Program description	3
Core Qualification	5
Module M0642: Physics for Engineers	5
Module M0743: Electrical Engineering I: Direct Current Networks and Electromagnetic Fields	7
Module M1692: Computer Science for Engineers - Introduction and Overview	8
Module M0829: Foundations of Management	9
Module M0850: Mathematics I	11
Module M1755: Linking theory and practice (dual study program, Bachelor's degree)	13
Module M1750: Practical module 1 (dual study program, Bachelor's degree)	14
Module M0547: Electrical Engineering II: Alternating Current Networks and Basic Devices	16
Module M0748: Materials in Electrical Engineering	19
Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication	23
Module M0851: Mathematics II	25
Module M1751: Practical module 2 (dual study program, Bachelor's degree)	27
Module M0783: Measurements: Methods and Data Processing	29
Module M0708: Electrical Engineering III: Circuit Theory and Transients	31
Module M0730: Computer Engineering	33
Module M0853: Mathematics III	35
Module M1752: Practical module 3 (dual study program, Bachelor's degree)	38
Module M0567: Theoretical Electrical Engineering I: Time-Independent Fields	40
Module M0672: Signals and Systems	42
Module M0610: Electrical Machines and Actuators	45
Module M0734: Electrical Engineering Project Laboratory	47
Module M0854: Mathematics IV	48
Module M1340: Introduction to Waveguides, Antennas, and Electromagnetic Compatibility	51
Module M1753: Practical module 4 (dual study program, Bachelor's degree)	53
Module M0568: Theoretical Electrical Engineering II: Time-Dependent Fields	55
Module M0662: Numerical Mathematics I	57
Module M0834: Computernetworks and Internet Security	59
Module M0675: Introduction to Communications and Random Processes	61
Module M1235: Electrical Power Systems I: Introduction to Electrical Power Systems	65
Module M0760: Electronic Devices	68
Module M1802: Engineering Mechanics I (Stereostatics)	70
Module M0833: Introduction to Control Systems	72
Module M1242: Quantum Mechanics for Engineers	74
Module M1754: Practical module 5 (dual study program, Bachelor's degree)	76
Module M0634: Introduction into Medical Technology and Systems	78
Module M0777: Semiconductor Circuit Design	80
Module M1803: Engineering Mechanics II (Elastostatics)	82
Module M0803: Embedded Systems	84
- hesis	86
Module M1800: Bachelor thesis (dual study program)	86

Program description

Content

The electrical industry is the second largest industrial sector in Germany after mechanical engineering in terms of the number of employees. With approx. 847,000 employees, a turnover of approx. 179 billion euros is achieved (based on the year 2016, source: de.statista.com). Electrical engineering is thus not only one of the "classical engineering sciences" but also one of the main drivers of national and international technical progress in recent decades.

In engineering terms, electrical engineering deals with research, development and, in general, the application of electrical signals, electrical energy and electromagnetic fields in corresponding components and circuits.

Due to the widely ramified fields of application, a high degree of specialisation is required in the profession. As a consequence, the vocational training of electrical engineers is in the area of tension between the breadth of the training (for the widest possible range of later uses) and the depth of the training (for current, subject-specific competences). Within the framework of the consecutive Bachelor's/Master's degree programmes in electrical engineering at the TUHH, the breadth of the subject is taught primarily during the Bachelor's degree programme and focal points are deepened in the Master's degree programme. The Bachelor's programme conveys the fundamentals of electrical engineering, information technology, computer science as well as mathematics and physics required for solving electrical engineering and information technology tasks. In addition to the technical canon of fundamentals, training in non-technical areas such as business administration, patents, management, humanities, law and philosophy is aimed for, which meets the modern professional requirements of an engineer.

In addition to the foundational curriculum taught at TUHH, seminars on developing personal skills are integrated into the dual study programme, in the context of transfer between theory and practice. These seminars correspond to the modern professional requirements expected of an engineer, as well as promoting the link between the two places of learning.

The intensive dual courses at TUHH integrating practical experience consist of an academic-oriented and a practice-oriented element, which are completed at two places of learning. The academic-oriented element comprises study at TUHH. The practice-oriented element is coordinated with the study programme in terms of content and time, and consists of practical modules and phases spent in an affiliate company during periods when there are no lectures.

Career prospects

Successful completion of the Bachelor's degree programme in Electrical Engineering enables an early career entry into the typical fields of activity in electrical engineering, in addition to taking up a Master's degree programme that provides more in-depth scientific knowledge. These include communications engineering, measurement and control engineering, microsystems engineering and nanoelectronics, electrical power engineering, high-frequency engineering and optical systems.

Electrical engineers are among the most sought-after academics on the labour market. A current evaluation of data from the Federal Employment Agency proves the increasing demand (Federal Employment Agency: "Berichte: Blickpunkt Arbeitsmarkt - Ingenieurinnen und Ingenieure", Nuremberg, 2018). While the number of registered unemployed continues to fall steadily, the number of registered vacancies is increasing significantly at the same time. At the same time, only a fraction of the advertised jobs are reported to the Federal Employment Agency, so that the supply of jobs currently exceeds the demand. Thus, as in previous years, the demand for electrical engineers - especially in the old federal states including Hamburg - cannot be met ("shortage of skilled workers").

In addition, students acquire basic professional and personal skills as part of the dual study programme that enable them to enter professional practice at an early stage and to go on to further study. Students also gain practical work experience through the integrated practical modules. Graduates of the dual course have broad foundational knowledge, fundamental skills for academic work and relevant personal competences.

Learning target

The desired learning outcomes of the degree programme are based on the objectives listed above. The focus is on enabling graduates to responsibly and competently perform an engineering activity in the various fields of activity in electrical engineering. The learning objectives are divided into the following categories: knowledge, skills, social competence and independence.

Knowledge

- Students can name and describe the mathematical-scientific fundamentals and methods of engineering sciences. This includes, in particular, elements of higher analysis and linear algebra as well as physics.
- Students can explain the fundamentals and methods of electrical engineering and information technology and can give an overview of their subject. Of particular importance are direct and alternating current theory, circuit technology, the theory of electromagnetic fields and waves, the materials and components of electrical engineering as well as systems theory with their respective methods.
- The students can explain the basics, methods and areas of application of the sub-disciplines of electrical engineering in detail. Important sub-disciplines are electrical power engineering, communications engineering, circuit technology, measurement technology and control engineering.
- Students can reproduce the fundamentals and methods of economics and can give an overview of the relevant social, ethical, ecological and economic boundary conditions of their subject.

Skills

- The students can independently work on research questions using suitable methods, document their chosen solution path and present it to an expert audience.
- Students can solve problems from the fields of analysis, linear algebra, function theory and the theory of differential equations using the methods they have learned
- The students can assess the current and voltage behaviour in electrical networks, dimension simple circuits and analyse networks in the time and frequency domain. They can use semiconductor components such as transistors and diodes as well as operational amplifiers in their areas of application. They are able to plan electrical power supply systems in basic outlines and analyse the operating behaviour of electrical machines and calculate typical variables. They are able to clarify metrological issues and apply methods for describing and processing measurement data.
- The students can model, programme and adapt simple algorithms. They can design and test software and estimate its complexity. They are able to distinguish between the different levels of abstraction of today's computing systems.
- The students can apply different methods to solve Maxwell's equations for electromagnetic field problems. They can derive typical quantities from the fields and dimension them for application in practice.
- The students can describe and analyse linear, time-invariant systems with the methods of signal and system theory. They are able to design and evaluate simple communication and control systems.
- The students can generally map typical problems to their basic knowledge, find suitable solution methods and implement them. They can appropriately document the chosen solution in writing and present it to an audience in a clearly structured manner.

Social competence

- Students are able to present the procedure and results of their work in a comprehensible manner, both orally and in writing.
- The students are able to communicate about the contents and problems of electrical engineering with experts and laypersons. They can react

appropriately to questions, additions and comments.

• The students are able to work in groups. They can define, distribute and integrate subtasks. They can make time arrangements and interact socially.

Competence to work independently

- The students are able to obtain necessary technical information and place it in the context of their knowledge
- The students can realistically assess their existing competences and work on deficits independently
- The students can learn complex topics and work on problems in a self-organised and self-motivated manner (lifelong learning).

By continually switching places of learnings throughout the dual study programme, it is possible for theory and practice to be interlinked. Students reflect theoretically on their individual professional practical experience, and apply the results of their reflection to new forms of practice. They also test theoretical elements of the course in a practical setting, and use their findings as a stimulus for theoretical debate.

Program structure

The curriculum of the Bachelor's degree programme in Electrical Engineering is structured as follows:

- Core qualification compulsory: 29 modules, 174 credit points (LP), 1st 6th semester.
- Core qualification compulsory elective: 4 modules, 24 LP, 4th, 5th and 6th semester
- Bachelor thesis: 12 LP, 6th semester

The total workload for the Bachelor's programme is 210 LP, with a semester distribution of 36/34/38/36/36/36 LP.

In addition to the subject modules, the core qualification also includes the following interdisciplinary modules:

- Fundamentals of business administration: 6 LP, 1st semester
- dual courses in the Bachelor: 6 LP, 1st 6th semester

The structural model of the dual study programme follows a module-differentiating approach. Given the practice-oriented element, the curriculum of the dual study programme is different compared to a standard Bachelor's course. Five practical modules are completed at the dual students' partner company as part of corresponding practical terms during lecture-free periods.

Core Qualification

Module M0642: Physi	cs for Engineer	s

Content	In the physics lab a number of key experiments on physical phenomena in mechanics, oscillatory and wave motion, thermodynamics, electricity, and optics will be conducted by the students under assistance of a lecturing tutor. The experiments are part of the physics education program presented in the course "Physics for TUHH-ET Engineers". Beyond teaching of fundamental physical background the objectives are basic skills in preparation and performing physical measurements, usage of physical equipment, analysis of the results and preparation of a report on the experimental data.
Literature	Zu den Versuchen gibt es individuelle Versuchsanleitungen, die vor der Versuchsdurchführung ausgegeben werden. Zum Teil müssen die zur Versuchsdurchführung notwendigen physikalischen Hintergründe selbstständig erarbeitet werden, wozu die zur Vorlesung "Physik für TUHH-ET Ingenieure" angegebene Literatur gut geeignet ist.

Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Module M1755: Linkir	ng theory and practice (dual study program, Bachelor's degree)
Module Responsible	Dr. Henning Haschke
Admission Requirements	None
Recommended Previous	none
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	Dual students
	can describe and classify selected classic and modern theories, concepts and methods
	related to self-management, and organising work and learning
	self-competence and
	social skills
	and apply them to specific situations, projects and plans in a personal and professional context.
Skills	Dual students
	 anticipate typical difficulties, positive and negative effects, as well as success and failure factors in the engineering sector, evaluate them and consider promising strategies and courses of action.
Personal Competence	
Social Competence	Dual students
	 work together in a problem-oriented and interdisciplinary manner as part of expert and work teams. are able to assemble and lead working groups.
	 present complex, subject-related solutions to problems to experts and stakeholders and can develop these further together.
Autonomy	Dual students
	define, reflect and evaluate goals for learning and work processes.
	design their learning and work processes independently and sustainably at the university and company.
	take responsibility for their learning and work processes.
	are able to consciously think through their ideas or actions and relate them to their self-image to develop conclusions for
	future action based on this.
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84
Credit points	6
Course achievement	None
Examination	Written elaboration
Examination duration and	Studienbegleitende und semesterübergreifende Dokumentation: Die Leistungspunkte für das Modul werden durch die Anfertigung
scale	eines digitalen Lern- und Entwicklungsberichtes (E-Portfolio) erworben. Dabei handelt es sich um eine fortlaufende Dokumentation
	und Reflexion der Lernerfahrungen und der Kompetenzentwicklung im Bereich der Personalen Kompetenz.

Admission Requirements	None			
Recommended Previous	Electrical Engineering I			
Knowledge	Mathematics I			
	Mathematics i			
	Direct current networks, complex numbers			
Educational Objectives	After taking part successfully, students have reach	ed the following learning results		
Professional Competence				
Knowledge	Students are able to reproduce and explain fund	amental theories, principles, and	methods related to the	theory of alternating
	currents. They can describe networks of linear ele			
	an overview of applications for the theory of alte			udents are capable of
	explaining the behavior of fundamental passive an	d active devices as well as their ir	npact on simple circuits.	
Skills	Students are capable of calculating parameters within simple electrical networks at alternating currents by means of a comple notation for voltages and currents. They can appraise the fundamental effects that may occur within electrical networks a alternating currents. Students are able to analyze simple circuits such as oscillating circuits, filter, and matching network quantitatively and dimension elements by means of a design. They can motivate and justify the fundamental elements of a electrical power supply (transformer, transmission line, compensation of reactive power, multiphase system) and are qualified t dimension their main features.			
Personal Competence Social Competence	Students are able to work together on subject rela	ted tasks in small groups. They are	e able to present their re	sults effectively.
Autonomy	Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as online tests and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of othe lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).

Content	The Hamiltonian approach to classical mechanics. Analysis of a simple oscillator.
	Analysis of vibrations in a one-dimensional lattice.
	Phononic bandgap Introduction to quantum mechanics
	Wave function, Schrödinger's equation, observables and measurements.
	Quantum mechanical harmonic oscillator and spectral decomposition.
	Symmetries, conserved quantities, and the labeling of states.
	Angular momentum
	The hydrogen atom
	Waves in periodic potentials
	Reciprocal lattice and reciprocal lattice vectors
	Band gap
	Band diagrams The free electron gas and the density of states
	Fermi-Dirac distribution
	Density of charge carriers in semiconductors
	Conductivity in semiconductors. Engineering conductivity through doping.
	The P-N junction (diode)
	Light emitting diodes
	Electromagnetic waves interacting with materials
	Reflection and refraction Photonic band gaps
	Origins of magnetization
	Hysteresis in ferromagnetic materials
	Magnetic domains

Course L2880: Practical term	n 2 (dual study program, Bachelor's degree)		
Тур			
Hrs/wk	0		
СР	6		
Workload in Hours	Independent Study Time 180, Study Time in Lecture 0		
Lecturer	Dr. Henning Haschke		
Language	DE		
Cycle	SoSe		
Content	Company onboarding process		
	Assigning work areas (supervisor, colleagues)		
	Assigning a contact person within the company (usually the HR department)		
	Assigning a professional mentor in the work area (relating to practical application)		
	Responsibilities and authorisations of the dual student within the company		
	Supporting/working with colleagues		
	Scheduling the relevant practical modules with work tasks		
	Theory/practice transfer options		
	Scheduling the examination phase/subsequent study semester		
	Operational knowledge and skills		
	 Company-specific: organisational structure, corporate strategy, business and work areas, work procedures and processes, operational levels 		
	Process and procedure options within the labour-market-relevant field of engineering		
	Operational equipment and resources		
	 Implementing the university's application recommendations (theory-practice transfer) in corresponding work and task areas across the company 		
	Sharing/reflecting on learning		
	Creating an e-portfolio		
	Relevance of foundational subjects when working as an engineer		
	Comparing the learning and working processes of different learning environments with regard to their results and effects		
Literature	Studierendenhandbuch		
	Betriebliche Dokumente		
	Hochschulseitige Anwendungsempfehlungen zum Theorie-Praxis-Transfer

After successful completion of the module, the students are able to judge the interdependencies between a physical computer system and the software executed on it. In particular, they shall understand the consequences that the execution of software has on the hardware-centric abstraction layers from the assembly language down to gates. This way, they will be enabled to evaluate the impact that these low abstraction levels have on an entire system's performance and to propose feasible options. Knowledge				
Educational Objectives	After taking part successfully, students have reached the	e following learning results		
Professional Competence				
Knowledge	Students can name the basic concepts in the area of analysis and differential equations. They are able to explain them using			
	 appropriate examples. Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples. They know proof strategies and can reproduce them. 			
Skills	Students can model problems in the area of analysis and differential equations with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods. Students are able to discover and verify further logical connections between the concepts studied in the course. For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.			
Personal Competence				
Social Competence	 Students are able to work together in teams. They are capable to use mathematics as a common language. In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can 			
	design examples to check and deepen the unders			
Autonomy		alian of accordance and accordance and aliana	Th	:6
	 Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them. Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard 			
	problems.

	Prof. Christian Schuster	,		
Admission Requirements				
	Basic principles of electrical engineering and adv	vanced mathematics		
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence Knowledge	Students can explain the fundamental formulas, relations, and methods of the theory of time-independent electromagnetic fields. They can explicate the principal behavior of electrostatic, magnetostatic, and current density fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-independent electromagnetic fields and are able to explicate these.			
Skills	Students can apply Maxwell's Equations in integral notation in order to solve highly symmetrical, time-independent electromagnetic field problems. Furthermore, they are capable of applying a variety of methods that require solving Maxwell' Equations for more general problems. The students can assess the principal effects of given time-independent sources of fields an analyze these quantitatively. They can deduce meaningful quantities for the characterization of electrostatic, magnetostatic, and electrical flow fields (capacitances, inductances, resistances, etc.) from given fields and dimension them for practical applications.			
Personal Competence Social Competence	Students are able to work together on subject reduring exercise sessions).	elated tasks in small groups. They are able	to present their re	sults effectively (e.
Autonomy	Students are capable to gather necessary information from provided references and relate this information to the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individua learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of othe lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).

Workload in Hours	Independent Study Time 108, Study Time in Lecture 42	
Lecturer	Prof. Christian Schuster	
Language	DE	
Cycle	SoSe	
Content	- Maxwell's Equations in integral and differential notation	
	- Boundary conditions	
	- Laws of conservation for energy and charge	
	- Classification of electromagnetic field properties	
	- Integral characteristics of time-independent fields (R, L, C)	
	- Generic approaches to solving Poisson's Equation	
	- Electrostatic fields and specific methods of solving	
	- Magnetostatic fields and specific methods of solving	
	- Fields of electrical current density and specific methods of solving	
	- Action of force within time-independent fields	
	- Numerical methods for solving time-independent problems	
	The practical application of numerical methods will be trained within specifically prepared lectures in an interactive manner using small MATLAB programs.

Module M0672: Signa	Is and Systems	
Courses		
Title Signals and Systems (L0432) Signals and Systems (L0433)	Typ Hrs/wk CP Lecture 3 4 Recitation Section (small) 2 2	
Module Responsible	Prof. Gerhard Bauch	
Admission Requirements	None	
Recommended Previous	Mathematics 1-3	
Knowledge		
	The modul is an introduction to the theory of signals and systems. Good knowledge in maths as covered by the moduls Mathemati 1-3 is expected. Further experience with spectral transformations (Fourier series, Fourier transform, Laplace transform) is useful but not required.	
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	The students are able to classify and describe signals and linear time-invariant (LTI) systems using methods of signal and system theory. They are able to apply the fundamental transformations of continuous-time and discrete-time signals and systems. They can describe and analyse deterministic signals and systems mathematically in both time and image domain. In particular, they understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a discrete-time signal.	
	The students are familiar with the contents of lecture and tutorials. They can explain and apply them to new problems.	
Skills	The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and system theory. They can analyse and design basic systems regarding important properties such as magnitude and phase response, stability, linearity etc They can assess the impact of LTI systems on the signal properties in time and frequency domain	
Personal Competence		
Social Competence	The students can jointly solve specific problems.	
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level o	
	knowledge during the lecture period by solving tutorial problems, software tools, clicker system.

Content	Introduction to signal and system theory
	• Signals
	Classification of signals
	■ Continuous-time and discrete-time signals
	 Analog and digital signals
	 Deterministic and random signals
	 Description of LTI systems by differential equations or difference equations, respectively
	 Basic properties of signals and operations on signals
	Elementary signals
	Distributions (Generalized Functions)
	 Power and energy of signals
	 Correlation functions of deterministic signals
	 Autocorrelation function
	■ Crosscorrelation function
	 Orthogonal signals
	 Applications of correlation
	Linear time-invariant (LTI) systems

- Linearity
- Time-invariance
- o Description of LTI systems by impulse response and frequency response
- Convolution
- Convolution and correlation
- · Properties of LTI-systems
- Causal systems
- Stable systems
- o Memoryless systems
- Fourier Series and Fourier Transform
 - $\circ \quad \text{Fourier transform of continuous-time signals, discrete-time signals, periodic signals, non-periodic signals}\\$
 - o Properties of the Fourier transform
 - Fourier transform of some basic signals
 - · Parseval's theorem
- Analysis of LTI-systems and signals in the frequency domain
 - Frequency response, magnitude response and phase response
 - Transmission factor, attenuation, gain
 - Frequency-flat and frequency-selective LTI-systems
 - · Bandwidth definitions
 - Basic types of systems (filters), lowpass, highpass, bandpass, bandstop systems
 - o Phase delay and group delay
 - Linear-phase systems
 - Distortion-free systems
 - Spectrum analysis with limited observation window: Leakage effect
- Laplace Transform
 - Relation of Fourier transform and Laplace transform
 - Properties of the Laplace transform
 - Laplace transform of some basic signals
- · Analysis of LTI-systems in the s-domain
 - · Transfer function of LTI-systems
 - o Relation of Laplace transform, magnitude response and phase response
 - o Analysis of LTI-systems using pole-zero plots
 - o Allnass filters
 - Minimum-phase, maximum-phase and mixed phase filters
 - Stable systems
- Sampling
 - Sampling theorem
 - Reconstruction of continuous-time signals in frequency domain and time domain
 - Oversampling
 - Aliasing
 - Sampling with pulses of finite duration, sample and hold
 - Decimation and interpolation
- Discrete-Time Fourier Transform (DTFT)
 - Relation of Fourier transform and DTFT
 - Properties of the DTFT
- Discrete Fourier Transform (DFT)
 - Relation of DTFT and DFT
 - Cyclic properties of the DFT
 - DFT matrix
 - Zero padding
 - Cyclic convolution
 - Fast Fourier Transform (FFT)
 - $\bullet \ \ \mbox{Application of the DFT: Orthogonal Frequency Division Multiplex (OFDM)}$
- Z-Transform
 - $\circ~$ Relation of Laplace transform, DTFT, and z-transform
 - Properties of the z-transform
 - Z-transform of some basic discrete-time signals
- Discrete-time systems, digital filters
 - FIR and IIR filters
 - Z-transform of digital filters
 - Analysis of discrete-time systems using pole-zero plots in the z-domain
 - Stability
 - Allpass filters
 - Minimum-phase, maximum-phase and mixed-phase filters
 - Linear phase filters

Hrs/wk	8
СР	6
Workload in Hours	Independent Study Time 68, Study Time in Lecture 112
Lecturer	Prof. Christian Becker, Dozenten des SD E
Language	DE
Cycle	SoSe
Content	Topics and projects cover the entire field of applications of electrical engineering. Typically, the students will prototype functional units and self-contained systems, such as radar devices, networks of sensors, amateur radio transceiver, power electronics based inverters, discrete computers, or atomic force microscopes. Different projects are devised on a yearly basis.
Literature	Alle zur Durchführung der Projekte sinnvollen Quellen (Skripte, Fachbücher, Manuals, Datenblätter, Internetseiten). / All sources that are useful for completion of the projects (lecture notes, textbooks, manuals, data sheets, internet pages).

Knowledge				
Educational Objectives	After taking part successfully, students have reached	the following learning results		
Professional Competence	3,	3 3		
Knowledge				
	Students can name the basic concepts in Math	ematics IV. They are able to explain them	n using appropri	ate examples.
	Students can discuss logical connections betw	een these concepts. They are capable of	of illustrating th	ese connections with
	the help of examples.			
	 They know proof strategies and can reproduce 	them.		
Skills	Students can model problems in Mathematics	IV with the help of the concents studie	d in this course	Moreover they are
	capable of solving them by applying establishe		a iii ciiis coaisc	Horeover, they are
	Students are able to discover and verify further		ts studied in the	e course.
	For a given problem, the students can devel			
	results.	op and execute a saleable approach, an	ia are able to e	rideally evaluate the
	. Courts			
Personal Competence				
Social Competence				
Social Competence	 Students are able to work together in teams. T 	hey are capable to use mathematics as a	common langu	age.
	 In doing so, they can communicate new conce 	epts according to the needs of their coope	erating partners	. Moreover, they can
	design examples to check and deepen the und	lerstanding of their peers.		
Autonomy				
	Students are capable of checking their unders	- · · · ·	vn. They can sp	ecity open questions
	precisely and know where to get help in solvin			h. d
	Students have developed sufficient persistent	te to be able to work for longer periods	in a goai-orien	ited manner on nard
	problems.

Content	This course is intended as an introduction to the topics of wave propagation, guiding, sending, and receiving as well as Electromagnetic Compatibility (EMC). It will be useful for engineers that face the technical challenge of transmitting high frequency / high bandwidth data in e.g. medical, automotive, or avionic applications. Both circuit and field concepts of wave propagation and Electromagnetic Compatibility will be introduced and discussed. Topics: - Fundamental properties and phenomena of electrical circuits - Steady-state sinusoidal analysis of electrical circuits - Fundamental properties and phenomena of electromagnetic fields and waves - Steady-state sinusoidal description of electromagnetic fields and waves - Useful microwave network parameters - Transmission lines and basic results from transmission line theory - Plane wave propagation, superposition, reflection and refraction - General theory of waveguides - Most important types of waveguides and their properties - Radiation and basic antenna parameters - Most important types of antennas and their properties - Numerical techniques and CAD tools for waveguide and antenna design
	- Numerical techniques and CAD tools for waveguide and antenna design - Fundamentals of Electromagnetic Compatibility - Coupling mechanisms and countermeasures - Shielding, grounding, filtering - Standards and regulations - EMC measurement techniques

Module Responsible	Prof. Christian Schuster			
Admission Requirements	None			
Recommended Previous	Electrical Engineering I, Electrical Engineering II, Theoretical Electrical Engineering I			
Knowledge	Mathematics I, Mathematics II, Mathematics III, Mathe	ematics IV		
Educational Objectives	After taking part successfully, students have reached	the following learning results		
Professional Competence				
Knowledge	Students are able to explain fundamental formulas, relations, and methods related to the theory of time-dependent electromagnetic fields. They can assess the principal behavior and characteristics of quasistationary and fully dynamic fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-dependent electromagnetic fields and are able to explicate these.			
Skills	Students are able to apply a variety of procedures in order to solve the diffusion and the wave equation for general time-dependent field problems. They can assess the principal effects of given time-dependent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of fully dynamic fields (wave impedance, skin depth, Poynting-vector, radiation resistance, etc.) from given fields and interpret them with regard to practical applications.			
Personal Competence				
Social Competence	Students are able to work together on subject related during exercise sessions).	d tasks in small groups. They are able to	o present their re	sults effectively (e.g.
Autonomy	Students are capable to gather necessary information from provided references and relate this information to the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between acquired knowledge and ongoing research at the Hamburg University of Technology (TUHH), e.g. in the area of high frequency engineering and optics.

Content	- Theory and principal characteristics of quasistationary electromagnetic fields
	- Electromagnetic induction and law of induction
	- Skin effect and eddy currents
	- Shielding of time variable magnetic fields
	- Theory and principal characteristics of fully dynamic electromagnetic fields
	- Wave equations and properties of planar waves
	- Polarization and superposition of planar waves
	- Reflection and refraction of planar waves at boundary surfaces
	- Waveguide theory
	- Rectangular waveguide, planar optical waveguide
	- Elektrical and magnetical dipol radiation
	- Simple arrays of antennas
	The practical application of numerical methods will be trained within specifically prepared lectures in an interactive manner using small MATLAB programs.

Content	In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs. In the second part of the lecture an introduction to Internet security is given.
	This class comprises: Application layer protocols (HTTP, FTP, DNS) Transport layer protocols (TCP, UDP) Network Layer (Internet Protocol, routing in the Internet) Data link layer with media access at the example of Ethernet Multimedia applications in the Internet Network management Internet security: IPSec

Module M0675: Introduction to Communications and Random Processes					
Courses					
Title		Тур	Hrs/wk	СР	
Introduction to Communications an	nd Random Processes (L0442)	Lecture	3	4	
Introduction to Communications an	nd Random Processes (L0443)	Recitation Section (large)	1	1	
Introduction to Communications an	nd Random Processes (L2354)	Recitation Section (small)	1	1	
Module Responsible	Prof. Gerhard Bauch				
Admission Requirements	None				
Recommended Previous Knowledge	 Mathematics 1-3 				
Educational Objectives	After taking part successfully, students have reached	the following learning results			
Professional Competence					
Knowledge	The students know and understand the fundamental building blocks of a communications system. They can describe and analyse the individual building blocks using knowledge of signal and system theory as well as the theory of stochastic processes. The are aware of the essential resources and evaluation criteria of information transmission and are able to design and evaluate a basic communications system.				
	The students are familiar with the contents of lecture	and tutorials. They can explain and a	ipply them to new p	roblems.	
Skills	The students are able to design and evaluate a basic communications system. In particular, they can estimate the required resources in terms of bandwidth and power. They are able to assess essential evaluation parameters of a basic communications system such as bandwidth efficiency or bit error rate and to decide for a suitable transmission method.				
Personal Competence					
Social Competence	The students can jointly solve specific problems.	The students can jointly solve specific problems.			
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.				
Workload in Hours	Independent Study Time 110, Study Time in Lecture	70

Content				
	Introduction to communications engineering			
	Open Systems Interconnection (OSI) reference model			
	Components of a digital communications system			
	Fundamentals of signals and systems			
	Analog and digital signals			
	Principles of Analog-to-digital (A/D) conversion			
	Deterministic and random signals			
	Power and energy of signals			
	Linear time-invariant (LTI) systems Ouadrature amplitude modulation (OAM)			
	Quadrature amplitude modulation (QAM)			
	Introduction to stochastics			
	Probability theory			
	Random experiments			
	 Probability model, probability space, sample space 			
	Definitions of probability			
	 Probability according to Bernoulli/Laplace 			
	Probability according to van Mises, relative frequency			
	 Bertrand's paradox 			
	 Axiomatic definition of probability according to Kolmogorov 			
	 Probability of disjoint and non-disjoint events 			
	■ Venn diagrams			
	Continuous and discrete random variables			

- Probability density function (pdf), cululative distribution function (cdf)
- Expected value, mean, median, quadratic mean, variance, standard deviation, higher moments
- Examples for probability distributions (Bernoulli distribution, two-point distribution, uniform distribution, Gaussian (normal) distribution, Rayleigh distribution, etc.)
- Multiple random variables
 - Conditional probability, joint probability
 - Conditional and joint probability density function
 - Bayes' rule
 - Correlation coefficient
 - Two-dimensional Gaussian distribution
 - Statistically independent, uncorrelated and orthogonal random variables
 - Independent identically distributed (iid) random variables
 - Properties of expected value and variance
 - Covariance
 - Probability density function (pdf) and cumulative distribution function (cdf) of the sum of statistically independent random variables
 - Central limit theorem
- Probability density functions (pdfs) in data transmission
- Continuous-time and discrete-time random processes
 - Examples for random processes
 - Ensemble average and time average
 - · Ergodic random processes
 - Quadratic mean and variance
 - Probability density function (pdf) and cumulative distribution function (cdf)
 - Joint probability density function (pdf) and joint cumulative distribution function (cdf)
 - Statistically independent, uncorrelated and orthogonal random processes
 - Stationary random processes
 - Correlation functions: Autocorrelation function, crosscorrelation function, average autocorrelation function of nonstationary random processes, autocorrelation and crosscorrelation function of stationary processes, autocovariance function, crosscovariance function
 - Autocorrelation matrix, crosscorrelation matrix, autocovariance matrix, crosscovariance matrix
 - Pseudo-noise sequences, example: Code division multiple access (CDMA)
 - Autocorrelation function, power spectral density (psd), signal power, Einstein-Wiener-Khintchine relations
 - · White (Gaussian) noise
- Filtering of random processes by LTI systems
 - $\circ\hspace{0.1in}$ Transformation of the probability density function (pdf)
 - Transformation of the mean
 - Transformation of the power spectral density (psd)
 - Correlation functions of input and output signal
 - Filtering of white Gaussian noise
 - Bandlimitation for noise power limitation
 - Preemphasis and deemphasis
- Companding, mu-law, A-law
- Functions of random variables
 - Transformation of probabilities and of the probability density function (pdf)
 - Application: Non-linear amplifiers
- Functions of two random variables
 - Probability density function
 - Examples: Rayleigh distribution, magnitude of an OFDM signal, magnitude of a received radio signal
- Transmission channels and channel models
 - Wireline channels: Telephone cable, coaxial cable, optical fiber
 - Wireless channels: Fading radio channel, underwater channels
 - Frequency-flat and frequency-selective channels
 - Additive white Gaussian noise (AWGN) channel
 - Signal to noise power ratio (SNR)
 - o Discrete-time channel models
 - o Discrete memoryless channels (DMC)
- Analog-to-digital conversion
 - Sampling
 - Sampling theorem
 - Pulse modulation
 - Pulse-amplitude modulation (PAM)
 - Pulse-duration modulation (PDM), pulse-width modulation (PWM)
 - Pulse-position modulation (PPM)
 - Pulse-code modulation (PCM)
 - Quantization
 - Linear quantizaton, midtread and midrise characteristic
 - Quantization error, quantization noise
 - Signal-to-quantization noise ratio
 - Non-linear quantization, compressor characteristics, mu-law, A-law
 - Speech transmission with PCM
 - Differential pulse-code modulation (DPCM)
 - Linear prediction according to the minimum mean squared error (MMSE) criterion.
 - DPCM with forward prediction and backward prediction
 - SNR gain of DPCM over PCM

Delta modulation

- Fundamentals of information theory and coding
 - o Definitions of information: Self-information, entropy
 - Binary entropy function
 - Source coding theorem
 - Source coding: Huffman code
 - · Mutual information and channel capacity
 - Channel capacity of the AWGN channel and the binary input AWGN channel
 - Channel coding theorem
 - Principles of channel coding: Code rate and data rate, Hamming distance, minimum Hamming distance, error detection and error correction
 - Examples for channel codes: Block codes and convolutional codes, repetition code, single parity check code,
 Hamming code, Turbo codes
- Combinatorics
 - · Variation with and without repetition
 - o Combination with and without repetition
 - · Permutation. Permutation of multisets
 - Word error probabilities of linear block codes
- · Baseband transmission
 - Pulse shaping: Non-return to zero (NRZ) rectangular pulses, Manchester pulses, raised-cosine pulses, square-root raised-cosine pulses, Gaussian pulses
 - Transmit signal energy, average energy per symbol
 - o Power spectral density (psd) of baseband signals
 - Definitions of signal bandwidth
 - Bandwidth efficiency
 - Intersymbol interference (ISI)
 - o First and second Nyquist criterion
 - Eye patterns
 - · Receive filter design: Matched filter
 - o Matched-filter receiver and correlation receiver
 - · Square-root Nyquist pulse shaping
 - Discrete-time AWGN channel model
- Maximum a posteriori probability (MAP) and maximum likelihood (ML) detection
- Bit error probability in AWGN channels for binary antipodal and on-off signaling
- Band-pass transmission via carrier modulation
 - Amplitude modulation, frequency modulation, phase modulation
 - Linear digital modulation methods: On-off keying (OOK), phase-shift keying (PSK), amplitude shift keying (ASK), quadrature amplitude shift keying (QAM)

Lecturer	Prof. Wolfgang Hansen
Language	DE
Cycle	WiSe
	This lecture introduces into fundamental concepts, methods, and definitions in quantum mechanics, which are needed in modern material and device science. Applications will be discussed using examples in the field of electronic and optical devices. Central topics are: Schrödinger equation, wave function, operators, eigenstates, eigenvalues, quantum wells, harmonic oscillator, tunnel processes, resonant tunnel diode, band structure, density of states, quantum statistics, Zener-diode, stationary perturbation calculation with the quantum-confined Stark effect as an example, Fermi's golden rule and transition matrix elements, heterostructure laser, quantum cascade laser, many-particle physics, molecules and exchange interaction, quantum bits and quantum cryptography.

Thesis

Module M1800: Bache	elor thesis (dual study program)
Module M1800: Bache	eior thesis (duai study program)
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	None
Recommended Previous	
Knowledge	
•	After taking part successfully, students have reached the following learning results
Professional Competence	
knowieage	 Dual students choose central theoretical principles from their field of study (facts, theories, methods) in relation to problems and applications, present them and discuss them critically.
	 further develop their subject-related and practical knowledge as appropriate and link both areas of knowledge together. present the current research available on a chosen topic or on a chosen operational issue linked to their subject.
Skills	Dual students
	evaluate both the basic knowledge linked to their field of study acquired at the university and professional knowledge
	gained through the company, then purposefully use it to solve technical and application-related problems.
	• analyse questions and problems using the methods learned throughout their studies (including practical phases), reach
	factually justifiable decisions and develop application-specific solutions.
	critically analyse the results of their own research work from a subject-specific and professional perspective.
Personal Competence	Paul students
Social Competence	Dual students
	• present a professional problem in the form of an academic question for a specialist audience in a structured,
	comprehensible and factually correct manner, both orally and in writing. • respond to questions as part of a specialist discussion and answer them appropriately. In doing so, they argue their own
	evaluations and points of view convincingly.
Autonomy	Dual students
	• structure a comprehensive, chronological workflow and work independently on a question to a high academic level within
	a given period of time.
	identify, develop and link necessary knowledge and material to handle an academic and application-related problem. analytic acceptable techniques of academic years when academic and application related problem.
	apply the essential techniques of academic work when conducting their own research on an operational issue.
Workload in Hours	Independent Study Time 360, Study Time in Lecture 0
Credit points	
Course achievement	None
Examination	Thesis
	According to General Regulations
scale	
Assignment for the Following Curricula	General Engineering Science (German program, 7 semester): Thesis: Compulsory Civil- and Environmental Engineering: Thesis: Compulsory
Following Curricula	Chemical and Bioprocess Engineering: Thesis: Compulsory
	Computer Science: Thesis: Compulsory
	Data Science: Thesis: Compulsory
	Electrical Engineering: Thesis: Compulsory
	Engineering Science: Thesis: Compulsory
	Green Technologies: Energy, Water, Climate: Thesis: Compulsory
	Computer Science in Engineering: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory
	Mechatronics: Thesis: Compulsory
	Naval Architecture: Thesis: Compulsory
	Technomathematics: Thesis: Compulsory
	Engineering and Management - Major in Logistics and Mobility: Thesis: Compulsory
