

Module Responsible			_	0		
Admission Requirements	None					
Recommended Previous Knowledge	Programming in Matlab and/or C Basic knowledge in discrete mathema	atics				
Educational Objectives	After taking part successfully, students have reach	ned the following lear	rning resul	ts		
Professional Competence						
Knowledge	The students are able to explain the basic theory and methods of network algorithms and in particular their data structures. They are able to analyze the computational behavior and computing time of linear programming algorithms as well network algorithms. Moreover the students can distinguish between efficiently solvable and NP-hard problems.					
Skills	The students are able to analyze complex tasks and can determine possibilities to transform them into networking algorithms. In particula they can efficiently implement basic algorithms and data structures of LP- and network algorithms and identify possible weaknesses. They are able to distinguish between different efficient data structures and are able to use them appropriately.					
Personal Competence						
Social Competence	The students have the skills to solve problems together in small groups					
Autonomy	The students are able to retrieve necessary informations from the given literature and to combine them with the topics of the lecture. Throughout the lecture they can check their abilities and knowledge on the basis of given exercises and test questions providing an aid to optimize their learning process.

Тур	Project-/problem-based Learning
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Bernd-Christian Renner
Language	EN
Cycle	SoSe
Content	 The PrBL course part will be performed in small groups of students. Topics are from the field of wireless sensor networks and are loosely related to the lecture contents. Project descriptions and goals are provided but have to be solved by the students as follow: Group meeting, creation of working plan and milestones kick-off presentation (during lecture) free working poster creation and presentation Throughout the semester, there will be meetings with the supervisor on a regular basis (weekly or biweekly). Details about the topics and course organization will be provided in the first lecture. Please note that the number of participants is limited due to the available capacity (rooms, equipment, supervisors).
Literature	Will be provided individually

Module M1271: Technical Complementary Course II for CSMS (according to Subject Specific Regulations)

TUHH

Courses					
Title	Typ Hrs/wk CP				
-	Prof. Karl-Heinz Zimmermann				
Admission Requirements					
Recommended Previous Knowledge	None				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	Die Studierenden können die wesentlichen Inhalte des technischen Faches im Rahmen eines Vortrages oder einer Diskussion wiedergeben.				
Skills	The students acquire professional competence in a technical subject available at TUHH.				
Personal Competence					
Social Competence					
Autonomy

Workload in Hours	Independent Study Time 62, Study Time in Lecture 28	
Lecturer	Prof. Tobias Knopp	
Language	EN	
Cycle	SoSe	
Content	Computer graphics and animation are leading to an unprecedented visual revolution. The course deals with its technological foundations: Object-oriented Computer Graphics Projections and Transformations Polygonal and Parametric Modelling Illuminating, Shading, Rendering Computer Animation Techniques Kinematics and Dynamics Effects Students will be be working on a series of mini-projects which will eventually evolve into a final project. Learning computer graphics and animation resembles learning a musical instrument. Therefore, doing your projects well and in time is essential for performing well on this course.

Admission Requirements	None				
Recommended Previous Knowledge	Knowledge of computerBasic programming skill		cation networks		
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	Students are able to explain the necessary stochastics, the discrete event simulation technology and modelling of networks for performance evaluation.				
Skills	Students are able to apply the method of simulation for performance evaluation to different, also not practiced, problems of communication networks. The students can analyse the obtained results and explain the effects observed in the network. They are able to question their own results.				
Personal Competence					
Social Competence	Students are able to acquire e solution approaches and resu small teams.				
Autonomy	Students are able to transfer independently and in discussion with others the acquired method and expert knowledge to new problems. They can identify missing knowledge and acquire this knowledge independently.

Hrs/wk	5
СР	6
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70
Lecturer	Prof. Andreas Timm-Giel
Language	EN
Cycle	SoSe
Content	In the course necessary basic stochastics and the discrete event simulation are introduced. Also simulation models for communication networks, for example, traffic models, mobility models and radio channel models are presented in the lecture. Students work with a simulation tool, where they can directly try out the acquired skills, algorithms and models. At the end of the course increasingly complex networks and protocols are considered and their performance is determined by simulation.
Literature	 Skript des Instituts f ür Kommunikationsnetze Further literature is announced at the beginning of the lecture.

Title Software for Embdedded Software for Embdedded		Typ Lect Reci	ure tation Section (small)	Hrs/wk 2 3	CP 3 3
Module Responsible	Prof. Volker Turau				
Admission Requirements	None				
Recommended Previous Knowledge	 Good knowledge and e Basis knowledge in soft Basic understanding of 	tware engineering			
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	Students know the basic principles and procedures of software engineering for embedded systems. They are able to describe the usage and pros of event based programming using interrupts. They know the components and functions of a concrete microcontroller. The participants explain requirements of real time systems. They know at least three scheduling algorithms for real time operating systems including their pros and cons.				
Skills	Students build interrupt-based programs for a concrete microcontroller. They build and use a preemptive scheduler. They use peripheral components (timer, ADC, EEPROM) to realize complex tasks for embedded systems. To interface with external components they utilize serial protocols.

Title Software Testing (L1791)		Typ Lecture Project-/problem-based	Hrs/wk 2	СР 3	
Software Testing (L1792)		Learning	2	3	
Module Responsible					
Admission Requirements	None				
Recommended Previous Knowledge					
Educational Objectives	After faking part successfully students have re	eached the following lea	Irning resul	ts	
Professional Competence					
Knowledge	Students explain the different phases of testing, describe fundamental techniques of different types of testing, and paraphrase the basic principles of the corresponding test process. They give examples of software development scenarios and the corresponding test type and technique. They explain algorithms used for particular testing techniques and describe possible advantages and limitations.				
Skills	Students identify the appropriate testing type and technique for a given problem. They adapt and execute respective algorithms to execute a concrete test technique properly. They interpret testing results and execute corresponding steps for proper re-test scenarios. They write and analyze test specifications. They apply bug finding techniques for non-trivial problems.				
Personal Competence					
Social Competence	Students discuss relevant topics in class. They They communicate in English.	/ defend their solutions	orally.		
Autonomy	Students can assess their level of knowledge continuously and adjust it appropriately, based on feedback and on self-guided studies. Within limits, they can set their own learning goals. Upon successful completion, students can identify and precisely formulate new problems in academic or applied research in the field of software testing. Within this field, they can conduct independent studies to acquire the necessary competencies and compile their findings in academic reports. They can devise plans to arrive at new solutions or assess existing ones

Cycle	SoSe Correctness is a major concern in embedded systems. Model checking can fully automatically
	proof formal properties about digital hardware or software. Such properties are given in temporal logic, e.g., to prove "No two orthogonal traffic lights will ever be green."
	And how do the underlying reasoning algorithms work so effectively in practice despite a computational complexity of NP hardness and beyond?
	But what are the limitations of model checking? How are the models generated from a given design?
	The lecture will answer these questions. Open source tools will be used to gather a practical
	experience.
	Among other topics, the lecture will consider the following topics:
	 Modelling digital Hardware, Software, and Cyber Physical Systems
	Data structures, decision procedures and proof engines
	 Binary Decision Diagrams
	 And-Inverter-Graphs
Content	 Boolean Satisfiability
	 Satisfiability Modulo Theories
	Specification Languages

Description The term dependability comprises various aspects of a system. These are typically: • Reliability • Availability • Maintainability • Safety • Security This makes dependability a core aspect that has to be considered early in system matter whether software, embedded systems or full scale cyber-physical sy considered. Contents The module introduces the basic concepts for the design and the analysis of c systems. Design examples for getting practical hands-on-experience in dependa techniques. The module focuses towards embedded systems. The following covered: • Modelling • Fault Tolerance • Design Concepts • Analysis Techniques

Educationa Objectives	I ATTOR TOKING DOTT CHOOSETHINV STUDOR	After taking part successfully, students have reached the following learning results		
Professiona Competence				
Knowledge	The students understand the basic theory of elliptic curves, classical cryptosysteme, bas methods of cryptanalysis, cryptography of elliptic curves, quantum computing and the pos quantum computing scenario, algebraic codes over curves, and the famous theorem of Riemann-Roch.			
Skills	The students are in the position to apply the group law of elliptic curves, to find out if a curve non-singular, to sketch cryptographic algorithms that make use of elliptic curves, to speci- quantum algorithms, and to determine the parameters of algebraic codes defined over curves.			
Persona Competence				
Social Competence	Students are able to solve specific problems alone or in a group and to present the result accordingly.			
Autonom	Students are able to acquire new knowledge from specific standard books and to associate the acquired knowledge to other classes.

Professional				
Competence		n ovnorionos on odvorce	d opposit	of comput
	This module provides in-depth, hands-on experience on advanced concepts of computer architecture. Using the Hardware Description Language VHDL and using reconfigurabl FPGA hardware boards, students learn how to design complex computer systems (so-calle systems-on-chip, SoCs), that are commonly found in the domain of embedded systems, i actual hardware.			
Knowledge	Starting with a simple processor architecture, the students learn to how realize instruction processing of a computer processor according to the principle of pipelining. They implement different styles of cache-based memory hierarchies, examine strategies for dynam scheduling of machine instructions and for branch prediction, and finally construct a complet MPSoC system (multi-processor system-on-chip) that consists of multiple processor cores that are connected via a shared bus.			
Skills	Students will be able to analyze, how highly specific and individual computer systems can be constructed using a library of given standard components. They evaluate the interferences between the physical structure of a computer system and the software executed thereon. This way, they will be enabled to estimate the effects of design decision at the hardware level or the performance of the entire system, to evaluate the whole and complex system and to propose design options to improve a system.

Admission				
Requirements	None			
Recommended Previous Knowledge	Computer Engineering, Basic knowl	ledge in embedded systems		
Educational Objectives	After taking part successfully, studer	nts have reached the following lea	arning resu	lts
Professional Competence				
Knowledge	Real-Time applications are an important class of embedded systems such as drive assistance systems in modern automobiles, medical devices, process plants and aircrafts. Their main feature is that they are required to complete work and deliver services on a timely basis. This course aims at introducing fundamental theories and concepts about real-time systems. As an introduction, the lecture describes several classes of real-time applications (e.g. digital controllers, signal processing, real-time databases and multimedia). It introduces the main characteristics of real-time systems and explains the relationship between timing requirements and functional requirements. Next, this is followed by a reference model used to characterize the main features of real-time applications. Several scheduling approaches (e.g. clock-driven and priority-driven) and timing analysis techniques used for the verification and validation of the timing properties of real-time systems are introduced and discussed. The last part of the course will focus on the timing behavior of communications networks taking into account properties such as the end-to-end latency and the delay jitter, and or shared resources access control and synchronization in multiprocessor/multicore			
Skills	Students have solid notions about the basic properties of common real-time systems and t methods used to analyze them. Students are able to characterize and model the timi features of a real-time system. They use schedulability analysis techniques to compute t response time of systems and check if this meets the timing requirements (I.e deadline) of t system.

Software Analysis (L0631 Software Analysis (L0632		Lecture Recitation Section (small)	2 2	3 3
Module Responsible		()		-
Admission Requirements				
Recommended Previous Knowledge	 Basic knowledge of software-enginee Discrete algebraic structures Object-oriented programming, algorith Functional programming or Procedura 	nms, and data structures		
Educational Objectives	After taking part successfully, students have re	eached the following lea	rning resu	lts
Professional Competence				
Knowledge	Students apply the major approaches to data-flow analysis, control-flow analysis, and type- based analysis, along with their classification schemes, and employ abstract interpretation. They explain the standard forms of internal representations and models, including their mathematical structure and properties, and evaluate their suitability for a particular analysis. They explain and categorize the major analysis algorithms. They distinguish precise solutions from approximative approaches, and show termination and soundness properties.			
Skills	Presented with an analytical task for a software artifact, students select appropriate approaches from software analysis, and justify their choice. They design suitable representations by modifying standard representations. They develop customized analyses and devise them as safe overapproximations. They formulate analyses in a formal way and construct arguments for their correctness, behavior, and precision.			
Personal Competence				
Social Competence	Students discuss relevant topics in class. They defend their solutions orally. The communicate in English.			
Autonomy	Using accompanying on-line material for self study, students can assess their level of knowledge continuously and adjust it appropriately. Working on exercise problems, they receive additional feedback. Within limits, they can set their own learning goals. Upon successful completion, students can identify and precisely formulate new problems in academic or applied research in the field of software analysis. Within this field, they can conduct independent studies to acquire the necessary competencies and compile their findings in academic reports. They can devise plans to arrive at new solutions or assess existing ones.

Educational Objectives	After taking part successfully, stude	ents have reached the following le	arning resu	ts
Professional Competence				
Knowledge	The students know and understand basic algorithms of digital signal processing. They are familiar with the spectral transforms of discrete-time signals and are able to describe and analyse signals and systems in time and image domain. They know basic structures of digital filters and can identify and assess important properties including stability. They are aware of the effects caused by quantization of filter coefficients and signals. They are familiar with the basics of adaptive filters. They can perform traditional and parametric methods of spectrum estimation, also taking a limited observation window into account.			
Skills	The students are able to apply methods of digital signal processing to new problems. The can choose and parameterize suitable filter striuctures. In particular, the can design adaptive filters according to the minimum mean squared error (MMSE) criterion and develop at efficient implementation, e.g. based on the LMS or RLS algorithm. Furthermore, the student are able to apply methods of spectrum estimation and to take the effects of a limited observation window into account.			
Personal Competence				
Social Competence	The students can jointly solve spec	ific problems.		
Autonomv	The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.

	Prof. Alexander Schlaefer				
Admission Requirements	None				
Recommended Previous Knowledge	Invincinles of classiftems and data structures				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	The students can evaluate and assess discrete event systems. They can evaluate propertie of processes and explain methods for process analysis. The students can compare method for process modelling and select an appropriate method for actual problems. They ca discuss scheduling methods in the context of actual problems and give a detailed explanatio of advantages and disadvantages of different programming methods. The students can relat process automation to methods from robotics and sensor systems as well as to recent topic like 'cyberphysical systems' and 'industry 4.0'.				
Skills	The students are able to involves taking into acco implementation using PL0	unt optimal sched	-		
Personal Competence		as to solve problem	5		
Social Competence					
Autonomy	The students can reflect their knowledge and document the results of their work.

Module M0549: Scientific Computing and Accuracy Courses Title Hrs/wk CP Typ Verification Methods (L0122) Lecture 3 Verification Methods (L1208) Recitation Section (small) 2 3 Module Responsible Prof. Siegfried Rump Admission None Requirements Recommended Basic knowledge in numerics **Previous Knowledge** Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence The students have deeper knowledge of numerical and semi-numerical methods with the goal to compute principally exact and accurate error Knowledge bounds. For several fundamental problems they know algorithms with the verification of the correctness of the computed result. The students can devise algorithms for several basic problems which compute rigorous error bounds for the solution and analyze the Skills sensitivity with respect to variation of the input data as well. Personal Competence The students have the skills to solve problems together in small groups *Social Competence* and to present the achieved results in an appropriate manner. The students are able to retrieve necessary informations from the given literature and to combine them with the topics of the lecture. Throughout the lecture they can check their abilities and knowledge on the basis of Autonomy given exercises and test questions providing an aid to optimize their learning process. Educational Objectives	Attor taking	part success	fully, students have re	eached the following lea	rning resu	lts
Professional Competence						
Knowledge	The students are able to analyze and solve clinical treatment planning and decision support problems using methods for search, optimization, and planning. They are able to explain methods for classification and their respective advantages and disadvantages in clinical contexts. The students can compare different methods for representing medical knowledge. They can evaluate methods in the context of clinical data and explain challenges due to the clinical nature of the data and its acquisition and due to privacy and safety requirements.					
Skills	The students can give reasons for selecting and adapting methods for classification, regression, and prediction. They can assess the methods based on actual patient data and evaluate the implemented methods.					
Personal Competence						
Social Competence		The students discuss the results of other groups, provide helpful feedback and can incoorporate feedback into their work.				
Autonomy		The students can reflect their knowledge and document the results of their work. They can present the results in an appropriate manner.

Digital Communications (L	.0444)	Lecture	2	3
Digital Communications (L	.0445)	Recitation Section (large)	1	2
Laboratory Digital Commu	nications (L0646)	Practical Course	1	1
Module Responsible	Prof. Gerhard Bauch			
Admission Requirements	None			
Recommended Previous Knowledge	 Mathematics 1-3 Signals and Systems Fundamentals of Communications and Random Processes 			
Educational Objectives	After taking part successfully, students have	e reached the following lea	rning resu	lts
Professional				
Competence				
Knowledge	The students are able to understand, compare and design modern digital information transmission schemes. They are familiar with the properties of linear and non-linear digital modulation methods. They can describe distortions caused by transmission channels and design and evaluate detectors including channel estimation and equalization. They know the principles of single carrier transmission and multi-carrier transmission as well as the fundamentals of basic multiple access schemes.			
Skills	The students are able to design and analyse a digital information transmission schem including multiple access. They are able to choose a digital modulation scheme taking int account transmission rate, required bandwidth, error probability, and further signal properties. They can design an appropriate detector including channel estimation and equalization takin into account performance and complexity properties of suboptimum solutions. They are abl to set parameters of a single carrier or multi carrier transmission scheme and trade th properties of both approaches against each other.			
Personal Competence				
Social Competence	The students can jointly solve specific prob	blems.		
Autonomy	The students are able to acquire relevant information from appropriate literature sources. The can control their level of knowledge during the lecture period by solving tutorial problems software tools, clicker system.

Content	These lectures deal with geometric aspects of differential equations and with their treatment on the computer. The prerequisites from linear algebra and analysis are reviewed at the beginning. Applications are to curved surfaces, to classical mechanics and mechatronics, to various field equations, to computer graphics and to transferring mathematical constructions to data types, compiler functions, programming languages, and special hardware. Keywords: Basics from linear algebra, tensors, exterior algebra, Clifford algebras, tuple types Basics of coordinate-free analysis, vector fields and differential forms, integration, discrete exterior calculus Local differential geometry: connections, symplectic geometry, Riemannian geometry, discrete mechanics and connections Global differential geometry: manifolds, Lie groups, fibre bundles, Fourier decompositions, random processes, space and time

Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	The students know the basic definitions for quantification of information in the sense information theory. They know Shannon's source coding theorem and channel codin theorem and are able to determine theoretical limits of data compression and error-free da transmission over noisy channels. They understand the principles of source coding as well a error-detecting and error-correcting channel coding. They are familiar with the principles decoding, in particular with modern methods of iterative decoding. They know fundament coding schemes, their properties and decoding algorithms.				
Skills	The students are able to determine the limits of data compression as well as of da transmission through noisy channels and based on those limits to design basic parameters a transmission scheme. They can estimate the parameters of an error-detecting or error correcting channel coding scheme for achieving certain performance targets. They are able compare the properties of basic channel coding and decoding schemes regarding error correction capabilities, decoding delay, decoding complexity and to decide for a suitab method. They are capable of implementing basic coding and decoding schemes in software.

Knowledge	 Students can explain the significance of the matrix Riccati equation for the solution LQ problems. They can explain the duality between optimal state feedback and optimal state estimation. They can explain how the H2 and H-infinity norms are used to represent stability a performance constraints. They can explain how an LQG design problem can be formulated as special case an H2 design problem. They can explain how model uncertainty can be represented in a way that lends its to robust controller design They can explain how - based on the small gain theorem - a robust controller controller controller design and synthesis conditions on feedback loops can represented as linear matrix inequalities. 					
Skills	 Students are capable of designing and tuning LQG controllers for multivariable pl models. They are capable of representing a H2 or H-infinity design problem in the form of generalized plant, and of using standard software tools for solving it. They are capable of translating time and frequency domain specifications for con loops into constraints on closed-loop sensitivity functions, and of carrying out a mixe sensitivity design. They are capable of constructing an LFT uncertainty model for an uncertain system and of designing a mixed-objective robust controller. They are capable of formulating analysis and synthesis conditions as linear ma inequalities (LMI), and of using standard LMI-solvers for solving them. They can carry out all of the above using standard software tools (Matlab robust con toolbox). 					
Personal Competence						
Social Competence		-	ps on specific problems to arri	-

Knowledge	Students can explain the difference between instance-based and model-based learning approaches, and they can enumerate basic machine learning technique for each of the two basic approaches, either on the basis of static data, or on the basis of incrementally incomine data . For dealing with uncertainty, students can describe suitable representation formalisms and they explain how axioms, features, parameters, or structures used in these formalism can be learned automatically with different algorithms. Students are also able to sketch different clustering techniques. They depict how the performance of learned classifiers can be improved by ensemble learning, and they can summarize how this influences computational learning theory. Algorithms for reinforcement learning can also be explained by students.			
	Student derive decision trees and, tables and are able to name and apply the basic idea of first-order i EM algorithms for learning paran algorithms. They also know how to kNN classifiers, neural networks, application areas and algorithm techniques and explain the basic c machine learning techniques, e.g. They can distinguish various enser of those techniques.	explain basic optimization nductive leaning. Students neters of Bayesian netwo o carry out Gaussian mixt and support vector ma ic properties. Students omponents of those techni , k-means clustering and	n techniques. Educational Objectives	After taking part successfully, studen	ts have reached the following lea	rning resu	lts
Professional Competence				
Knowledge	Die Studierenden können die grundlegenden Verfahren und Methoden der digitale Audiosignalverarbeitung erklären. Sie können die wesentlichen physikalischen Effekte b der Sprach- und Audiosignalverarbeitung erläutern und in Kategorien einordnen. Sie könne einen Überblick der numerischen Methoden und messtechnischen Charakterisierung vo Algorithmen zur Audiosignalverarbeitung geben. Sie können die erarbeiteten Algorithmen a weitere Anwendungen im Bereich der Informationstechnik und Informatik abstrahieren.			
Skills	The students will be able to apply methods and techniques from audio signal processing the fields of mobile and internet communication. They can rely on elementary algorithms audio signal processing in form of Matlab code and interactive JAVA applets. They can stud parameter modifications and evaluate the influence on human perception and technic applications in a variety of applications beyond audio signal processing. Students can perfor measurements in time and frequency domain in order to give objective and subjective quali measures with respect to the methods and applications.			
Personal Competence	The students can work in small gr	roups to study special tasks an	d problem	s and will
Social Competence	enforced to present their results with			
Autonomy	The students will be able to retrieve putt hem into the context of the lectu them to other lectures (signals and s processing, and pattern recognition) problems and effects in the field audi	ure. They can relate their gathere systems, digital communication sy). They will be prepared to under	ed knowled vstems, ima	lge and rela age and vid
Workload in Hours	Independent Study Time 124, Study	Time in Lecture 56		
Credit points	6			
Course achievement	None			
Examination	Written exam			
Examination duration and scale	45 min			
	Computer Science: Specialisation In Electrical Engineering: Specialisati Compulsory Computational Science and Engine Elective Compulsory	ion Information and Communic ering: Specialisation Systems En	ation Syst	ems: Electi and Robotic
A a a lan mant for the	Information and Communication Sys	toms: Specialisation Secure and	Denendah	In IT System

Information and Communication Systems: Specialisation Communication Systems, Focus
Signal Processing: Elective Compulsory
Microelectronics and Microsystems: Specialisation Communication and Signal Processing:
Elective Compulsory

Course L0650: Digital Audio Signal Processing			
Тур	Lecture		
Hrs/wk			
СР	4		
Workload in Hours	Independent Study Time 78, Study Time in Lecture 42		
Lecturer	Prof. Udo Zölzer		
Language			
Cycle	WiSe		
Content	 Introduction (Studio Technology, Digital Transmission Systems, Storage Media, Audio Components at Home) Quantization (Signal Quantization, Dither, Noise Shaping, Number Representation) AD/DA Conversion (Methods, AD Converters, DA Converters, Audio Processing Systems, Digital Signal Processors, Digital Audio Interfaces, Single-Processor Systems, Multiprocessor Systems) Equalizers (Recursive Audio Filters, Nonrecursive Audio Filters, Multi-Complementary Filter Bank) Room Simulation (Early Reflections, Subsequent Reverberation, Approximation of Room Impulse Responses) Dynamic Range Control (Static Curve, Dynamic Behavior, Implementation, Realization Aspects) Sampling Rate Conversion (Synchronous Conversion, Asynchronous Conversion, Interpolation Methods) Data Compression (Lossless Data Compression, Lossy Data Compression, Psychoacoustics, ISO-MPEG1 Audio Coding) 		
 U. Zölzer, Digitale Audiosignalverarbeitung, 3. Aufl., B.G. Teubner, 2005. U. Zölzer, Digitale Audio Signal Processing, 2nd Edition, J. Wiley & Sons, 2005. U. Zölzer (Ed), Digital Audio Effects, 2nd Edition, J. Wiley & Sons, 2011. 			

Course L0651: Digital Audio Signal Processing	
Тур	Recitation Section (large)

Recommended Previous Knowledge			
Educational Objectives	After taking part successfully, students have reached the fol	llowing learning resul	ts
Professional Competence			
Knowledge	 The students can use specialized knowledge (fac subject competently on specialized issues. The students can explain in depth the relevant app or more areas of their subject, describing current de position on them. The students can place a research task in their subjand critically assess the state of research. 	proaches and terminc evelopments and takir	blogies in or ng up a critic
Skills	 The students are able: To select, apply and, if necessary, develop further m the specialized problem in question. To apply knowledge they have acquired and metho their studies to complex and/or incompletely define way. To develop new scientific findings in their subject assessment. 	ods they have learnt in ed problems in a sol	the course ution-oriente
Personal Competence			
Social Competence	 Students can Both in writing and orally outline a scientific issue understandably and in a structured way. Deal with issues competently in an expert discuss that is appropriate to the addressees while upho viewpoints convincingly. 	ion and answer them	ı in a mann
Autonomy	 Students are able: To structure a project of their own in work packages To work their way in depth into a largely unkninformation required for them to do so. 		

	• To apply the techniques of scientific work comprehensively in research of their own.
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
