| Program description  | 3  |
| Core Qualification   | 5  |
| Module M0577: Non-technical Courses for Bachelors  | 5  |
| Module M0642: Physics for Engineers  | 7  |
| Module M0743: Electrical Engineering I: Direct Current Networks and Electromagnetic Fields         | 9  |
| Module M0829: Foundations of Management  | 10 |
| Module M0850: Mathematics I  | 12 |
| Module M1692: Computer Science for Engineers - Introduction and Overview                           | 14 |
| Module M0547: Electrical Engineering II: Alternating Current Networks and Basic Devices            | 15 |
| Module M0748: Materials in Electrical Engineering  | 18 |
| Module M0851: Mathematics II   | 22 |
| Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication | 24 |
| Module M0783: Measurements: Methods and Data Processing  | 26 |
| Module M0708: Electrical Engineering III: Circuit Theory and Transients                            | 28 |
| Module M0730: Computer Engineering   | 30 |
| Module M0853: Mathematics III  | 32 |
| Module M0567: Theoretical Electrical Engineering I: Time-Independent Fields                        | 35 |
| Module M0610: Electrical Machines and Actuators  | 37 |
| Module M0672: Signals and Systems  | 39 |
| Module M0734: Electrical Engineering Project Laboratory  | 42 |
| Module M0854: Mathematics IV   | 44 |
| Module M1340: Introduction to Waveguides, Antennas, and Electromagnetic Compatibility              | 47 |
| Module M1962: Basics space electronics and primary mission   | 49 |
| Module M1235: Electrical Power Systems I: Introduction to Electrical Power Systems                 | 50 |
| Module M1802: Engineering Mechanics I (Stereostatics)  | 53 |
| Module M0568: Theoretical Electrical Engineering II: Time-Dependent Fields                         | 55 |
| Module M0662: Numerical Mathematics I  | 57 |
| Module M0675: Introduction to Communications and Random Processes                                  | 59 |
| Module M0760: Electronic Devices   | 63 |
| Module M0833: Introduction to Control Systems  | 65 |
| Module M0834: Computernetworks and Internet Security   | 67 |
| Module M0634: Introduction into Medical Technology and Systems                                     | 69 |
| Module M1803: Engineering Mechanics II (Elastostatics)   | 71 |
| Module M0777: Semiconductor Circuit Design   | 73 |
| Module M0803: Embedded Systems   | 75 |
| Thesis   | 77 |
| Module M-001: Bachelor Thesis  | 77 |

## Program description

---

---

### Content

The electrical industry is the second largest industrial sector in Germany after mechanical engineering in terms of the number of employees. With approx. 847,000 employees, a turnover of approx. 179 billion euros is achieved (based on the year 2016, source: de.statista.com). Electrical engineering is thus not only one of the "classical engineering sciences" but also one of the main drivers of national and international technical progress in recent decades.

In engineering terms, electrical engineering deals with research, development and, in general, the application of electrical signals, electrical energy and electromagnetic fields in corresponding components and circuits.

Due to the widely ramified fields of application, a high degree of specialisation is required in the profession. As a consequence, the vocational training of electrical engineers is in the area of tension between the breadth of the training (for the widest possible range of later uses) and the depth of the training (for current, subject-specific competences). Within the framework of the consecutive Bachelor's/Master's degree programmes in electrical engineering at the TUHH, the breadth of the subject is taught primarily during the Bachelor's degree programme and focal points are deepened in the Master's degree programme. The Bachelor's programme conveys the fundamentals of electrical engineering, information technology, computer science as well as mathematics and physics required for solving electrical engineering and information technology tasks. In addition to the technical canon of fundamentals, training in non-technical areas such as business administration, patents, management, humanities, law and philosophy is aimed for, which meets the modern professional requirements of an engineer.

### Career prospects

Successful completion of the Bachelor's degree programme in Electrical Engineering enables an early career entry into the typical fields of activity in electrical engineering, in addition to taking up a Master's degree programme that provides more in-depth scientific knowledge. These include communications engineering, measurement and control engineering, microsystems engineering and nanoelectronics, electrical power engineering, high-frequency engineering and optical systems.

Electrical engineers are among the most sought-after academics on the labour market. A current evaluation of data from the Federal Employment Agency proves the increasing demand (Federal Employment Agency: "Berichte: Blickpunkt Arbeitsmarkt - Ingenieurinnen und Ingenieure", Nuremberg, 2018). While the number of registered unemployed continues to fall steadily, the number of registered vacancies is increasing significantly at the same time. At the same time, only a fraction of the advertised jobs are reported to the Federal Employment Agency, so that the supply of jobs currently exceeds the demand. Thus, as in previous years, the demand for electrical engineers - especially in the old federal states including Hamburg - cannot be met ("shortage of skilled workers").

### Learning target

The desired learning outcomes of the degree programme are based on the objectives listed above. The focus is on enabling graduates to responsibly and competently perform an engineering activity in the various fields of activity in electrical engineering. The learning objectives are divided into the following categories: knowledge, skills, social competence and independence.

#### Knowledge

- Students can name and describe the mathematical-scientific fundamentals and methods of engineering sciences. This includes, in particular, elements of higher analysis and linear algebra as well as physics.
- Students can explain the fundamentals and methods of electrical engineering and information technology and can give an overview of their subject. Of particular importance are direct and alternating current theory, circuit technology, the theory of electromagnetic fields and waves, the materials and components of electrical engineering as well as systems theory with their respective methods.
- The students can explain the basics, methods and areas of application of the sub-disciplines of electrical engineering in detail. Important sub-disciplines are electrical power engineering, communications engineering, circuit technology, measurement technology and control engineering.
- Students can reproduce the fundamentals and methods of economics and can give an overview of the relevant social, ethical, ecological and economic boundary conditions of their subject.

#### Skills

- The students can independently work on research questions using suitable methods, document their chosen solution path and present it to an expert audience.
- Students can solve problems from the fields of analysis, linear algebra, function theory and the theory of differential equations using the methods they have learned
- The students can assess the current and voltage behaviour in electrical networks, dimension simple circuits and analyse networks in the time and frequency domain. They can use semiconductor components such as transistors and diodes as well as operational amplifiers in their areas of application. They are able to plan electrical power supply systems in basic outlines and analyse the operating behaviour of electrical machines and calculate typical variables. They are able to clarify metrological issues and apply methods for describing and processing measurement data.
- The students can model, programme and adapt simple algorithms. They can design and test software and estimate its complexity. They are able to distinguish between the different levels of abstraction of today's computing systems.
- The students can apply different methods to solve Maxwell's equations for electromagnetic field problems. They can derive typical quantities from the fields and dimension them for application in practice.
- The students can describe and analyse linear, time-invariant systems with the methods of signal and system theory. They are able to design and evaluate simple communication and control systems.
- The students can generally map typical problems to their basic knowledge, find suitable solution methods and implement them. They can appropriately document the chosen solution in writing and present it to an audience in a clearly structured manner.

#### Social competence

- Students are able to present the procedure and results of their work in a comprehensible manner, both orally and in writing.
- The students are able to communicate about the contents and problems of electrical engineering with experts and laypersons. They can react appropriately to questions, additions and comments.
- The students are able to work in groups. They can define, distribute and integrate subtasks. They can make time arrangements and interact socially.

#### Competence to work independently

## Module Manual B.Sc. "Electrical Engineering"

- The students are able to obtain necessary technical information and place it in the context of their knowledge
- The students can realistically assess their existing competences and work on deficits independently
- The students can learn complex topics and work on problems in a self-organised and self-motivated manner (lifelong learning).

### **Program structure**

The curriculum of the Bachelor's degree programme in Electrical Engineering is structured as follows:

- Core qualification - compulsory: 24 modules, 144 credit points (LP), 1st - 6th semester.
- Core qualification - compulsory elective: 4 modules, 24 LP, 4th, 5th and 6th semester
- Bachelor thesis: 12 LP, 6th semester

The total workload for the Bachelor's programme is 180 LP, with a semester distribution of 30/28/32/30/30/30 LP.

In addition to the subject modules, the core qualification also includes the following interdisciplinary modules:

- Fundamentals of business administration: 6 LP, 1st semester
- Non-technical supplementary courses in the Bachelor: 6 LP, 1st - 6th semester

**Core Qualification**

| Module M0577: Non-technical Courses for Bachelors |  |
|---|--|
| <b>Module Responsible</b>                         | Dagmar Richter   |
| <b>Admission Requirements</b>                     | None   |
| <b>Recommended Previous Knowledge</b>             | None   |
| <b>Educational Objectives</b>                     | After taking part successfully, students have reached the following learning results   |
| <b>Professional Competence</b>                    | <p><i>Knowledge</i></p> <p><b>The Non-technical Academic Programms (NTA)</b></p> <p>imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its <b>teaching architecture</b>, in its <b>teaching and learning arrangements</b>, in <b>teaching areas</b> and by means of teaching offerings in which students can qualify by opting for <b>specific competences</b> and a <b>competence level</b> at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.</p> <p><b>The Learning Architecture</b></p> <p>consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.</p> <p>The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles"</p> <p>The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.</p> <p><b>Teaching and Learning Arrangements</b></p> <p>provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.</p> <p><b>Fields of Teaching</b></p> <p>are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.</p> <p>The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.</p> <p><b>The Competence Level</b></p> <p>of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.</p> <p>This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.</p> <p><b>Specialized Competence (Knowledge)</b></p> <p>Students can</p> <ul style="list-style-type: none"> <li>• locate selected specialized areas with the relevant non-technical mother discipline,</li> <li>• outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,</li> <li>• different specialist disciplines relate to their own discipline and differentiate it as well as make connections,</li> <li>• sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,</li> <li>• Can communicate in a foreign language in a manner appropriate to the subject.</li> </ul> <p><i>Skills</i></p> <p><b>Professional Competence (Skills)</b></p> <p>In selected sub-areas students can</p> <ul style="list-style-type: none"> <li>• apply basic methods of the said scientific disciplines,</li> <li>• question a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,</li> <li>• to handle simple questions in aforementioned scientific disciplines in a successful manner,</li> <li>• justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.</li> </ul> <p><b>Personal Competence</b></p> |

|                          |   |
|--------------------------|---|
| <i>Social Competence</i> | <p><b>Personal Competences (Social Skills)</b></p> <p>Students will be able</p> <ul style="list-style-type: none"> <li>• to learn to collaborate in different manner,</li> <li>• to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,</li> <li>• to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),</li> <li>• to explain nontechnical items to auditorium with technical background knowledge.</li> </ul>                  |
| <i>Autonomy</i>          | <p><b>Personal Competences (Self-reliance)</b></p> <p>Students are able in selected areas</p> <ul style="list-style-type: none"> <li>• to reflect on their own profession and professionalism in the context of real-life fields of application</li> <li>• to organize themselves and their own learning processes</li> <li>• to reflect and decide questions in front of a broad education background</li> <li>• to communicate a nontechnical item in a competent way in written form or verbally</li> <li>• to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)</li> </ul> |
| <b>Workload in Hours</b> | Depends on choice of courses  |
| <b>Credit points</b>     | 6   |

| <b>Content</b>                          | <p>In the physics lab a number of key experiments on physical phenomena in mechanics, oscillatory and wave motion, thermodynamics, electricity, and optics will be conducted by the students under assistance of a lecturing tutor. The experiments are part of the physics education program presented in the course "Physics for TUHH-ET Engineers".</p> <p>Beyond teaching of fundamental physical background the objectives are basic skills in preparation and performing physical measurements, usage of physical equipment, analysis of the results and preparation of a report on the experimental data.</p> |
| <b>Literature</b>                       | <p>Zu den Versuchen gibt es individuelle Versuchsanleitungen, die vor der Versuchsdurchführung ausgegeben werden.</p> <p>Zum Teil müssen die zur Versuchsdurchführung notwendigen physikalischen Hintergründe selbstständig erarbeitet werden, wozu die zur Vorlesung "Physik für TUHH-ET Ingenieure" angegebene Literatur gut geeignet ist.</p>   |

| <b>Lecturer</b>                   | Prof. Christoph Ihl, Katharina Roedelius   |
| <b>Language</b>                   | DE   |
| <b>Cycle</b>                      | WiSe/SoSe  |
| <b>Content</b>                    | <p>In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.</p> <p>If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the business knowledge from the lecture should come to practical use. The group projects are guided by a mentor.</p> |

| <b>Recommended Previous Knowledge</b>   | Electrical Engineering I<br>Mathematics I<br>Direct current networks, complex numbers  |                            |               |                    |
| <b>Educational Objectives</b>   | After taking part successfully, students have reached the following learning results   |                            |               |                    |
| <b>Professional Competence</b>  | <p><i>Knowledge</i> Students are able to reproduce and explain fundamental theories, principles, and methods related to the theory of alternating currents. They can describe networks of linear elements using a complex notation for voltages and currents. They can reproduce an overview of applications for the theory of alternating currents in the area of electrical engineering. Students are capable of explaining the behavior of fundamental passive and active devices as well as their impact on simple circuits.</p> <p><i>Skills</i> Students are capable of calculating parameters within simple electrical networks at alternating currents by means of a complex notation for voltages and currents. They can appraise the fundamental effects that may occur within electrical networks at alternating currents. Students are able to analyze simple circuits such as oscillating circuits, filter, and matching networks quantitatively and dimension elements by means of a design. They can motivate and justify the fundamental elements of an electrical power supply (transformer, transmission line, compensation of reactive power, multiphase system) and are qualified to dimension their main features.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> Students are able to work together on subject related tasks in small groups. They are able to present their results effectively.</p> <p><i>Autonomy</i> Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as online-tests and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of other lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).</p> |                            |               |                    |

| <b>Admission Requirements</b>                           | None  |                            |               |                    |
| <b>Recommended Previous Knowledge</b>                   | principles of mathematics<br>principles of electrical engineering   |                            |               |                    |
| <b>Educational Objectives</b>                           | After taking part successfully, students have reached the following learning results  |                            |               |                    |
| <b>Professional Competence</b>                          |   |                            |               |                    |
| <i>Knowledge</i>  | The students are able to explain the purpose of metrology and the acquisition and processing of measurements. They can detail aspects of probability theory and errors, and explain the processing of stochastic signals. Students know methods to digitalize and describe measured signals.  |                            |               |                    |
| <i>Skills</i>   | The students are able to evaluate problems of metrology and to apply methods for describing and processing of measurements.   |                            |               |                    |
| <b>Personal Competence</b>                              |   |                            |               |                    |
| <i>Social Competence</i>                                | The students solve problems in small groups.  |                            |               |                    |
| <i>Autonomy</i>   | The students can reflect their knowledge and discuss and evaluate their results.  |                            |               |                    |

| Module M0708: Electrical Engineering III: Circuit Theory and Transients |  |        |    |
|---|--|--------|----|
| Courses   |  |        |    |
| Title   | Typ  | Hrs/wk | CP |
| Circuit Theory (L0566)  | Lecture  | 3      | 4  |
| Circuit Theory (L0567)  | Recitation Section (small)   | 2      | 2  |
| <b>Module Responsible</b>   | Prof. Alexander Kölpin   |        |    |
| <b>Admission Requirements</b>   | None   |        |    |
| <b>Recommended Previous Knowledge</b>                                   | Electrical Engineering I and II, Mathematics I and II  |        |    |
| <b>Educational Objectives</b>   | After taking part successfully, students have reached the following learning results   |        |    |
| <b>Professional Competence</b>  |  |        |    |
| <i>Knowledge</i>  | Students are able to explain the basic methods for calculating electrical circuits. They know the Fourier series analysis of linear networks driven by periodic signals. They know the methods for transient analysis of linear networks in time and in frequency domain, and they are able to explain the frequency behaviour and the synthesis of passive two-terminal-circuits.   |        |    |
| <i>Skills</i>   | The students are able to calculate currents and voltages in linear networks by means of basic methods, also when driven by periodic signals. They are able to calculate transients in electrical circuits in time and frequency domain and are able to explain the respective transient behaviour. They are able to analyse and to synthesize the frequency behaviour of passive two-terminal-circuits.  |        |    |
| <b>Personal Competence</b>  |  |        |    |
| <i>Social Competence</i>  | Students work on exercise tasks in small guided groups. They are encouraged to present and discuss their results within the group.   |        |    |
| <i>Autonomy</i>   | The students are able to find out the required methods for solving the given practice problems. Possibilities are given to test their knowledge during the lectures continuously by means of short-time tests. This allows them to control independently their educational objectives. They can link their gained knowledge to other courses like Electrical Engineering I and Mathematics I.  |        |    |
| <b>Workload in Hours</b>  | Independent Study Time 110, Study Time in Lecture 70   |        |    |

| <b>Recommended Previous Knowledge</b>         | Basic knowledge in electrical engineering  |                            |               |                    |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |                            |               |                    |
| <b>Professional Competence</b>                | <p><i>Knowledge</i></p> <p>This module deals with the foundations of the functionality of computing systems. It covers the layers from the assembly-level programming down to gates. The module includes the following topics:</p> <ul style="list-style-type: none"> <li>• Introduction</li> <li>• Combinational logic: Gates, Boolean algebra, Boolean functions, hardware synthesis, combinational networks</li> <li>• Sequential logic: Flip-flops, automata, systematic hardware design</li> <li>• Technological foundations</li> <li>• Computer arithmetic: Integer addition, subtraction, multiplication and division</li> <li>• Basics of computer architecture: Programming models, MIPS single-cycle architecture, pipelining</li> <li>• Memories: Memory hierarchies, SRAM, DRAM, caches</li> <li>• Input/output: I/O from the perspective of the CPU, principles of passing data, point-to-point connections, busses</li> </ul> <p><i>Skills</i></p> <p>The students perceive computer systems from the architect's perspective, i.e., they identify the internal structure and the physical composition of computer systems. The students can analyze, how highly specific and individual computers can be built based on a collection of few and simple components. They are able to distinguish between and to explain the different abstraction layers of today's computing systems - from gates and circuits up to complete processors.</p> <p>After successful completion of the module, the students are able to judge the interdependencies between a physical computer system and the software executed on it. In particular, they shall understand the consequences that the execution of software has on the hardware-centric abstraction layers from the assembly language down to gates. This way, they will be enabled to evaluate the impact that these low abstraction levels have on an entire system's performance and to propose feasible options.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i></p> <p>Students are able to solve similar problems alone or in a group and to present the results accordingly.</p> <p><i>Autonomy</i></p> <p>Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.</p> |                            |               |                    |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56   |                            |               |                    |
| <b>Credit points</b>                          | 6  |                            |               |                    |
| <b>Course achievement</b>                     | <b>Compulsory</b>  | <b>Bonus</b>               | <b>Form</b>   | <b>Description</b> |

| Theoretical Electrical Engineering I: Time-Independent Fields (L0181)       |   | Recitation Section (small) | 2             |
| <b>Module Responsible</b>   | Prof. Christian Schuster  |                            |               |
| <b>Admission Requirements</b>   | None  |                            |               |
| <b>Recommended Previous Knowledge</b>                                       | Basic principles of electrical engineering and advanced mathematics   |                            |               |
| <b>Educational Objectives</b>   | After taking part successfully, students have reached the following learning results  |                            |               |
| <b>Professional Competence</b>  |   |                            |               |
| <i>Knowledge</i>  | Students can explain the fundamental formulas, relations, and methods of the theory of time-independent electromagnetic fields. They can explicate the principal behavior of electrostatic, magnetostatic, and current density fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-independent electromagnetic fields and are able to explicate these.   |                            |               |
| <i>Skills</i>   | Students can apply Maxwell's Equations in integral notation in order to solve highly symmetrical, time-independent, electromagnetic field problems. Furthermore, they are capable of applying a variety of methods that require solving Maxwell's Equations for more general problems. The students can assess the principal effects of given time-independent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of electrostatic, magnetostatic, and electrical flow fields (capacitances, inductances, resistances, etc.) from given fields and dimension them for practical applications. |                            |               |
| <b>Personal Competence</b>  |   |                            |               |
| <i>Social Competence</i>  | Students are able to work together on subject related tasks in small groups. They are able to present their results effectively (e.g. during exercise sessions).  |                            |               |
| <i>Autonomy</i>   | Students are capable to gather necessary information from provided references and relate this information to the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of other lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).   |                            |               |
| <b>Workload in Hours</b>  | Independent Study Time 110, Study Time in Lecture 70  |                            |               |
| <b>Credit points</b>  | 6   |                            |               |
| <b>Course achievement</b>   | None  |                            |               |
| <b>Examination</b>  | Written exam  |                            |               |
| <b>Examination duration and scale</b>                                       | 90-150 minutes  |                            |               |

| Signals and Systems (L0432)                   |  | Lecture                    | 3             |
| Signals and Systems (L0433)                   |  | Recitation Section (small) | 2             |
| <b>Module Responsible</b>                     | Prof. Gerhard Bauch  |                            |               |
| <b>Admission Requirements</b>                 | None   |                            |               |
| <b>Recommended Previous Knowledge</b>         | Mathematics 1-3  |                            |               |
|   | The modul is an introduction to the theory of signals and systems. Good knowledge in maths as covered by the moduls Mathematik 1-3 is expected. Further experience with spectral transformations (Fourier series, Fourier transform, Laplace transform) is useful but not required.  |                            |               |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |                            |               |
| <b>Professional Competence</b>                | <p><i>Knowledge</i> The students are able to classify and describe signals and linear time-invariant (LTI) systems using methods of signal and system theory. They are able to apply the fundamental transformations of continuous-time and discrete-time signals and systems. They can describe and analyse deterministic signals and systems mathematically in both time and image domain. In particular, they understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a discrete-time signal.</p> <p>The students are familiar with the contents of lecture and tutorials. They can explain and apply them to new problems.</p> <p><i>Skills</i> The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and system theory. They can analyse and design basic systems regarding important properties such as magnitude and phase response, stability, linearity etc.. They can assess the impact of LTI systems on the signal properties in time and frequency domain.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> The students can jointly solve specific problems.</p> <p><i>Autonomy</i> The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.</p> |                            |               |
| <b>Workload in Hours</b>                      | Independent Study Time 110, Study Time in Lecture 70   |                            |               |
| <b>Credit points</b>                          | 6  |                            |               |
| <b>Course achievement</b>                     | None   |                            |               |
| <b>Examination</b>                            | Written exam   |                            |               |
| <b>Examination duration and scale</b>         | 90 min   |                            |               |

| Electrical Engineering Project Laboratory (L0640)              | Project-/problem-based Learning   | 8             | 6         |
| <b>Module Responsible</b>                                      | Prof. Christian Becker  |               |           |
| <b>Admission Requirements</b>                                  | None  |               |           |
| <b>Recommended Previous Knowledge</b>                          | Electrical Engineering I, Electrical Engineering II   |               |           |
| <b>Educational Objectives</b>                                  | After taking part successfully, students have reached the following learning results  |               |           |
| <b>Professional Competence</b>                                 | <p><i>Knowledge</i> Students are able to give a summary of the technical details of projects in the area of electrical engineering and illustrate respective relationships. They are capable of describing and communicating relevant problems and questions using appropriate technical language. They can explain the typical process of solving practical problems and present related results.</p> <p><i>Skills</i> The students can transfer their fundamental knowledge on electrical engineering to the process of solving practical problems. They identify and overcome typical problems during the realization of projects in the context of electrical engineering. Students are able to develop, compare, and choose conceptual solutions for non-standardized problems.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> Students are able to cooperate in small, mixed-subject groups in order to independently derive solutions to given problems in the context of electrical engineering. They are able to effectively present and explain their results alone or in groups in front of a qualified audience. Students have the ability to develop alternative approaches to an electrical engineering problem independently or in groups and discuss advantages as well as drawbacks.</p> <p><i>Autonomy</i> Students are capable of independently solving electrical engineering problems using provided literature. They are able to fill gaps in as well as extend their knowledge using the literature and other sources provided by the supervisor. Furthermore, they can meaningfully extend given problems and pragmatically solve them by means of corresponding solutions and concepts.</p> |               |           |

| <b>Language</b>  | DE   |
| <b>Cycle</b>   | SoSe   |
| <b>Content</b>   | Topics and projects cover the entire field of applications of electrical engineering. Typically, the students will prototype functional units and self-contained systems, such as radar devices, networks of sensors, amateur radio transceiver, power electronics based inverters, discrete computers, or atomic force microscopes. Different projects are devised on a yearly basis. |
| <b>Literature</b>  | Alle zur Durchführung der Projekte sinnvollen Quellen (Skripte, Fachbücher, Manuals, Datenblätter, Internetseiten). / All sources that are useful for completion of the projects (lecture notes, textbooks, manuals, data sheets, internet pages).   |

| <b>Recommended Previous Knowledge</b>   | Basic principles of physics and electrical engineering  |                            |               |           |
| <b>Educational Objectives</b>   | After taking part successfully, students have reached the following learning results  |                            |               |           |
| <b>Professional Competence</b>  |   |                            |               |           |
| <i>Knowledge</i>  | Students can explain the basic principles, relationships, and methods for the design of waveguides and antennas as well as of Electromagnetic Compatibility. Specific topics are: <ul style="list-style-type: none"> <li>- Fundamental properties and phenomena of electrical circuits</li> <li>- Steady-state sinusoidal analysis of electrical circuits</li> <li>- Fundamental properties and phenomena of electromagnetic fields and waves</li> <li>- Steady-state sinusoidal description of electromagnetic fields and waves</li> <li>- Useful microwave network parameters</li> <li>- Transmission lines and basic results from transmission line theory</li> <li>- Plane wave propagation, superposition, reflection and refraction</li> <li>- General theory of waveguides</li> <li>- Most important types of waveguides and their properties</li> <li>- Radiation and basic antenna parameters</li> <li>- Most important types of antennas and their properties</li> <li>- Numerical techniques and CAD tools for waveguide and antenna design</li> <li>- Fundamentals of Electromagnetic Compatibility</li> <li>- Coupling mechanisms and countermeasures</li> <li>- Shielding, grounding, filtering</li> <li>- Standards and regulations</li> <li>- EMC measurement techniques</li> </ul> |                            |               |           |
| <i>Skills</i>   | Students know how to apply various methods and models for characterization and choice of waveguides and antennas. They are able to assess and qualify their basic electromagnetic properties. They can apply results and strategies from the field of Electromagnetic Compatibility to the development of electrical components and systems.  |                            |               |           |
| <b>Personal Competence</b>  |   |                            |               |           |
| <i>Social Competence</i>  | Students are able to work together on subject related tasks in small groups. They are able to present their results effectively in English (e.g. during small group exercises).   |                            |               |           |
| <i>Autonomy</i>   | Students are capable to gather information from subject related, professional publications and relate that information to the context of the lecture. They are able to make a connection between their knowledge obtained in this lecture with the content of other lectures (e.g. theory of electromagnetic fields, fundamentals of electrical engineering / physics). They can discuss technical problems and physical effects in English.  |                            |               |           |
| <b>Workload in Hours</b>  | Independent Study Time 110, Study Time in Lecture 70  |                            |               |           |
| <b>Credit points</b>  | 6   |                            |               |           |
| <b>Course achievement</b>   | None  |                            |               |           |
| <b>Examination</b>  | Oral exam   |                            |               |           |

| <b>Content</b>  | <p>This course is intended as an introduction to the topics of wave propagation, guiding, sending, and receiving as well as Electromagnetic Compatibility (EMC). It will be useful for engineers that face the technical challenge of transmitting high frequency / high bandwidth data in e.g. medical, automotive, or avionic applications. Both circuit and field concepts of wave propagation and Electromagnetic Compatibility will be introduced and discussed.</p> <p>Topics:</p> <ul style="list-style-type: none"> <li>- Fundamental properties and phenomena of electrical circuits</li> <li>- Steady-state sinusoidal analysis of electrical circuits</li> <li>- Fundamental properties and phenomena of electromagnetic fields and waves</li> <li>- Steady-state sinusoidal description of electromagnetic fields and waves</li> <li>- Useful microwave network parameters</li> <li>- Transmission lines and basic results from transmission line theory</li> <li>- Plane wave propagation, superposition, reflection and refraction</li> <li>- General theory of waveguides</li> <li>- Most important types of waveguides and their properties</li> <li>- Radiation and basic antenna parameters</li> <li>- Most important types of antennas and their properties</li> <li>- Numerical techniques and CAD tools for waveguide and antenna design</li> <li>- Fundamentals of Electromagnetic Compatibility</li> <li>- Coupling mechanisms and countermeasures</li> <li>- Shielding, grounding, filtering</li> <li>- Standards and regulations</li> <li>- EMC measurement techniques</li> </ul> |

| <b>Admission Requirements</b>                              | None  |                                 |               |
| <b>Recommended Previous Knowledge</b>                      | <ul style="list-style-type: none"> <li>• Electrical engineering / Fundamentals of electrical engineering</li> <li>• Computer science / Computer science for engineers</li> </ul>  |                                 |               |
| <b>Educational Objectives</b>                              | After taking part successfully, students have reached the following learning results  |                                 |               |
| <b>Professional Competence</b>                             | <p><i>Knowledge</i></p> <ul style="list-style-type: none"> <li>• Fundamentals of space electronics,</li> <li>• Subcomponents of satellite systems</li> <li>• Fragmentation and planning of primary missions</li> <li>• Active participation in CubeSat mission to apply learned skills</li> <li>• Soft skills in project management, project planning and project communication</li> </ul> <p><i>Skills</i></p> <p>Upon completion of the module, students will have learned fundamentals of space electronics. They also know how to plan primary missions and how to define subsystems to achieve this primary mission (requirements analysis, performance specification). They will be actively involved in missions and will be expected to put what they have learned into practice there. Additional soft skills in the area of general project management will be taught and applied through collaboration with the students.</p> <ul style="list-style-type: none"> <li>• Basic teaching</li> <li>• Conceptual design of subsystems (description of requirements and services)</li> <li>• Project planning and fragmentation of primary missions (space missions)</li> <li>• Practical application in CubeSat mission</li> </ul> <p><b>Personal Competence</b></p> <p><i>Social Competence</i></p> <p>The work takes place alternately in the entire group, but also in small groups. This requires close cooperation and coordination within the individual teams. The goal is for students to gain a sound knowledge of space electronics and space missions on the one hand, to apply this knowledge on the other hand and to generate sustainability of their results by working in small groups. This can be, for example, the passing on of the requirement and performance specifications, which act as a basis, starting point and result across semesters.</p> <p><i>Autonomy</i></p> <p>After completing the module, students will be able to independently plan and carry out scientific projects and processes. In group work, organization, idea generation, derivation of hypotheses and thought processes are to be independently moderated and carried out.</p> |                                 |               |

| Module M1235: Electrical Power Systems I: Introduction to Electrical Power Systems |   |        |    |
|--|---|--------|----|
| Courses  |   |        |    |
| Title  | Typ   | Hrs/wk | CP |
| Electrical Power Systems I: Introduction to Electrical Power Systems (L1670)       | Lecture   | 3      | 4  |
| Electrical Power Systems I: Introduction to Electrical Power Systems (L1671)       | Recitation Section (small)  | 2      | 2  |
| <b>Module Responsible</b>  | Prof. Christian Becker  |        |    |
| <b>Admission Requirements</b>  | None  |        |    |
| <b>Recommended Previous Knowledge</b>  | Fundamentals of Electrical Engineering  |        |    |
| <b>Educational Objectives</b>  | After taking part successfully, students have reached the following learning results  |        |    |
| <b>Professional Competence</b>   | <p><i>Knowledge</i> Students are able to give an overview of conventional and modern electric power systems. They can explain in detail and critically evaluate technologies of electric power generation, transmission, storage, and distribution as well as integration of equipment into electric power systems.</p> <p><i>Skills</i> With completion of this module the students are able to apply the acquired skills in applications of the design, integration, development of electric power systems and to assess the results.</p>   |        |    |
| <b>Personal Competence</b>   | <p><i>Social Competence</i> The students can participate in specialized and interdisciplinary discussions, advance ideas and represent their own work results in front of others.</p> <p><i>Autonomy</i> Students can independently tap knowledge of the emphasis of the lectures.</p>  |        |    |
| <b>Workload in Hours</b>   | Independent Study Time 110, Study Time in Lecture 70  |        |    |
| <b>Credit points</b>   | 6   |        |    |
| <b>Course achievement</b>  | None  |        |    |
| <b>Examination</b>   | Written exam  |        |    |
| <b>Examination duration and scale</b>  | 90 - 150 minutes  |        |    |
| <b>Assignment for the Following Curricula</b>                                      | General Engineering Science (German program, 7 semester): Specialisation Electrical Engineering: Elective Compulsory<br>General Engineering Science (German program, 7 semester): Specialisation Green Technologies, Focus Renewable Energy: Elective Compulsory<br>General Engineering Science (German program, 7 semester): Specialisation Mechanical Engineering, Focus Energy Systems: Elective Compulsory<br>Electrical Engineering: Core Qualification: Elective Compulsory<br>Energy Systems: Specialisation Energy Systems: Elective Compulsory<br>Engineering Science: Specialisation Electrical Engineering: Elective Compulsory<br>Green Technologies: Energy, Water, Climate: Specialisation Energy Systems / Renewable Energies: Elective Compulsory<br>Computer Science in Engineering: Specialisation II. | Theoretical Electrical Engineering II: Time-Dependent Fields (L0183)       | Recitation Section (small)  | 2      | 1  |
| <b>Module Responsible</b>  | Prof. Christian Schuster  |        |    |
| <b>Admission Requirements</b>  | None  |        |    |
| <b>Recommended Previous Knowledge</b>                                      | Electrical Engineering I, Electrical Engineering II, Theoretical Electrical Engineering I<br>Mathematics I, Mathematics II, Mathematics III, Mathematics IV   |        |    |
| <b>Educational Objectives</b>  | After taking part successfully, students have reached the following learning results  |        |    |
| <b>Professional Competence</b>   | <p><i>Knowledge</i> Students are able to explain fundamental formulas, relations, and methods related to the theory of time-dependent electromagnetic fields. They can assess the principal behavior and characteristics of quasistationary and fully dynamic fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-dependent electromagnetic fields and are able to explicate these.</p> <p><i>Skills</i> Students are able to apply a variety of procedures in order to solve the diffusion and the wave equation for general time-dependent field problems. They can assess the principal effects of given time-dependent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of fully dynamic fields (wave impedance, skin depth, Poynting-vector, radiation resistance, etc.) from given fields and interpret them with regard to practical applications.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> Students are able to work together on subject related tasks in small groups. They are able to present their results effectively (e.g. during exercise sessions).</p> <p><i>Autonomy</i> Students are capable to gather necessary information from provided references and relate this information to the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between acquired knowledge and ongoing research at the Hamburg University of Technology (TUHH), e.g. in the area of high frequency engineering and optics.</p> |        |    |

| Introduction to Communications and Random Processes (L0443)       |   | Recitation Section (large) | 1             |
| Introduction to Communications and Random Processes (L2354)       |   | Recitation Section (small) | 1             |
| <b>Module Responsible</b>   | Prof. Gerhard Bauch   |                            |               |
| <b>Admission Requirements</b>                                     | None  |                            |               |
| <b>Recommended Previous Knowledge</b>                             | <ul style="list-style-type: none"> <li>• Mathematics 1-3</li> <li>• Signals and Systems</li> </ul>  |                            |               |
| <b>Educational Objectives</b>                                     | After taking part successfully, students have reached the following learning results  |                            |               |
| <b>Professional Competence</b>                                    |   |                            |               |
| <i>Knowledge</i>  | The students know and understand the fundamental building blocks of a communications system. They can describe and analyse the individual building blocks using knowledge of signal and system theory as well as the theory of stochastic processes. The are aware of the essential resources and evaluation criteria of information transmission and are able to design and evaluate a basic communications system.  |                            |               |
|   | The students are familiar with the contents of lecture and tutorials. They can explain and apply them to new problems.  |                            |               |
| <i>Skills</i>   | The students are able to design and evaluate a basic communications system. In particular, they can estimate the required resources in terms of bandwidth and power. They are able to assess essential evaluation parameters of a basic communications system such as bandwidth efficiency or bit error rate and to decide for a suitable transmission method.  |                            |               |
| <b>Personal Competence</b>  |   |                            |               |
| <i>Social Competence</i>  | The students can jointly solve specific problems.   |                            |               |
| <i>Autonomy</i>   | The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.  |                            |               |
| <b>Workload in Hours</b>  | Independent Study Time 110, Study Time in Lecture 70  |                            |               |
| <b>Credit points</b>  | 6   |                            |               |
| <b>Course achievement</b>   | None  |                            |               |
| <b>Examination</b>  | Written exam  |                            |               |
| <b>Examination duration and scale</b>                             | 90 min  |                            |               |

- Continuous and discrete random variables
  - Probability density function (pdf), cumulative distribution function (cdf)
  - Expected value, mean, median, quadratic mean, variance, standard deviation, higher moments
  - Examples for probability distributions (Bernoulli distribution, two-point distribution, uniform distribution, Gaussian (normal) distribution, Rayleigh distribution, etc.)
- Multiple random variables
  - Conditional probability, joint probability
  - Conditional and joint probability density function
  - Bayes' rule
  - Correlation coefficient
  - Two-dimensional Gaussian distribution
  - Statistically independent, uncorrelated and orthogonal random variables
  - Independent identically distributed (iid) random variables
  - Properties of expected value and variance
  - Covariance
  - Probability density function (pdf) and cumulative distribution function (cdf) of the sum of statistically independent random variables
  - Central limit theorem
- Probability density functions (pdfs) in data transmission
- Continuous-time and discrete-time random processes
  - Examples for random processes
  - Ensemble average and time average
  - Ergodic random processes
  - Quadratic mean and variance
  - Probability density function (pdf) and cumulative distribution function (cdf)
  - Joint probability density function (pdf) and joint cumulative distribution function (cdf)
  - Statistically independent, uncorrelated and orthogonal random processes
  - Stationary random processes
  - Correlation functions: Autocorrelation function, crosscorrelation function, average autocorrelation function of non-stationary random processes, autocorrelation and crosscorrelation function of stationary processes, autocovariance function, crosscovariance function
  - Autocorrelation matrix, crosscorrelation matrix, autocovariance matrix, crosscovariance matrix
  - Pseudo-noise sequences, example: Code division multiple access (CDMA)
  - Autocorrelation function, power spectral density (psd), signal power, Einstein-Wiener-Khinchine relations
  - White (Gaussian) noise
- Filtering of random processes by LTI systems
  - Transformation of the probability density function (pdf)
  - Transformation of the mean
  - Transformation of the power spectral density (psd)
  - Correlation functions of input and output signal
  - Filtering of white Gaussian noise
  - Bandlimitation for noise power limitation
  - Preemphasis and deemphasis
- Companding,  $\mu$ -law, A-law
- Functions of random variables
  - Transformation of probabilities and of the probability density function (pdf)
  - Application: Non-linear amplifiers
- Functions of two random variables
  - Probability density function
  - Examples: Rayleigh distribution, magnitude of an OFDM signal, magnitude of a received radio signal
- Transmission channels and channel models
  - Wireline channels: Telephone cable, coaxial cable, optical fiber
  - Wireless channels: Fading radio channel, underwater channels
  - Frequency-flat and frequency-selective channels
  - Additive white Gaussian noise (AWGN) channel
  - Signal to noise power ratio (SNR)
  - Discrete-time channel models
  - Discrete memoryless channels (DMC)
- Analog-to-digital conversion
  - Sampling
    - Sampling theorem
  - Pulse modulation
    - Pulse-amplitude modulation (PAM)
    - Pulse-duration modulation (PDM), pulse-width modulation (PWM)
    - Pulse-position modulation (PPM)
    - Pulse-code modulation (PCM)
  - Quantization
    - Linear quantization, midtread and midrise characteristic
    - Quantization error, quantization noise
    - Signal-to-quantization noise ratio
    - Non-linear quantization, compressor characteristics,  $\mu$ -law, A-law
    - Speech transmission with PCM
  - Differential pulse-code modulation (DPCM)
    - Linear prediction according to the minimum mean squared error (MMSE) criterion.
    - DPCM with forward prediction and backward prediction

| Introduction into Medical Technology and Systems (L0342)       |   | Lecture                    | 2                  3           |
| Introduction into Medical Technology and Systems (L0343)       |   | Project Seminar            | 2                  2           |
| Introduction into Medical Technology and Systems (L1876)       |   | Recitation Section (large) | 1                  1           |
| <b>Module Responsible</b>                                      | Prof. Alexander Schlaefer   |                            |                                |
| <b>Admission Requirements</b>                                  | None  |                            |                                |
| <b>Recommended Previous Knowledge</b>                          | principles of math (algebra, analysis/calculus)<br>principles of stochastics<br>principles of programming, R/Matlab   |                            |                                |
| <b>Educational Objectives</b>                                  | After taking part successfully, students have reached the following learning results  |                            |                                |
| <b>Professional Competence</b>                                 |   |                            |                                |
| <i>Knowledge</i>   | The students can explain principles of medical technology, including imaging systems, computer aided surgery, and medical information systems. They are able to give an overview of regulatory affairs and standards in medical technology.   |                            |                                |
| <i>Skills</i>  | The students are able to evaluate systems and medical devices in the context of clinical applications.  |                            |                                |
| <b>Personal Competence</b>                                     |   |                            |                                |
| <i>Social Competence</i>                                       | The students describe a problem in medical technology as a project, and define tasks that are solved in a joint effort.<br>The students can critically reflect on the results of other groups and make constructive suggestions for improvement.  |                            |                                |
| <i>Autonomy</i>  | The students can assess their level of knowledge and document their work results. They can critically evaluate the results achieved and present them in an appropriate manner.  |                            |                                |
| <b>Workload in Hours</b>                                       | Independent Study Time 110, Study Time in Lecture 70  |                            |                                |

| Embedded Systems (L0806)                      |  | Recitation Section (small)      | 1             | 2                              |
| <b>Module Responsible</b>                     | Prof. Heiko Falk   |                                 |               |                                |
| <b>Admission Requirements</b>                 | None   |                                 |               |                                |
| <b>Recommended Previous Knowledge</b>         | Computer Engineering   |                                 |               |                                |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |                                 |               |                                |
| <b>Professional Competence</b>                | <p><i>Knowledge</i> Embedded systems can be defined as information processing systems embedded into enclosing products. This course teaches the foundations of such systems. In particular, it deals with an introduction into these systems (notions, common characteristics) and their specification languages (models of computation, hierarchical automata, specification of distributed systems, task graphs, specification of real-time applications, translations between different models).</p> <p>Another part covers the hardware of embedded systems: Sensors, A/D and D/A converters, real-time capable communication hardware, embedded processors, memories, energy dissipation, reconfigurable logic and actuators. The course also features an introduction into real-time operating systems, middleware and real-time scheduling. Finally, the implementation of embedded systems using hardware/software co-design (hardware/software partitioning, high-level transformations of specifications, energy-efficient realizations, compilers for embedded processors) is covered.</p> <p><i>Skills</i> After having attended the course, students shall be able to realize simple embedded systems. The students shall realize which relevant parts of technological competences to use in order to obtain a functional embedded systems. In particular, they shall be able to compare different models of computations and feasible techniques for system-level design. They shall be able to judge in which areas of embedded system design specific risks exist.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> Students are able to solve similar problems alone or in a group and to present the results accordingly.</p> <p><i>Autonomy</i> Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.</p> |                                 |               |                                |
| <b>Workload in Hours</b>                      | Independent Study Time 110, Study Time in Lecture 70   |                                 |               |                                |
| <b>Credit points</b>                          | 6  |                                 |               |                                |
| <b>Course achievement</b>                     | <b>Compulsory</b>  | <b>Bonus</b>                    | <b>Form</b>   | <b>Description</b>             |

## Thesis

### Module M-001: Bachelor Thesis

#### Courses

| Title  | Typ  | Hrs/wk | CP |
|--|--|--------|----|
| <b>Module Responsible</b>                              | Professoren der TUHH   |        |    |
| <b>Admission Requirements</b>                          | <ul style="list-style-type: none"> <li>According to General Regulations §21 (1):<br/>At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.</li> </ul>  |        |    |
| <b>Recommended Previous Knowledge</b>                  |  |        |    |
| <b>Educational Objectives</b>                          | After taking part successfully, students have reached the following learning results   |        |    |
| <b>Professional Competence</b><br><i>Knowledge</i>     | <ul style="list-style-type: none"> <li>The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods).</li> <li>On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise.</li> <li>The students are able to outline the state of research on a selected issue in their subject area.</li> </ul>   |        |    |
| <b>Skills</b>  | <ul style="list-style-type: none"> <li>The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems.</li> <li>With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.</li> <li>The students can take up a critical position on the findings of their own research work from a specialized perspective.</li> </ul>   |        |    |
| <b>Personal Competence</b><br><i>Social Competence</i> | <ul style="list-style-type: none"> <li>Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way.</li> <li>The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly.</li> </ul>   |        |    |
| <i>Autonomy</i>  | <ul style="list-style-type: none"> <li>The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame.</li> <li>The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.</li> <li>The students can apply the essential techniques of scientific work to research of their own.</li> </ul>  |        |    |
| <b>Workload in Hours</b>                               | Independent Study Time 360, Study Time in Lecture 0  |        |    |
| <b>Credit points</b>                                   | 12   |        |    |
| <b>Course achievement</b>                              | None   |        |    |
| <b>Examination</b>                                     | Thesis   |        |    |
| <b>Examination duration and scale</b>                  | According to General Regulations   |        |    |
| <b>Assignment for the Following Curricula</b>          | General Engineering Science (German program): Thesis: Compulsory<br>General Engineering Science (German program, 7 semester): Thesis: Compulsory<br>Civil- and Environmental Engineering: Thesis: Compulsory<br>Bioprocess Engineering: Thesis: Compulsory<br>Chemical and Bioprocess Engineering: Thesis: Compulsory<br>Computer Science: Thesis: Compulsory<br>Data Science: Thesis: Compulsory<br>Electrical Engineering: Thesis: Compulsory<br>Engineering Science: Thesis: Compulsory<br>General Engineering Science (English program): Thesis: Compulsory<br>General Engineering Science (English program, 7 semester): Thesis: Compulsory<br>Green Technologies: Energy, Water, Climate: Thesis: Compulsory<br>Computer Science in Engineering: Thesis: Compulsory<br>Logistics and Mobility: Thesis: Compulsory<br>Mechanical Engineering: Thesis: Compulsory<br>Mechatronics: Thesis: Compulsory<br>Naval Architecture: Thesis: Compulsory<br>Technomathematics: Thesis: Compulsory<br>Teilstudiengang Lehramt Metalltechnik: Thesis: Compulsory<br>Process Engineering: Thesis: Compulsory<br>Engineering and Management - Major in Logistics and Mobility: Thesis: Compulsory |        |    |
