Module M0634. Introduction into Medical rectinology and Systems Module M0610: Electrical Machines	108
Module M0709: Electrical Machines Module M0709: Electrical Engineering IV: Transmission Lines and Research Seminar	110
Thesis	112
Module M-001: Bachelor Thesis	112

Program description

Content

Engineering disciplines directly benefit from research results in computer science and mathematics to an ever-growing extent. This holds for the development process of products as well as for the design of products themselves. New results in computer science and mathematics are a powerful driver for innovations in engineering, and therefore, computer science and mathematics are central areas of competence both for engineers and for engineering universities.

Due to new research results, engineers are enabled to build flexible systems such that the functionality provided can be automatically adapted to new requirements. It is important to understand that it is not only relevant to combine simple instructions to small programs which are to be executed fast in order to realise desired functionality. Developing systems today means that models of various kinds need to be designed, and, later on, realised by combined hardware and software components. Indeed, often hardware and software systems are even automatically generated from declarative models. Even more importantly, often on the fly reconfiguration of hard and software systems is pursued in order to fulfil flexibility requirements in practical application scenarios. In this context, a combined state-based and continuous modeling approach for system behavior becomes more and more important in a world in which hardware and software systems are tightly coupled.

It becomes clear that desired and unwanted properties of technical systems need to be automatically checked in order to fulfil security, safety, and reliability requirements. In case of a dynamic reconfiguration, satisfaction of certain properties needs to be checked also during the lifetime of a system in order to guarantee a safe and optimal mode of operation for technical systems, be this in medical or industrial application areas. In some cases, new properties or requirements first arise during a system's lifetime. Simulating physical systems it is possible to investigate and optimise certain properties before the production phase begins. On the one hand, new numerical algorithms and techniques allow for a more exact continuous behavior prediction, while, on the other hand, they can be combined with new and expressive discrete modeling techniques for future engineering products that are characterised by behavior switches. Thus, it is important to see that not only partial aspects of technical systems need to be investigated. It becomes clear that state-oriented and continuous models need to be combined in order to describe and design powerful real-world systems such as, e.g., robots or embedded systems, which are to successfully used in, for instance, medical or industrial application contexts.

The world is characterized by global information exchange. The advances started in microelectronics have influenced not only electronic data processing and software technology but have a substantial impact on all areas of everyday life. Many visions for future use of information and communication technology are just emerging. Computer science benefits form engineering science and vice versa. In order to be well prepared for the future, a combined education in computer science and engineering disciplines gives young students an excellent starting point, for research as well as for a career in industry. The study program Computational Science and Engineering systematically combines hardware and software. Given a well-founded mathematical basis, decisions about which parts of a system are best realized in hardware or software need to be based on solid knowledge in computer science and engineering sciences.

The study program Computational Science and Engineering supports this vision in all respects. Building on an integrated computer science and engineering education, students can select a specialisation in

- · Computer Science or
- Engineering

in order to finalise their studies.

In the Computer Science and Engineering Master's Program, students later can select specialisation in areas

- Systems Engineering and Robotics
- · Scientific Computing
- Reliable Embedded Systems / Cyber Physical Systems

while still be able to flexibly design their studies by choosing some modules from other study programs.

Core qualification

Module M0561: Discrete Alg	gebraic Structures			
Courses				
Title		Тур	Hrs/wk	СР
Discrete Algebraic Structures (L0164)		Lecture	2	3
Discrete Algebraic Structures (L0165)		Recitation Section (small)	2	3
Module Responsible	Prof. Karl-Heinz Zimmermann			
Admission Requirements	None.			
Recommended Previous	Mathematics from High School Diploma.			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning	results		
Professional Competence				
Knowledge	The students know the important basics of discrete algebraic structures inc	cluding elementary combinatorial struc	ctures, groups, rin	gs, and vector spaces
	They also know specific structures like sub sum-, and quotient structures a	and homomorphisms.		
Skills	Students are able to formalize and analyze basic discrete algebraic structure	***		
Skills	Students are able to formalize and analyze basic discrete algebraic structul	les.		
Personal Competence				
Social Competence	Students are able to solve specific problems alone or in a group and to pre-	sent the results accordingly.		
Autonomy				
Autonomy	•			
	•			
	•			
	Charles to an able to according to the control of t		- 40 1	
	Students are able to acquire new knowledge from specific standard books	and to associate this knowledge with t	otner classes.

Procedural Programming (L0202)		Laboratory Course	2	3
Module Responsible	Prof. Siegfried Rump			
Admission Requirements	None			
Recommended Previous	Elementary PC handling skills			
Knowledge	Elementary mathematical skills			
Educational Objectives	After taking part successfully, students have reached the foll	owing learning results		
Professional Competence	3,	3 3		
Knowledge	The students acquire the following knowledge):		
	 They know basic elements of the progra use them. 	amming language C. They know the	basic data type	s and know how to
	 They have an understanding of elemen and know how those interact. 	tary compiler tasks, of the preproces	sor and prograr	nming environment
	They know how to bind programs and ho	ow to include external libraries to ent	nance software p	oackages.
	 They know how to use header files a projects. 	and how to declare function interfa	ces to create la	arger programming
	 The acquire some knowledge how the develop programs interacting with the programs. 		ting system. Th	nis allows them to
	They learnt several possibilities how to a	model and implement frequently occi	urring standard a	algorithms.
Skills	The students know how to judge the complexity of an algorithms and how to program algorithms efficiently.		nms efficiently.	
	 The students are able to model and im they are able to adapt a given API. 	plement algorithms for a number of	standard function	onalities. Moreover,
Personal Competence Social Competence	The students acquire the following skills:			
	They are able to work in small teams to and to present their results.	solve given weekly tasks, to identif	y and analyze p	programming errors
	They are able to explain simple phenomenants.	ena to each other directly at the PC.		
	They are able to plan and to work out a part of the plan and to work out a part of the plan and to work out a part of the plan and to work out a part of the plan and to work out a plan and to work out	project in small teams.		
	They communicate final results and pres	sent programs to their tutor.		
Autonomy	 The students take individual examination and ability to solve new tasks. 	ons as well as a final written examr	n to prove their	programming skills
	 The students have many possibilities exercises. 	to check their abilities when so	lving several g	iven programming
	 In order to solve the given tasks efficie where every student solves his or her pa 		e appropriately	within their group,

Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence Knowledge	The Non-technical Elective Study Area
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-relian management, collaboration and professional and personnel management competences. The department implements these training objective teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two catalogues for nontechnical complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the "non-technical department" for specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also prientation knowledge in the form of "profiles"
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the contractions.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisci and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will hopportunity to learn about business management and start-ups in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented commuskills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are r in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Ba and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 locate selected specialized areas with the relevant non-technical mother discipline, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the spe sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
Skills	Professional Competence (Skills)
	 apply basic methods of the said scientific disciplines, auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationshi subject.
Personal Competence	

Students will be able

• to learn to collaborate in different manner,

	 to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses

Module Responsible	Prof. Rolf-Rainer Grigat		·		
Admission Requirements	Lecture Prozedurale Programmierung or equivalent pr	roficiency in imperative programming			
Recommended Previous			imilar) Vou should be	familiar with simple data	
Knowledge	Mandatory prerequisite for this lecture is proficiency in imperative programming (C, Pascal, Fortran or similar). You should be familiar with simple types (integer, double, char), arrays, if-then-else, for, while, procedure calls or function calls, pointers, and you should have used all those in your programs and therefore should be proficient with editor, compiler, linker and debugger. In this lecture we will immediately start with the introduction objects and we will not repeat the basics mentioned above. This remark is especially important for AIW, GES, LUM because those prerequisites are not part of the curriculum. They are prerequisites for the started the started in the started transfer of the started transf			ed all those in your own rt with the introduction of	
	those curricula in general. The programs ET, Cland IIV	he programs ET, CI and IIW include those prerequisites in the first semester in the lecture Prozedurale Programmierung.			
Educational Objectives	After taking part successfully, students have reached the	ne following learning results			
Professional Competence					
Knowledge	Students can explain the essentials of software design and the design of a class architecture with reference to existing class libraries and despatterns. Students can describe fundamental data structures of discrete mathematics and assess the complexity of important algorithms for sorting and searching students are able to Design software using given design patterns and applying class hierarchies and polymorphism Carry out software development and tests using version management systems and Google Test Sort and search for data efficiently Assess the complexity of algorithms.				
Skills					
Personal Competence Social Competence	Students can work in teams and communicate in forum	18.			
Autonomy	Students are able to solve programming tasks such as of two to three weeks.	s LZW data compression using SVN Repository an	d Google Test indepen	dently and over a perioc

Module M0624: Logic, Auto	omata and Formal Languages			
Courses				
Title		Тур	Hrs/wk	СР
Logic, Automata Theory and Formal Lange	uages (L0332)	Lecture	2	4
Logic, Automata Theory and Formal Lang	uages (L0507)	Recitation Section (small)	2	2
Module Responsible	Prof. Tobias Knopp			
Admission Requirements				
Recommended Previous	Participating students should be able to			
Knowledge	- specify algorithms for simple data structures (such as, e.g., array	s) to solve computational problems		
	- apply propositional logic and predicate logic for specifying and	understanding mathematical proofs		
	- apply the knowledge and skills taught in the module Discrete Al	gebraic Structures		
Educational Objectives	After taking part successfully, students have reached the following	g learning results		
Professional Competence				
Knowledge Skills	Students can explain syntax, semantics, and decision problems of propositional logic, and they are able to give algorithms for solving decision problems. Students can show correspondences to Boolean algebra. Students can describe which application problems are hard to represent with propositional logic, and therefore, the students can motivate predicate logic, and define syntax, semantics, and decision problems for this representation formalism. Students can explain unification and resolution for solving the predicate logic SAT decision problem. Students can also describe syntax, semantics, and decision problems for various kinds of temporal logic, and identify their application areas. The participants of the course can define various kinds of finite automata and can identify relationships to logic and formal grammars. The spectrum that students can explain ranges from deterministic and nondeterministic finite automata and pushdown automata to Turing machines. Students can name those formalism for which nondeterminism is more expressive than determinism. They are also able to demonstrate which decision problems require which expressivity, and, in addition, students can transform decision problems w.r.t. one formalism into decision problems w.r.t. other formalisms. They understand that some formalisms easily induce algorithms whereas others are best suited for specifying systems and their properties. Students can describe the relationships between formalisms such as logic, automata, or grammars. Students can apply propositional logic as well as predicate logic resolution to a given set of formulas. Students analyze application problems in order to derive propositional logic, predicate logic, or temporal logic formulas to represent them. They can evaluate which formalism is best suited for a particular application problem, and they can demonstrate the application of algorithms for decision problems to specific formulas. Students can also transform nondeterministic automata into deterministic ones, or derive gram

Knowledge				
Educational Objectives	After taking part successfully, students have reached the following	learning results		
Professional Competence				
Knowledge				
	Students can name further concepts in analysis and linear			
	Students can discuss logical connections between these connections between these connections.	oncepts. They are capable of illustrating	ig these connections w	ith the help of examples.
	They know proof strategies and can reproduce them.			
Skills	Ct. danta and model anablama in analysis and linear stands		ad in Abia assuma Maus	H
	Students can model problems in analysis and linear algeb	ora with the help of the concepts studi	ed in this course. More	over, tney are capable of
	solving them by applying established methods.			
	Students are able to discover and verify further logical conn	·		
	For a given problem, the students can develop and execute	e a suitable approach, and are able to	critically evaluate the re	sults.
Personal Competence				
Social Competence				
	Students are able to work together in teams. They are capable to use mathematics as a common language.			
	In doing so, they can communicate new concepts according	ng to the needs of their cooperating pa	artners. Moreover, they	can design examples to
	check and deepen the understanding of their peers.			
Autonomy				
,	 Students are capable of checking their understanding of c 	complex concepts on their own. They	can specify open ques	tions precisely and know
	where to get help in solving them.			
	Students have developed sufficient persistence to be able.	to work for longer periods in a goal-orie	ented manner on hard p	oroblems.

Content	In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs. In the second part of the lecture an introduction to Internet security is given. This class comprises: Application layer protocols (HTTP, FTP, DNS) Transport layer protocols (TCP, UDP) Network Layer (Internet Protocol, routing in the Internet) Data link layer with media access at the example of Ethernet Multimedia applications in the Internet Network management Internet security: IPSec

Module Responsible	Prof. Heiko Falk			
Admission Requirements	None			
Recommended Previous	Basic knowledge in electrical engineering			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following	g learning results		
Professional Competence				
Knowledge	This module deals with the foundations of the functionality of c	omputing systems. It covers the layers	from the assembly-lev	el programming down to
	gates. The module includes the following topics:			
	Introduction			
	Combinational logic: Gates, Boolean algebra, Boolean ful	nctions, hardware synthesis, combination	nal networks	
	Sequential logic: Flip-flops, automata, systematic hardware	•		
	Technological foundations			
	Computer arithmetic: Integer addition, subtraction, multipli	cation and division		
	Basics of computer architecture: Programming models, M	PS single-cycle architecture, pipelining		
	Memories: Memory hierarchies, SRAM, DRAM, caches			
	Input/output: I/O from the perspective of the CPU, principle	s of passing data, point-to-point connect	tions, busses	
Skills	The students perceive computer systems from the architect's computer systems. The students can analyze, how highly spe-			
	components. They are able to distinguish between and to explain up to complete processors.			
	After successful completion of the module, the students are able	to judge the interdependencies betwee	n a physical computer	system and the software
	executed on it. In particular, they shall understand the conseque	nces that the execution of software has	on the hardware-centr	ic abstraction layers from
	the assembly language down to gates. This way, they will be ena	bled to evaluate the impact that these lo	w abstraction levels h	ave on an entire system's
	performance and to propose feasible options.			
Personal Competence				
Social Competence	Students are able to solve similar problems alone or in a group a	nd to present the results accordingly		
Journ John Peterice	and and to only o similar problems alone of it a group a	.a to prodont the reduite accordingly.		
Autonomy	Students are able to acquire new knowledge from specific literatu	re and to associate this knowledge with	other classes.

Content	1. Introduction
	 Principles of digital design Analog versus Digital Gates and flip-flops Aspects of digital design Integrated cicuits Digital devices Time-to-market 2. Number Systems and Codes
	General positional number systems Representation of numbers Binary arithmetic

- Number and character codes
- · Codes for detecting and correcting errors
- Codes for serial data transmission
- Binary prefixes

3. Digital Circuits

- · Logic signals and gates
- Logic families
- CMOS logic
- CMOS circuits: electrical behavior
- CMOS input and output structures
- Bipolar logic
- CMOS logic families
- CMOS/TLL interfacing

4. Combinational Logic Design (Principles)

- Switching algebra
- Combinational-circuit analysis
- Combinational-circuit synthesis
- Minimization
- Timing hazards

5. Combinational Logic Design (Practices)

- · Documentation standards
- · Timing of digital circuits
- Decoders and encoders
- · Three-state devices
- Multiplexers and demultiplexers
- Exclusive-OR gates and parity circuits
- Comparators
- Adders and subtractors
- Combinational multiplier
- Barrel shifter
- Arithmetic and logic unit (ALU)

6. Sequential Logic Design (Principles)

- State concept and clock signal
- Bistable elements
- Asynchronous latches
- Synchronous latches
- Synchronous flip-flops
- Overview: latches and flip-flops
- Clocked synchronous state-machine analysis
- Clocked synchronous state-machine design
- Designing state machines using state diagrams
- Sequential-circuit design with VHDL
- Decomposing state machines

7. Sequential Logic Design (Practices)

- Sequential-circuit documentation standards
- Latches and flip-flops
- Counters
- Shift registers
- Iterative versus sequential circuits
- Synchronous design methodology
- Impediments to synchronous design

8. Memory, PLDs, CPLDs und FPGAs

- ROM, SRAM, DRAM, SDRAM
- Programmable logic devices (PLDs)
- Complex programmable logic devices (CPLDs)
- Field-programmable gate arrays (FPGAs)

9. Microprocessor Technology (Principles)

- Computer history
- Von Neumann architecture
- Components of a microprocessor system

This course teaches the foundations of susystems. In particular, it deals with an introduction into these systems, (notions, common characteristics) and their specification languages (models computation, hip-lavel transformations of susystems, task graphs, specification of real-time applications, translations between different models). Another part covers the hardware of embedded systems: Sonsors, A/D and D/A converters, real-time capable communication hardware, embedded processors, memories, energy dissipation, reconfigurable logic and actuators. The course also features an introduction into real-time operating system middleware and real-time scheduling. Finally, the implementation of embedded systems using hardware/software co-design (hardware/software partitioning, high-level transformations of specifications, energy-efficient real/zations, compilers for embedded processors) is covered. Skills After having attended the course, students shall be able to realize simple embedded systems. The students shall realize which relevant parts technological competences to use in order to obtain a functional embedded systems. In particular, they shall be able to compare different models computations and feasible techniques for system-level design. They shall be able to judge in which areas of embedded system design specific rise vists. Knowledge	Students can represent dynamic system behavior in time and frequency domain, and can in particular experience.	explain properties	of first and second ord
	systems		
	They can explain the dynamics of simple control loops and interpret dynamic properties in terms of frequency.	uency response a	nd root locus
	They can explain the Nyquist stability criterion and the stability margins derived from it.		
	They can explain the role of the phase margin in analysis and synthesis of control loops		
	They can explain the way a PID controller affects a control loop in terms of its frequency response		
	They can explain issues arising when controllers designed in continuous time domain are implemented.	digitally	
Skills			
SKIIIS	Students can transform models of linear dynamic systems from time to frequency domain and vice versa	a	
	They can simulate and assess the behavior of systems and control loops		
	They can design PID controllers with the help of heuristic (Ziegler-Nichols) tuning rules		
	They can analyze and synthesize simple control loops with the help of root locus and frequency respon-	se techniques	
	They can calculate discrete-time approximations of controllers designed in continuous-time and use it for	or digital impleme	ntation
	They can use standard software tools (Matlab Control Toolbox, Simulink) for carrying out these tasks		
Personal Competence			
Social Competence	Students can work in small groups to jointly solve technical problems, and experimentally validate their controll	lar dasians	
Autonomy			o it when colving giv
Autonomy	Students can obtain information from provided sources (lecture notes, software documentation, experimen problems.	it guides) and us	e it when solving giv
	problems.		
	They can assess their knowledge in weekly on-line tests and thereby control their learning progress.

Module M0727: Stochastics	5			
Courses				
Title		Тур	Hrs/wk	СР
Stochastics (L0777)		Lecture	2	4
Stochastics (L0778)		Recitation Section (small)	2	2
Module Responsible	Prof. Marko Lindner			
Admission Requirements	none			
Recommended Previous	Calculus			
Knowledge	Discrete algebraic structures (combinatorics)			
	Propositional logic			
	Fropositionariogic			
Educational Objectives	After taking part successfully, students have reached the following learning	results		
Professional Competence				
Knowledge	Students can explain the main definitions of probability, and they can	n give basic definitions of modeling	elements (randor	m variables, events,
	dependence, independence assumptions) used in discrete and continuous	us settings (joint and marginal distrib	utions, density fund	ctions). Students can
	describe characteristic notions such as expected values, variance, stand	dard deviation, and moments. Stude	nts can define dec	cision problems and
	explain algorithms for solving these problems (based on the chain rule	or Bayesian networks). Algorithms, o	r estimators as the	y are caller, can be
	analyzed in terms of notions such as bias of an estimator, etc. Student car	n describe the main ideas of stochast	ic processes and e	xplain algorithms for
	solving decision and computation problem for stochastic processes. Studer	nts can also explain basic statistical de	tection and estimat	ion techniques.
Skills	Students can apply algorithms for solving decision problems, and they	can justify whether approximation te	chniques are good	d enough in various
	application contexts, i.e., students can derive estimators and judge whether	they are applicable or reliable.

Admission Requirements	None			
Recommended Previous	Module "Computer Engineering"			
Knowledge	The successful completion of the labs will be honored during the evaluation of the module's examination according to the following rules:			
	Upon a passed module examination, the student is	granted a bonus on the examination's ma	rks due to the succe	ssful labs, such that th
	examination's marks are lifted by 0,3 or 0,4, respective	ely, up to the next-better grade.		
	2. The improvement of the grade 5,0 up to 4,3 and of 4,3	up to 4,0 is not possible.		
Educational Objectives	After taking part successfully, students have reached the follo	wing learning results		
Professional Competence				
Knowledge	This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for general-purpose computers and for special-purpose machines (e.g., signal processors). Next, foundational aspects of the micro-architecture of processors are covered. Here, the focus particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies.			
Skills	The students are able to describe the organization of processors. They know the different architectural principles and programming models. The students examine various structures of pipelined processor architectures and are able to explain their concepts and to analyze them w.r.t. criteria like, e.g. performance or energy efficiency. They evaluate different structures of memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism.			
Personal Competence				
Social Competence	Students are able to solve similar problems alone or in a grou	up and to present the results accordingly.		
Autonomy	Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.

Title		Тур	Hrs/wk	CP
Distributed Systems (L1155) Distributed Systems (L1156)		Lecture Recitation Section (small)	2	3
Module Responsible	Prof. Volker Turau	Hecitation Section (Small)	2	3
Admission Requirements	None			
Recommended Previous	Procedural programming			
Knowledge	Object-oriented programming with Java			
	 Networks 			
	Socket programming			
Educational Objectives	After taking part successfully, students have reache	d the following learning results		
Professional Competence				
Knowledge	Students explain the main abstractions of Distributed Systems (Marshalling, proxy, service, address, Remote procedure call, synchron/asynchron			
	system). They describe the pros and cons of different	ent types of interprocess communication. They give	e examples of existing n	niddleware solutions. T
	participants of the course know the main architecture	ral variants of distributed systems, including their $\mathfrak p$	ros and cons. Students c	an describe at least thre
	different synchronization mechanisms.			
Skills	Students can realize distributed systems using at le	ast three different techniques:		
	Proprietary protocol realized with TCP			
	HTTP as a remote procedure call			
	RMI as a middleware			
Personal Competence				
Social Competence				
Autonomy

Module Responsible	Prof. Siegfried Rump			
Admission Requirements	none			
Recommended Previous	Basic knowledge in numerics and discre	te mathematics		
Knowledge				
Educational Objectives	After taking part successfully, students have reached	the following learning results		
Professional Competence				
Knowledge	The students know the difference between precision and accuracy. For several basic problems they know how to solve them approximatively and exactly. They can distinguish between efficiently, not efficiently and principall unsolvable problems.			
Skills	The students are able to analyze complex problems in mathematics and computer science. In particular they car analyze the sensitivity of the solution. For several problems they can derive best possible algorithms with respect to the accuracy of the computed result.			
Personal Competence				
Social Competence	The students have the skills to solve problems together in small groups and to present the achieved results in an appropriate manner.			
Autonomy	The students are able to retrieve necessary informations from the given literature and to combine them with the topics of the lecture. Throughout the lecture they can check their abilities and knowledge on the basis of given exercises and test questions providing an aid to optimize their learning process.

Courses				
Title		Тур	Hrs/wk	CP
Databases (L0337)		Lecture	4	5
Databases (L1150)		Problem-based Learning	1	1
Module Responsible	Dr. Sandro Schulze			
Admission Requirements	None			
Recommended Previous	Students should habe basic knowledge in the following areas:			
Knowledge	Discrete Algebraic Structures			
	Procedural Programming			
	Logic, Automata, and Formal Languages			
	Object-Oriented Programming, Algorithms and Data Structur	es		
Educational Objectives	After taking part successfully, students have reached the following leading to the following lea	arning results		
Professional Competence				
Knowledge	Students can explain the general architecture of an application syst			
	Relationship conceptual modeling languages, and they can enum	·		
	captured with ER and which features cannot be represented. Furth			
	describe how ER models can be systematically transformed into t		·	
	operators of relational algebra, and they know how to use relational		•	
	architecture of a database system from an implementation point of	· ·	, ,	0 1
	techniques can be explained. The role of transactions can be d			•
	characterized. The students can recall why recursion is important to demonstrate how Datalog can be used for information integration		-	
	their syntax and semantics, they describe description logic decision			
	can sketch the idea of ontology-based data access and can name	·		•
	describe the main features of XML and can explain XPath and XQui		abase treory. Last but in	ot least, the students can
	describe the main leatures of AME and can explain At attrant Agui	ny as query languages.		
Skills	Students can apply ER for describing domains for which they recei	re a textual description, and studen	ts can transform relation	al schemata with a given
	set of functional dependencies into third normal form or even Bo	ce-Codd normal form. They can a	lso apply relational alge	ebra, SQL, or Datalog to
	specify queries. Using specific datasets, they can explain how inde	structures work (e.g., B-trees) and	how index structures cha	ange while data is added
	or deleted. They can rewrite queries for better performance of quer	evaluation. Students can analyse	which query language ex	xpressivity is required for
	which application problem. Description logics can be applied for d	omain modeling, and students can	transform ER diagrams	into description logics in
	order to check for consistency and implicit subsumption relations.		s using Datalog and LA	V or GAV rules. Students
	can apply XPath and Xquery to retrieve certain patterns in XML data			
Personal Competence				
Social Competence	Students develop an understanding of social structures in a comp	any used for developing real-world	products. They know the	e responsibilities of data
	analysts, programmers, and managers in the overall production pro		,	
Autonomy

Title	Typ Hrs/wk CP	
Lab Cyber-Physical Systems (L1740)	Problem-based Learning 4 6	
Module Responsible	Prof. Heiko Falk	
Admission Requirements	None	
Recommended Previous	Module "Embedded Systems"	
Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	Cyber-Physical Systems (CPS) are tightly integrated with their surrounding environment, via sensors, A/D and D/A converters, and actors. Due to their particular application areas, highly specialized sensors, processors and actors are common. Accordingly, there is a large variety of different specification approaches for CPS - in contrast to classical software engineering approaches.	
	Based on practical experiments using robot kits and computers, the basics of specification and modelling of CPS are taught. The lab introduces into the area (basic notions, characteristical properties) and their specification techniques (models of computation, hierarchical automata, data flow models, pet nets, imperative approaches). Since CPS frequently perform control tasks, the lab's experiments will base on simple control applications. The experiments will use state-of-the-art industrial specification tools (MATLAB/Simulink, LabVIEW, NXC) in order to model cyber-physical models that interact with the environment via sensors and actors.	
Skills	After successful attendance of the lab, students are able to develop simple CPS. They understand the interdependencies between a CPS and it surrounding processes which stem from the fact that a CPS interacts with the environment via sensors, A/D converters, digital processors, D/A converter and actors. The lab enables students to compare modelling approaches, to evaluate their advantages and limitations, and to decide which technique t use for a concrete task. They will be able to apply these techniques to practical problems. They obtain first experiences in hardware-related softwar development, in industry-relevant specification tools and in the area of simple control applications.	
Personal Competence		
Social Competence	Students are able to solve similar problems alone or in a group and to present the results accordingly.	
Autonomy	Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.

Knowledge	Students can explain the fundamental formulas, relations, and	· ·	-	
	principal behavior of electrostatic, magnetostatic, and curre complex electromagnetic fields by means of superposition o independent electromagnetic fields and are able to explicate.	f solutions for simple fields. The students a		
Skills	Students can apply Maxwell's Equations in integral notation in order to solve highly symmetrical, time-independent, electromagnetic field problems. Furthermore, they are capable of applying a variety of methods that require solving Maxwell's Equations for more general problems. The students can assess the principal effects of given time-independent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of electrostatic, magnetostatic, and electrical flow fields (capacitances, inductances, resistances, etc.) from given fields and dimension them for practical applications.			
Personal Competence				
Social Competence	Students are able to work together on subject related tasks	s in small groups. They are able to prese	nt their results effective	ely (e.g. during exercise
	sessions).			
Autonomy	Students are capable to gather necessary information from preflect their knowledge by means of activities that accompany the exam. Based on respective feedback, students are expective knowledge obtained in this lecture and the content of oth	the lecture, such as short oral quizzes durited to adjust their individual learning proce	ng the lectures and exe ss. They are able to dra	ercises that are related to aw connections between

Courses				
Title		Тур	Hrs/wk	СР
Introduction to Communications and Rand	Lecture	3	4	
Introduction to Communications and Rand	om Processes (L0443)	Recitation Section (large)	1	2
Module Responsible	Prof. Gerhard Bauch			
Admission Requirements	None			
Recommended Previous Knowledge	Mathematics 1-3 Signals and Systems Basic knowledge of probability theory			
Educational Objectives	After taking part successfully, students have reached the following	learning results		
Professional Competence				
Knowledge	The students know and understand the fundamental building blocks of a communications system. They can describe and analyse the individual buildin blocks using knowledge of signal and system theory as well as the theory of stochastic processes. The are aware of the essential resources an evaluation criteria of information transmission and are able to design and evaluate a basic communications system.			-
Skills	The students are able to design and evaluate a basic communications system. In particular, they can estimate the required resources in terms of bandwidth and power. They are able to assess essential evaluation parameters of a basic communications system such as bandwidth efficiency or be error rate and to decide for a suitable transmission method.			
Personal Competence				
Social Competence	The students can jointly solve specific problems.			
Autonomy	The students are able to acquire relevant information from approperiod by solving tutorial problems, software tools, clicker system.	•	ntrol their level of know	rledge during the lecture

Knowledge					
Educational Objectives	After taking part successfully, students have reached the following learn	ning results			
Professional Competence					
Knowledge	The primary purpose of the study of Mechanics III (Fluid Statics, Kiner				
	motions, necessary for the analysis and design of moving machine p	arts, different machinery, vehicles	s, aircraft, spacecraft, au	tomatic control systems,	
	etc.The particular objectives of this course are to:				
	Determine the hydrostatic forces acting on different objects.				
	Analyse stability of floating bodies.				
	3. Analyse the kinematics and kinetics of a particle in different re	eference systems,			
	4. Analyse the motion of the system of particles and forces acting	on it,			
	5. Analyse the plane motion of a rigid body (simple mechanism) a	nd forces acting on it.			
	6. Analyse the three-dimensional motion of a rigid body and forces	s acting on it.			
Skills	At the end of this course the student should be able to:				
	Solve the equilibrium problems with account for hydrostatic pressure forces.				
	2. Analyse stability of simple floating bodies.				
	3. Calculate the velocity and acceleration of a particle in different reference systems.				
	4. Derive and solve the equation of motion of a particle in different reference systems.				
	5. Analyse the motion of the system of particles and forces acting on it with the aid of work-energy and impulse-momentum relationships,				
	6. Calculate the instantaneous linear and angular velocities and accelerations of the planar mechanisms.				
	7. Derive and solve the equations of a plane motion of a rigid body and find forces acting on it,				
	8. Apply work-energy and impulse-momentum relationships to analyse	8. Apply work-energy and impulse-momentum relationships to analyse plane kinetics of a rigid body.			
	9. Calculate the instantaneous linear and angular velocities and accel-	erations of the three-dimensional	motion of a rigid body.		
	10. Derive the equations of a motion of a three-dimensional motion of	a rigid body.			
	11. Apply in three-dimensional kinematics and kinetics of rigid body be	oth methods of vector algebra and	I matrix methods.		
Personal Competence					
Social Competence	Students can: - work in groups and report on the findings, - develop	joint solutions in mixed teams	and present them to ot	hers, - assess the team	
	collaboration and their share in it.				
Autonomy	Students are able to: -solve the problems independently with the help of	of hints, - assess their own strengt	hs and weaknesses, e.g	. with the aid of the mid-	
	term test.				
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84

Module M0708: Electrical E	ngineering III: Circuit Theory and Transients			
Courses				
Title Circuit Theory (L0566) Circuit Theory (L0567)		Typ Lecture Recitation Section (small)	Hrs/wk 3 2	CP 4 2
Module Responsible	Prof. Arne Jacob	risolation coolien (emaily		
Admission Requirements	none			
Recommended Previous	Electrical Engineering I and II, Mathematics I and II			
Knowledge	Elouida Engilocing Fano II, Mailomatoc and II			
Educational Objectives	After taking part successfully, students have reached the following	learning results		
Professional Competence				
Knowledge	Students are able to explain the basic methods for calculating periodic signals. They know the methods for transient analysis frequency behaviour and the synthesis of passive two-terminal-cit	of linear networks in time and in freque		
Skills	The students are able to calculate currents and voltages in linear networks by means of basic methods, also when driven by periodic signals. They are able to calculate transients in electrical circuits in time and frequency domain and are able to explain the respective transient behaviour. They are able to analyse and to synthesize the frequency behaviour of passive two-terminal-circuits.			
Personal Competence				
Social Competence	Students work on exercise tasks in small guided groups. They are	encouraged to present and discuss thei	r results within the gro	up.
Autonomy	The students are able to find out the required methods for solving lectures continuously by means of short-time tests. This allows the knowledge to other courses like Electrical Engineering I and Math	hem to control independently their educ

Courses				
Title		Тур	Hrs/wk	СР
Quantum Mechanics for Engineers (L1686	3)	Lecture	2	3
Quantum Mechanics for Engineers (L168	3)	Recitation Section (small)	2	3
Module Responsible	Prof. Wolfgang Hansen			
Admission Requirements	None			
Recommended Previous Knowledge	 Knowledge in physics, particularly in optics and wave phenomena; knowledge in mathematics, particularly linear algebra, vector calculus, complex numbers and Fourier expansion 			r expansion
Educational Objectives	After taking part successfully, students have reached the follow	wing learning results		
Professional Competence				
Knowledge	The students are able to describe and explain basic terms and principles of quantum mechanics. They can distinguisl commons and differences to classical physics and know, in which situations quantum mechanical phenomena may be expected.			
Skills	The students get the ability to apply concepts and methods of quantum mechanics to simple problems and systems. Vice versa, they are also able to comprehend requirements and principles of quantum mechanical devices.			
Personal Competence				
Social Competence	The students discuss contents of the lectures and present solutions to simple quantum mechanical problems in small groups during the exercises.			ems in small groups
Autonomy	The students are able to independently find answers to simple questions on quantum mechanical systems. The students are able to independently comprehend literature to more complex subjects with quantum mechanical background.

Content	This lecture introduces into fundamental concepts, methods, and definitions in quantum mechanics, which a	are needed	in modern mate	rial and o	device
	science. Applications will be discussed using examples in the field of electronic and optical devices.				
	Central topics are:				
	Schrödinger equation, wave function, operators, eigenstates, eigenvalues, quantum wells, harmonic oscillato	r, tunnel pro	cesses, resonar	nt tunnel	diode.
	band structure, density of states, quantum statistics, Zener-diode, stationary perturbation calculation with				
	example, Fermi's golden rule and transition matrix elements, heterostructure laser, quantum cascade las	ser, many-pa	article physics,	molecule	s and
	exchange interaction, quantum bits and quantum cryptography.

Course L0342: Introduction into Medical Technology and Systems				
Тур	ecture			
Hrs/wk				
CP	3			
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28			
Lecturer	Prof. Alexander Schlaefer			
Language	DE			
Cycle	SoSe			
Content				
	- computer aided surgery			
	- medical sensor systems			
	- medical information systems			
	- regulatory affairs			
	- standard in medical technology			
	The students will work in groups to apply the methods introduced during the lecture using problem based learning.			
Literature	Wird in der Veranstaltung bekannt gegeben.			

Course L0343: Introduction into Medical Technology and Systems		
Тур	Problem-based Learning

Knowledge				
Educational Objectives	After taking part successfully, students have reached	d the following learning results		
Professional Competence				
Knowledge	Students can explain the fundamentals of wave pro	opagation on transmission lines at low and high fre	quencies. They are ab	le to analyze circuits with
	transmission lines in time and frequency domain.	They can describe simple equivalent circuits of trans	mission lines. They ar	e able to solve problems
	with coupled transmission lines. They can present a	nd discuss a self-chosen research topic.		
Skills	Students can analyze and calculate the propagation	on of waves in simple circuits with transmission lines	They are able to ana	dyze circuits in frequency
e.i.iie		yze equivalent circuits of transmission lines. They	•	
		•		bicins including coupled
	transmission lines using the vectorial transmission line equations. They are able to give a talk to professionals.			
Personal Competence				
Social Competence				
	lecture and discuss it in small groups. They are able to present a research topic to professionals and discuss it with them.			
Autonomy	The students can solve problems by their own and are able to acquire skills from the lecture and the literature. They are able to test their known		le to test their knowledge	
using computer animations. They can test their level of knowledge by answering short questions and tests during the lecture. They are able		ney are able to relate their		
	acquired knowledge to other lectures (e.g. Electrical	al Engineering I-III and Mathematics I-III). They can f	amiliarize themselves	with a research topic and
	can prepare a presentation.

Thesis

Module M-001: Bachelor Thesis	
-	
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	According to General Regulations §24 (1):
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods). On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise.
	The students are able to outline the state of research on a selected issue in their subject area.
Skills	 The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems.
	 With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions. The students can take up a critical position on the findings of their own research work from a specialized perspective.
Personal Competence Social Competence Autonomy	 Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way. The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly. The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame. The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.
	The students can apply the essential techniques of scientific work to research of their own.
Workload in Hours	Independent Study Time 360, Study Time in Lecture 0
