Program description	3
Core Qualification	5
Module M0577: Non-technical Courses for Bachelors	5
Module M0642: Physics for Engineers	7
Module M0743: Electrical Engineering I: Direct Current Networks and Electromagnetic Fields	9
Module M0829: Foundations of Management	10
Module M0850: Mathematics I	13
Module M1692: Computer Science for Engineers - Introduction and Overview	16
Module M0547: Electrical Engineering II: Alternating Current Networks and Basic Devices	17
Module M0748: Materials in Electrical Engineering	20
Module M0851: Mathematics II	24
Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication	27
Module M0783: Measurements: Methods and Data Processing	29
Module M0708: Electrical Engineering III: Circuit Theory and Transients	31
Module M0730: Computer Engineering	33
Module M0853: Mathematics III	35
Module M0567: Theoretical Electrical Engineering I: Time-Independent Fields	38
Module M0610: Electrical Machines and Actuators	40
Module M0672: Signals and Systems	42
Module M0734: Electrical Engineering Project Laboratory	45
Module M0854: Mathematics IV	46
Module M1340: Introduction to Waveguides, Antennas, and Electromagnetic Compatibility	49
Module M0834: Computernetworks and Internet Security	51
Module M0568: Theoretical Electrical Engineering II: Time-Dependent Fields	53
Module M1235: Electrical Power Systems I: Introduction to Electrical Power Systems	55
Module M0662: Numerical Mathematics I	58
Module M0675: Introduction to Communications and Random Processes	60
Module M1802: Engineering Mechanics I (Stereostatics)	64
Module M0760: Electronic Devices	66
Module M0833: Introduction to Control Systems	68
Module M1242: Quantum Mechanics for Engineers	70
Module M0634: Introduction into Medical Technology and Systems	. 72
Module M1803: Engineering Mechanics II (Elastostatics)	74
Module M0777: Semiconductor Circuit Design	76
Module M0803: Embedded Systems	78
Thesis	80
Module M-001: Bachelor Thesis	80

Program description

Content

The electrical industry is the second largest industrial sector in Germany after mechanical engineering in terms of the number of employees. With approx. 847,000 employees, a turnover of approx. 179 billion euros is achieved (based on the year 2016, source: de.statista.com). Electrical engineering is thus not only one of the "classical engineering sciences" but also one of the main drivers of national and international technical progress in recent decades.

In engineering terms, electrical engineering deals with research, development and, in general, the application of electrical signals, electrical energy and electromagnetic fields in corresponding components and circuits.

Due to the widely ramified fields of application, a high degree of specialisation is required in the profession. As a consequence, the vocational training of electrical engineers is in the area of tension between the breadth of the training (for the widest possible range of later uses) and the depth of the training (for current, subject-specific competences). Within the framework of the consecutive Bachelor's/Master's degree programmes in electrical engineering at the TUHH, the breadth of the subject is taught primarily during the Bachelor's degree programme and focal points are deepened in the Master's degree programme. The Bachelor's programme conveys the fundamentals of electrical engineering, information technology, computer science as well as mathematics and physics required for solving electrical engineering and information technology tasks. In addition to the technical canon of fundamentals, training in non-technical areas such as business administration, patents, management, humanities, law and philosophy is aimed for, which meets the modern professional requirements of an engineer.

Career prospects

Successful completion of the Bachelor's degree programme in Electrical Engineering enables an early career entry into the typical fields of activity in electrical engineering, in addition to taking up a Master's degree programme that provides more in-depth scientific knowledge. These include communications engineering, measurement and control engineering, microsystems engineering and nanoelectronics, electrical power engineering, high-frequency engineering and optical systems.

Electrical engineers are among the most sought-after academics on the labour market. A current evaluation of data from the Federal Employment Agency proves the increasing demand (Federal Employment Agency: "Berichte: Blickpunkt Arbeitsmarkt - Ingenieurinnen und Ingenieure", Nuremberg, 2018). While the number of registered unemployed continues to fall steadily, the number of registered vacancies is increasing significantly at the same time. At the same time, only a fraction of the advertised jobs are reported to the Federal Employment Agency, so that the supply of jobs currently exceeds the demand. Thus, as in previous years, the demand for electrical engineers - especially in the old federal states including Hamburg - cannot be met ("shortage of skilled workers").

Learning target

The desired learning outcomes of the degree programme are based on the objectives listed above. The focus is on enabling graduates to responsibly and competently perform an engineering activity in the various fields of activity in electrical engineering. The learning objectives are divided into the following categories: knowledge, skills, social competence and independence.

Knowledge

- Students can name and describe the mathematical-scientific fundamentals and methods of engineering sciences. This includes, in particular, elements of higher analysis and linear algebra as well as physics.
- Students can explain the fundamentals and methods of electrical engineering and information technology and can give an overview of their subject. Of particular importance are direct and alternating current theory, circuit technology, the theory of electromagnetic fields and waves, the materials and components of electrical engineering as well as systems theory with their respective methods.
- The students can explain the basics, methods and areas of application of the sub-disciplines of electrical engineering in detail. Important sub-disciplines are electrical power engineering, communications engineering, circuit technology, measurement technology and control engineering.
- Students can reproduce the fundamentals and methods of economics and can give an overview of the relevant social, ethical, ecological and economic boundary conditions of their subject.

Skills

- The students can independently work on research questions using suitable methods, document their chosen solution path and present it to an expert audience.
- Students can solve problems from the fields of analysis, linear algebra, function theory and the theory of differential equations using the methods they have learned
- The students can assess the current and voltage behaviour in electrical networks, dimension simple circuits and analyse networks in the time and frequency domain. They can use semiconductor components such as transistors and diodes as well as operational amplifiers in their areas of application. They are able to plan electrical power supply systems in basic outlines and analyse the operating behaviour of electrical machines and calculate typical variables. They are able to clarify metrological issues and apply methods for describing and processing measurement data.
- The students can model, programme and adapt simple algorithms. They can design and test software and estimate its complexity. They are able to distinguish between the different levels of abstraction of today's computing systems.
- The students can apply different methods to solve Maxwell's equations for electromagnetic field problems. They can derive typical quantities from the fields and dimension them for application in practice.
- The students can describe and analyse linear, time-invariant systems with the methods of signal and system theory. They are able to design and evaluate simple communication and control systems.
- The students can generally map typical problems to their basic knowledge, find suitable solution methods and implement them. They can appropriately document the chosen solution in writing and present it to an audience in a clearly structured manner.

Social competence

- Students are able to present the procedure and results of their work in a comprehensible manner, both orally and in writing.
- The students are able to communicate about the contents and problems of electrical engineering with experts and laypersons. They can react
 appropriately to guestions, additions and comments.
- The students are able to work in groups. They can define, distribute and integrate subtasks. They can make time arrangements and interact socially.

Competence to work independently

Module Manual B.Sc. "Electrical Engineering"

- The students are able to obtain necessary technical information and place it in the context of their knowledge
 The students can realistically assess their existing competences and work on deficits independently
 The students can learn complex topics and work on problems in a self-organised and self-motivated manner (lifelong learning).

Program structure

 $The \ curriculum \ of \ the \ Bachelor's \ degree \ programme \ in \ Electrical \ Engineering \ is \ structured \ as \ follows:$

- Core qualification compulsory: 24 modules, 144 credit points (LP), 1st 6th semester.
- Core qualification compulsory elective: 4 modules, 24 LP, 4th, 5th and 6th semester
- Bachelor thesis: 12 LP, 6th semester

The total workload for the Bachelor's programme is 180 LP, with a semester distribution of 30/28/32/30/30/30 LP.

In addition to the subject modules, the core qualification also includes the following interdisciplinary modules:

- Fundamentals of business administration: 6 LP, 1st semester
- Non-technical supplementary courses in the Bachelor: 6 LP, 1st 6th semester

Core Qualification

Module M0577: Non-technical Courses for Bachelors Module Responsible Dagmar Richter Admission Requirements None Recommended Previous Knowledge Educational Objectives After taking part successfully, students have reached the following learning results Professional Competence

Knowledge The Non-technical Academic Programms (NTA)

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its **teaching architecture**, in its **teaching and learning arrangements**, in **teaching areas** and by means of teaching offerings in which students can qualify by opting for **specific competences** and a **competence level** at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles"

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-priented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- locate selected specialized areas with the relevant non-technical mother discipline,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation
 in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic methods of the said scientific disciplines,
- auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple questions in aforementioned scientific disciplines in a sucsessful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

Personal Competence

Social Competence	Personal Competences (Social Skills)
	Students will be able
	to learn to collaborate in different manner,
	 to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,
	 to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),
	to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	 to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly
	 to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Content	In the physics lab a number of key experiments on physical phenomena in mechanics, oscillatory and wave motion, thermodynamics, electricity, and optics will be conducted by the students under assistance of a lecturing tutor. The experiments are part of the physics education program presented in the course "Physics for TUHH-ET Engineers". Beyond teaching of fundamental physical background the objectives are basic skills in preparation and performing physical measurements, usage of physical equipment, analysis of the results and preparation of a report on the experimental data.			
Literature	Zu den Versuchen gibt es individuelle Versuchsanleitungen, die vor der Versuchsdurchführung ausgegeben werden. Zum Teil müssen die zur Versuchsdurchführung notwendigen physikalischen Hintergründe selbstständig erarbeitet werden, wozu die zur Vorlesung "Physik für TUHH-ET Ingenieure" angegebene Literatur gut geeignet ist.

Module M0547: Electi	rical Engineering II: Alternating Cu	rrent Networks and Basic	Devices				
Courses							
	g Current Networks and Basic Devices (L0178) g Current Networks and Basic Devices (L0179)	Typ Lecture Recitation Section (smal	Hrs/wk 3 1) 2	CP 5			
Module Responsible	Prof. Christian Becker						
Admission Requirements	None						
Recommended Previous	Electrical Engineering I						
Knowledge	Mathematics I						
	Direct current networks, complex numbers						
Educational Objectives	After taking part successfully, students have reach	ed the following learning results					
Professional Competence							
Knowledge	Students are able to reproduce and explain fund	amental theories, principles, and me	ethods related to the	theory of alternating			
	currents. They can describe networks of linear ele	ments using a complex notation for	voltages and currents	. They can reproduce			
	an overview of applications for the theory of alternating currents in the area of electrical engineering. Students are capable o explaining the behavior of fundamental passive and active devices as well as their impact on simple circuits.						
Skills	Students are capable of calculating parameters within simple electrical networks at alternating currents by means of a complex notation for voltages and currents. They can appraise the fundamental effects that may occur within electrical networks at alternating currents. Students are able to analyze simple circuits such as oscillating circuits, filter, and matching networks quantitatively and dimension elements by means of a design. They can motivate and justify the fundamental elements of an electrical power supply (transformer, transmission line, compensation of reactive power, multiphase system) and are qualified to dimension their main features.						
Personal Competence Social Competence	Students are able to work together on subject relat	ed tasks in small groups. They are al	ole to present their res	sults effectively.			
Autonomy	Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as online-tests and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of other lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).

Knowledge				
Educational Objectives	After taking part successfully, students have re	eached the following learning results		
Professional Competence				
Knowledge	Students can explain the composition and the structural properties of materials used in electrical engineering. Students can explicate the relevance of mechanical, electrical, thermal, dielectric, magnetic and chemical properties of materials in view of their applications in electrical engineering.			
Skills	Students can identify appropriate descriptive models and apply them mathematically. They can derive approximative solutions and judge factors influential on the performance of materials in electrical engineering applications.			
Personal Competence Social Competence		lems in groups. They can present their resul	ts effectively withir	the framework of th
Autonomy	Students are capable to extract relevant information from the provided references and to relate this information to the content of the lecture. They can reflect their acquired level of expertise with the help of lecture accompanying measures such as exam typical exam questions. Students are able to connect their knowledge with that acquired from other lectures.

They are able to distinguish between and to explain the different abstraction layers of today's computing systems – from gates and circuits up to complete processors. After successful completion of the module, the students are able to judge the interdependencies between a physical computer system and the software executed on it. In particular, they shall understand the consequences that the execution of software has on the hardware-centric abstraction layers from the assembly language down to gates. This way, they will be enabled to evaluate the impact that it these low abstraction levels have on an entire system's performance and to propose feasible options. Personal Competence Social Competence Social Competence Students are able to solve similar problems alone or in a group and to present the results accordingly. 	etical Electrical Engineering I: Ti	me-maependent Fields		
Courses				
Title Theoretical Electrical Engineering I: Theoretical Electrical Engineering I:		Typ Lecture Recitation Section (small)	Hrs/wk 3 2	CP 5 1
	Prof. Christian Schuster	,		
Admission Requirements				
	Basic principles of electrical engineering and adv	vanced mathematics		
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence Knowledge	Students can explain the fundamental formulas, relations, and methods of the theory of time-independent electromagnetic fields. They can explicate the principal behavior of electrostatic, magnetostatic, and current density fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-independent electromagnetic fields and are able to explicate these.			
Skills	Students can apply Maxwell's Equations in integral notation in order to solve highly symmetrical, time-independen electromagnetic field problems. Furthermore, they are capable of applying a variety of methods that require solving Maxwell' Equations for more general problems. The students can assess the principal effects of given time-independent sources of fields are analyze these quantitatively. They can deduce meaningful quantities for the characterization of electrostatic, magnetostatic, an electrical flow fields (capacitances, inductances, resistances, etc.) from given fields and dimension them for practical applications			
Personal Competence Social Competence	Students are able to work together on subject reduring exercise sessions).	elated tasks in small groups. They are able	to present their re	sults effectively (e.
Autonomy	Students are capable to gather necessary information from provided references and relate this information to the lecture. They a able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individu learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of oth lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).

Content	- Maxwell's Equations in integral and differential notation
	- Boundary conditions
	- Laws of conservation for energy and charge
	- Classification of electromagnetic field properties
	- Integral characteristics of time-independent fields (R, L, C)
	- Generic approaches to solving Poisson's Equation
	- Electrostatic fields and specific methods of solving
	- Magnetostatic fields and specific methods of solving
	- Fields of electrical current density and specific methods of solving
	- Action of force within time-independent fields
	- Numerical methods for solving time-independent problems
	The practical application of numerical methods will be trained within specifically prepared lectures in an interactive manner using small MATLAB programs.

Module M0672: Signa	Is and Systems		
Courses			
Title Signals and Systems (L0432) Signals and Systems (L0433)	Typ Hrs/wk CP Lecture 3 4 Recitation Section (small) 2 2		
Module Responsible	Prof. Gerhard Bauch		
Admission Requirements	None		
Recommended Previous	Mathematics 1-3		
Knowledge			
	The modul is an introduction to the theory of signals and systems. Good knowledge in maths as covered by the moduls Mathemati 1-3 is expected. Further experience with spectral transformations (Fourier series, Fourier transform, Laplace transform) is useful but not required.		
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge	The students are able to classify and describe signals and linear time-invariant (LTI) systems using methods of signal and system theory. They are able to apply the fundamental transformations of continuous-time and discrete-time signals and systems. They can describe and analyse deterministic signals and systems mathematically in both time and image domain. In particular, they understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a discrete-time signal.		
	The students are familiar with the contents of lecture and tutorials. They can explain and apply them to new problems.		
Skills	The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and system theory. They can analyse and design basic systems regarding important properties such as magnitude and phase response, stability, linearity etc They can assess the impact of LTI systems on the signal properties in time and frequency domain.		
Personal Competence			
Social Competence	The students can jointly solve specific problems.		
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level o		
	knowledge during the lecture period by solving tutorial problems, software tools, clicker system.

Content	Introduction to signal and system theory
	• Signals
	Classification of signals
	■ Continuous-time and discrete-time signals
	 Analog and digital signals
	 Deterministic and random signals
	 Description of LTI systems by differential equations or difference equations, respectively
	 Basic properties of signals and operations on signals
	Elementary signals
	Distributions (Generalized Functions)
	 Power and energy of signals
	 Correlation functions of deterministic signals
	 Autocorrelation function
	■ Crosscorrelation function
	 Orthogonal signals
	 Applications of correlation
	Linear time-invariant (LTI) systems

- Linearity
- Time-invariance
- o Description of LTI systems by impulse response and frequency response
- Convolution
- Convolution and correlation
- · Properties of LTI-systems
- Causal systems
- Stable systems
- o Memoryless systems
- Fourier Series and Fourier Transform
 - $\circ \quad \text{Fourier transform of continuous-time signals, discrete-time signals, periodic signals, non-periodic signals}\\$
 - o Properties of the Fourier transform
 - Fourier transform of some basic signals
 - o Parseval's theorem
- Analysis of LTI-systems and signals in the frequency domain
 - Frequency response, magnitude response and phase response
 - Transmission factor, attenuation, gain
 - Frequency-flat and frequency-selective LTI-systems
 - · Bandwidth definitions
 - Basic types of systems (filters), lowpass, highpass, bandpass, bandstop systems
 - o Phase delay and group delay
 - Linear-phase systems
 - Distortion-free systems
 - Spectrum analysis with limited observation window: Leakage effect
- Laplace Transform
 - Relation of Fourier transform and Laplace transform
 - Properties of the Laplace transform
 - Laplace transform of some basic signals
- · Analysis of LTI-systems in the s-domain
 - · Transfer function of LTI-systems
 - o Relation of Laplace transform, magnitude response and phase response
 - o Analysis of LTI-systems using pole-zero plots
 - o Allnass filters
 - Minimum-phase, maximum-phase and mixed phase filters
 - Stable systems
- Sampling
 - Sampling theorem
 - Reconstruction of continuous-time signals in frequency domain and time domain
 - Oversampling
 - Aliasing
 - Sampling with pulses of finite duration, sample and hold
 - Decimation and interpolation
- Discrete-Time Fourier Transform (DTFT)
 - Relation of Fourier transform and DTFT
 - Properties of the DTFT
- Discrete Fourier Transform (DFT)
 - Relation of DTFT and DFT
 - Cyclic properties of the DFT
 - DFT matrix
 - Zero padding
 - Cyclic convolution
 - Fast Fourier Transform (FFT)
 - ${\color{gray} \bullet} \ \ \, \text{Application of the DFT: Orthogonal Frequency Division Multiplex (OFDM)} \\$
- Z-Transform
 - $\circ~$ Relation of Laplace transform, DTFT, and z-transform
 - Properties of the z-transform
 - Z-transform of some basic discrete-time signals
- Discrete-time systems, digital filters
 - FIR and IIR filters
 - Z-transform of digital filters
 - Analysis of discrete-time systems using pole-zero plots in the z-domain
 - Stability
 - Allpass filters
 - Minimum-phase, maximum-phase and mixed-phase filters
 - Linear phase filters

Skills	Students can model problems in Mathematics	IV with the help of the concepts studie	d in this course	. Moreover, they are
	capable of solving them by applying establishe			,
	 Students are able to discover and verify furthe 	r logical connections between the concep	ts studied in the	e course.
	For a given problem, the students can devel	op and execute a suitable approach, ar	d are able to c	ritically evaluate the
	results.			
Personal Competence				
Social Competence				
,	 Students are able to work together in teams. T 			-
	 In doing so, they can communicate new conce 		erating partners	. Moreover, they can
	design examples to check and deepen the und	erstanding of their peers.		
Autonomy	 Students are capable of checking their unders 	tanding of complex concepts on their ov	vn. Thev can sp	ecify open questions
	precisely and know where to get help in solving			
	Students have developed sufficient persistence		in a goal-orien	ted manner on hard
	problems.	- '

Content	This course is intended as an introduction to the topics of wave propagation, guiding, sending, and receiving as well as Electromagnetic Compatibility (EMC). It will be useful for engineers that face the technical challenge of transmitting high frequency / high bandwidth data in e.g. medical, automotive, or avionic applications. Both circuit and field concepts of wave propagation and Electromagnetic Compatibility will be introduced and discussed. Topics: - Fundamental properties and phenomena of electrical circuits - Steady-state sinusoidal analysis of electrical circuits - Fundamental properties and phenomena of electromagnetic fields and waves - Steady-state sinusoidal description of electromagnetic fields and waves - Steady-state sinusoidal description of electromagnetic fields and waves - Useful microwave network parameters - Transmission lines and basic results from transmission line theory - Plane wave propagation, superposition, reflection and refraction - General theory of waveguides - Most important types of waveguides and their properties - Radiation and basic antenna parameters - Most important types of antennas and their properties - Numerical techniques and CAD tools for waveguide and antenna design - Fundamentals of Electromagnetic Compatibility - Coupling mechanisms and countermeasures - Shielding, grounding, filtering - Standards and regulations - EMC measurement techniques

Content	In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs.
	In the second part of the lecture an introduction to Internet security is given. This class comprises: Application layer protocols (HTTP, FTP, DNS) Transport layer protocols (TCP, UDP) Network Layer (Internet Protocol, routing in the Internet) Data link layer with media access at the example of Ethernet Multimedia applications in the Internet Network management Internet security: IPSec Internet security: Firewalls

Knowledge	Mathematics I, Mathematics II, Mathematics III, Mathe	ematics IV		
Educational Objectives	After taking part successfully, students have reached	the following learning results		
Professional Competence				
Knowledge	Students are able to explain fundamental form electromagnetic fields. They can assess the principal regard to respective sources. They can describe the solutions for simple fields. The students are aware of able to explicate these.	behavior and characteristics of quasist properties of complex electromagnetic	ationary and fully c fields by means	dynamic fields with s of superposition of
Skills	Students are able to apply a variety of procedures in order to solve the diffusion and the wave equation for general time-dependent field problems. They can assess the principal effects of given time-dependent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of fully dynamic fields (wave impedance, skin depth, Poynting-vector, radiation resistance, etc.) from given fields and interpret them with regard to practical applications.			
Personal Competence				
Social Competence	Students are able to work together on subject related during exercise sessions).	d tasks in small groups. They are able to	o present their re	sults effectively (e.g.
Autonomy	Students are capable to gather necessary information able to continually reflect their knowledge by means lectures and exercises that are related to the exam. I learning process. They are able to draw connecti University of Technology (TUHH), e.g. in the area of h	of activities that accompany the lecture Based on respective feedback, students ons between acquired knowledge and	, such as short or are expected to a	al quizzes during the djust their individua

Content	- Theory and principal characteristics of quasistationary electromagnetic fields
	- Electromagnetic induction and law of induction
	- Skin effect and eddy currents
	- Shielding of time variable magnetic fields
	- Theory and principal characteristics of fully dynamic electromagnetic fields
	- Wave equations and properties of planar waves
	- Polarization and superposition of planar waves
	- Reflection and refraction of planar waves at boundary surfaces
	- Waveguide theory
	- Rectangular waveguide, planar optical waveguide
	- Elektrical and magnetical dipol radiation
	- Simple arrays of antennas
	The practical application of numerical methods will be trained within specifically prepared lectures in an interactive manner using
	small MATLAB programs.

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Christian Becker
Language	DE
Cycle	WiSe
Content	fundamentals and current development trends in electric power engineering
	tasks and history of electric power systems
	symmetric three-phase systems
	fundamentals and modelling of eletric power systems
	• lines
	• transformers
	synchronous machines
	induction machines
	o loads and compensation
	grid structures and substations
	fundamentals of energy conversion
	electro-mechanical energy conversion
	• thermodynamics
	power station technology
	renewable energy conversion systems
	steady-state network calculation
	network modelling
	load flow calculation
	• (n-1)-criterion
	symmetric failure calculations, short-circuit power
	control in networks and power stations
	grid protection
	grid planning
	power economy fundamentals

Courses							
Title	Typ Hrs/wk CP						
Numerical Mathematics I (L0417)	Lecture 2 3						
Numerical Mathematics I (L0418)	Recitation Section (small) 2 3						
Module Responsible	Prof. Sabine Le Borne						
Admission Requirements	None						
Recommended Previous							
Knowledge	 Mathematik I + II for Engineering Students (german or english) or Analysis & Linear Algebra I + II for Technomathematicians basic MATLAB/Python knowledge 						
Educational Objectives	After taking part successfully, students have reached the following learning results						
Professional Competence							
Knowledge	Students are able to						
	 name numerical methods for interpolation, integration, least squares problems, eigenvalue problems, nonlinear root finding problems and to explain their core ideas, repeat convergence statements for the numerical methods, explain aspects for the practical execution of numerical methods with respect to computational and storage complexitx. 						
Skills	Students are able to implement, apply and compare numerical methods using MATLAB/Python, justify the convergence behaviour of numerical methods with respect to the problem and solution algorithm, select and execute a suitable solution approach for a given problem.						
Personal Competence							
Social Competence	Students are able to						
Autonomy	 work together in heterogeneously composed teams (i.e., teams from different study programs and background knowledge), explain theoretical foundations and support each other with practical aspects regarding the implementation of algorithms. Students are capable 						
, account	 to assess whether the supporting theoretical and practical excercises are better solved individually or in a team, to assess their individual progess and, if necessary, to ask questions and seek help. 						
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56						
Credit points	6						
Course achievement	None						
Examination	Written exam						
Examination duration and scale	90 minutes

the individual building blocks using knowledge of signal and system theory as well as the theory of stochastic processes. The
aware of the essential resources and evaluation criteria of information transmission and are able to design and evaluate a ba
communications system.
The students are familiar with the contents of lecture and tutorials. They can explain and apply them to new problems.
Skills The students are able to design and evaluate a basic communications system. In particular, they can estimate the requir
resources in terms of bandwidth and power. They are able to assess essential evaluation parameters of a basic communication
system such as bandwidth efficiency or bit error rate and to decide for a suitable transmission method.
Personal Competence
Social Competence The students can jointly solve specific problems.
Social competence The students can jointly solve specific problems.
Autonomy The students are able to acquire relevant information from appropriate literature sources. They can control their level
knowledge during the lecture period by solving tutorial problems, software tools, clicker system.

Cycle						
Content						
	Introduction to communications engineering					
	Open Systems Interconnection (OSI) reference model					
	Components of a digital communications system					
	Fundamentals of signals and systems					
	Analog and digital signals					
	Principles of Analog-to-digital (A/D) conversion					
	Deterministic and random signals					
	Power and energy of signals					
	Linear time-invariant (LTI) systems					
	Quadrature amplitude modulation (QAM)					
	Introduction to stochastics					
	Probability theory					
	Random experiments					
	Probability model, probability space, sample space					
	Definitions of probability					
	 Probability according to Bernoulli/Laplace 					
	 Probability according to van Mises, relative frequency 					
	■ Bertrand's paradox					
	 Axiomatic definition of probability according to Kolmogorov 					
	Probability of disjoint and non-disjoint events					
	Venn diagrams					
	Continuous and discrete random variables					

- Probability density function (pdf), cululative distribution function (cdf)
- Expected value, mean, median, quadratic mean, variance, standard deviation, higher moments
- Examples for probability distributions (Bernoulli distribution, two-point distribution, uniform distribution, Gaussian (normal) distribution, Rayleigh distribution, etc.)
- Multiple random variables
 - Conditional probability, joint probability
 - Conditional and joint probability density function
 - Bayes' rule
 - Correlation coefficient
 - Two-dimensional Gaussian distribution
 - Statistically independent, uncorrelated and orthogonal random variables
 - Independent identically distributed (iid) random variables
 - Properties of expected value and variance
 - Covariance
 - Probability density function (pdf) and cumulative distribution function (cdf) of the sum of statistically independent random variables
 - Central limit theorem
- Probability density functions (pdfs) in data transmission
- Continuous-time and discrete-time random processes
 - Examples for random processes
 - Ensemble average and time average
 - · Ergodic random processes
 - Ouadratic mean and variance
 - Probability density function (pdf) and cumulative distribution function (cdf)
 - Joint probability density function (pdf) and joint cumulative distribution function (cdf)
 - Statistically independent, uncorrelated and orthogonal random processes
 - Stationary random processes
 - Correlation functions: Autocorrelation function, crosscorrelation function, average autocorrelation function of nonstationary random processes, autocorrelation and crosscorrelation function of stationary processes, autocovariance function, crosscovariance function
 - Autocorrelation matrix, crosscorrelation matrix, autocovariance matrix, crosscovariance matrix
 - o Pseudo-noise sequences, example: Code division multiple access (CDMA)
 - Autocorrelation function, power spectral density (psd), signal power, Einstein-Wiener-Khintchine relations
 - · White (Gaussian) noise
- Filtering of random processes by LTI systems
 - Transformation of the probability density function (pdf)
 - Transformation of the mean
 - Transformation of the power spectral density (psd)
 - Correlation functions of input and output signal
 - Filtering of white Gaussian noise
 - Bandlimitation for noise power limitation
 - o Preemphasis and deemphasis
- Companding, mu-law, A-law
- Functions of random variables
 - Transformation of probabilities and of the probability density function (pdf)
 - Application: Non-linear amplifiers
- Functions of two random variables
 - Probability density function
 - Examples: Rayleigh distribution, magnitude of an OFDM signal, magnitude of a received radio signal
- Transmission channels and channel models
 - Wireline channels: Telephone cable, coaxial cable, optical fiber
 - Wireless channels: Fading radio channel, underwater channels
 - Frequency-flat and frequency-selective channels
 - Additive white Gaussian noise (AWGN) channel
 - Signal to noise power ratio (SNR)
 - o Discrete-time channel models
 - Discrete memoryless channels (DMC)
- Analog-to-digital conversion
 - Sampling
 - Sampling theorem
 - Pulse modulation
 - Pulse-amplitude modulation (PAM)
 - Pulse-duration modulation (PDM), pulse-width modulation (PWM)
 - Pulse-position modulation (PPM)
 - Pulse-code modulation (PCM)
 - Ouantization
 - Linear quantizaton, midtread and midrise characteristic
 - Quantization error, quantization noise
 - Signal-to-quantization noise ratio
 - Non-linear quantization, compressor characteristics, mu-law, A-law
 - Speech transmission with PCM
 - Differential pulse-code modulation (DPCM)
 - Linear prediction according to the minimum mean squared error (MMSE) criterion.
 - DPCM with forward prediction and backward prediction
 - SNR gain of DPCM over PCM

Delta modulation

- Fundamentals of information theory and coding
 - o Definitions of information: Self-information, entropy
 - Binary entropy function
 - Source coding theorem
 - Source coding: Huffman code
 - Mutual information and channel capacity
 - Channel capacity of the AWGN channel and the binary input AWGN channel
 - Channel coding theorem
 - Principles of channel coding: Code rate and data rate, Hamming distance, minimum Hamming distance, error detection and error correction
 - Examples for channel codes: Block codes and convolutional codes, repetition code, single parity check code,
 Hamming code, Turbo codes
- Combinatorics
 - · Variation with and without repetition
 - o Combination with and without repetition
 - Permutation. Permutation of multisets
 - Word error probabilities of linear block codes
- · Baseband transmission
 - Pulse shaping: Non-return to zero (NRZ) rectangular pulses, Manchester pulses, raised-cosine pulses, square-root raised-cosine pulses, Gaussian pulses
 - Transmit signal energy, average energy per symbol
 - o Power spectral density (psd) of baseband signals
 - Definitions of signal bandwidth
 - Bandwidth efficiency
 - Intersymbol interference (ISI)
 - o First and second Nyquist criterion
 - Eye patterns
 - · Receive filter design: Matched filter
 - o Matched-filter receiver and correlation receiver
 - · Square-root Nyquist pulse shaping
 - Discrete-time AWGN channel model
- Maximum a posteriori probability (MAP) and maximum likelihood (ML) detection
- Bit error probability in AWGN channels for binary antipodal and on-off signaling
- Band-pass transmission via carrier modulation
 - Amplitude modulation, frequency modulation, phase modulation
 - Linear digital modulation methods: On-off keying (OOK), phase-shift keying (PSK), amplitude shift keying (ASK), quadrature amplitude shift keying (QAM)

Module M1242: Quan	tum Mechanic	s for Engineers				
Courses						
Title				Тур	Hrs/wk	СР
Quantum Mechanics for Engineers	(L1686)			Lecture	2	3
Quantum Mechanics for Engineers	(L1688)			Recitation Section (small)	2	3
Module Responsible	NN					
Admission Requirements	None					
Recommended Previous Knowledge	 Knowledge in physics, particularly in optics and wave phenomena; knowledge in mathematics, particularly linear algebra, vector calculus, complex numbers and Fourier expansion 					
Educational Objectives	After taking part su	ccessfully, students have r	reached the following	ng learning results		
Professional Competence						
	The students are able to describe and explain basic terms and principles of quantum mechanics. They can distinguish commons and differences to classical physics and know, in which situations quantum mechanical phenomena may be expected. The students get the ability to apply concepts and methods of quantum mechanics to simple problems and systems. Vice versa, they are also able to comprehend requirements and principles of quantum mechanical devices.					
Personal Competence						
Social Competence	The students discuss contents of the lectures and present solutions to simple quantum mechanical problems in small groups during the exercises.					
Autonomy	The students are able to independently find answers to simple questions on quantum mechanical systems. The students are able to independently comprehend literature to more complex subjects with quantum mechanical background.

	This lecture introduces into fundamental concepts, methods, and definitions in quantum mechanics, which are needed in modern material and device science. Applications will be discussed using examples in the field of electronic and optical devices. Central topics are: Schrödinger equation, wave function, operators, eigenstates, eigenvalues, quantum wells, harmonic oscillator, tunnel processes, resonant tunnel diode, band structure, density of states, quantum statistics, Zener-diode, stationary perturbation calculation with the quantum-confined Stark effect as an example, Fermi's golden rule and transition matrix elements, heterostructure laser, quantum cascade laser, many-particle physics, molecules and exchange interaction, quantum bits and quantum cryptography.

	The lecture Engineering Mechanics II introduces the fundamental concepts of stress and strain and explains how these can be used to characterize and compute elastic deformations of mechanical bodies under loading. The focus of the lecture lies on: • basis of continuum mechanics: stress, strain, constitutive laws • truss • torsion bar • beam theory: bending, moment of inertia of area, transverse shear • energy methods: Maxwell-Betti reciprocal work theorem, Castigliano's second theorem, theorem of Menabrea • strength of materials: maximum principle stress criterion, yield criteria according to Tresca and von Mises • stability of mechanical structures: Euler buckling strut

Thesis

Module M-001: Bache	lor Thesis
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	According to General Regulations §21 (1):
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods).
	 On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise. The students are able to outline the state of research on a selected issue in their subject area.
CL III	
Skills	 The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems.
	 With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions. The students can take up a critical position on the findings of their own research work from a specialized perspective.
Personal Competence Social Competence	 Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way. The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly.
Autonomy	 The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame. The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem. The students can apply the essential techniques of scientific work to research of their own.
Workload in Hours	Independent Study Time 360, Study Time in Lecture 0
Credit points	
Course achievement	
Examination	Thesis
	According to General Regulations
scale	According to deficial negalitations
Assignment for the	General Engineering Science (German program): Thesis: Compulsory
Following Curricula	
	Civil- and Environmental Engineering: Thesis: Compulsory
	Bioprocess Engineering: Thesis: Compulsory
	Chemical and Bioprocess Engineering: Thesis: Compulsory
	Computer Science: Thesis: Compulsory
	Data Science: Thesis: Compulsory
	Digital Mechanical Engineering: Thesis: Compulsory
	Electrical Engineering: Thesis: Compulsory
	Energy and Environmental Engineering: Thesis: Compulsory
	Engineering Science: Thesis: Compulsory
	General Engineering Science (English program): Thesis: Compulsory
	General Engineering Science (English program, 7 semester): Thesis: Compulsory
	Green Technologies: Energy, Water, Climate: Thesis: Compulsory
	Computer Science in Engineering: Thesis: Compulsory
	Integrated Building Technology: Thesis: Compulsory
	Logistics and Mobility: Thesis: Compulsory Machanical Engineering: Thesis: Compulsory
	Mechanical Engineering: Thesis: Compulsory
	Mechatronics: Thesis: Compulsory Naval Architecture: Thesis: Compulsory
	Technomathematics: Thesis: Compulsory
	Teilstudiengang Lehramt Elektrotechnik-Informationstechnik: Thesis: Compulsory
	Teilstudiengang Lehramt Metalltechnik: Thesis: Compulsory
	Process Engineering: Thesis: Compulsory

Engineering and Management - Major in Logistics and Mobility: Thesis: Compulsory
