Module M0561: D	iscrete Algebraic Structure	es				
Courses						
Title		Тур	Hrs/wk	СР		
Discrete Algebraic Structu		Lecture	2	3		
Discrete Algebraic Structu		Recitation Section (small)	2	3		
-	Prof. Karl-Heinz Zimmermann					
Admission Requirements	None					
Recommended Previous Knowledge	Mathematics from High School.					
Educational Objectives	After taking part successfully, student	s have reached the following lea	rning resul	ts		
Professional Competence						
Knowledge	The students know the important basics of discrete algebraic structures including elementary combinatorial structures, monoids, groups, rings, fields, finite fields, and vector spaces. They also know specific structures like sub sum-, and quotient structures and homomorphisms.					
Skills	Students are able to formalize and analyze basic discrete algebraic structures.					
Personal Competence						
Social Competence	Students are able to solve specific problems alone or in a group and to present the results accordingly.					
Autonomy	Students are able to acquire new knowledge from specific standard books and to associate the acquired knowledge to other classes.					
Workload in Hours	Independent Study Time 124, Study 7	Time in Lecture 56				
Credit points	6					
Studienleistung	None					
Examination	Written exam					
Examination duration and scale	120 min					
Assignment for the Following Curricula	General Engineering Science (German program): Specialisation Computer Science Compulsory General Engineering Science (German program, 7 semester): Specialisation Computer Science: Compulsory Computer Science: Core qualification: Compulsory General Engineering Science (English program): Specialisation Computer Science Compulsory General Engineering Science (English program): Specialisation Computer Science Compulsory General Engineering Science (English program, 7 semester): Specialisation Computer Science: Compulsory General Engineering Science (English program, 7 semester): Specialisation Computer Science: Compulsory Computational Science and Engineering: Core qualification: Compulsory Computational Science and Engineering: Core qualification: Compulsory Technomathematics: Specialisation I. Admission Requirements	None			
Recommended Previous Knowledge				
Educational Objectives	After taking part successfully, studer	nts have reached the following lea	rning resu	lts
Professional Competence				
Knowledge	 The students acquire the following knowledge: They know basic elements of the programming language C. They know the basic data types and know how to use them. They have an understanding of elementary compiler tasks, of the preprocessor and programming environment and know how those interact. They know how to bind programs and how to include external libraries to enhance software packages. They know how to use header files and how to declare function interfaces to create larger programming projects. The acquire some knowledge how the program interacts with the operating system. This allows them to develop programs interacting with the programming environment as well. They learnt several possibilities how to model and implement frequently occurring standard algorithms. 			
Skills	and how to program a The students are able 	ow to judge the complexial Igorithms efficiently. le to model and impleme functionalities. Moreover,	nt algor	ithms for a
Personal Competence	The students acquire the fo			

	 They are able to work in small teams to solve given weekly tasks, to identify and analyze programming errors and to present their results. 			
Social Competence	 They are able to explain simple phenomena to each other directly at the PC. 			
	 They are able to plan and to work out a project in small teams. 			
	 They communicate final results and present programs to their tutor. 			
	 The students take individual examinations as well as a final written examn to prove their programming skills and ability to solve new tasks. 			
Autonomy	 The students have many possibilities to check their abilities when solving several given programming exercises. 			
	 In order to solve the given tasks efficiently, the students have to split those appropriately within their group, where every student solves his or her part individually.

Admission Requirements	
Recommended Previous Knowledge	None
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
	The Non-technical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studi require but are not able to cover fully. Self-reliance, self-management, collaboration a professional and personnel management competences. The department implements the training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting specific competences and a competence level at the Bachelor's or Master's level. T teaching offerings are pooled in two different catalogues for nontechnical complementa courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offeri ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regar the individual development of competences. It also provides orientation knowledge in the fo of "profiles"
	The subjects that can be studied in parallel throughout the student's entire study program need be, it can be studied in one to two semesters. In view of the adaptation problems the individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is obligation to study these subjects in one or two specific semesters during the course studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other acro semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learni in courses are part of the learning architecture and are deliberately encouraged in speci courses.
Var to d	Fields of Teaching
Knowledge	are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, migration studies, communication studies and sustainability researce and from engineering didactics. In addition, from the winter semester 2014/15 students on Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. He the focus is on encouraging goal-oriented communication skills, e.g. the skills required outgoing engineers in international and intercultural situations.
	The Competence Level

	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples use in content topics that refer to different professional application contexts, and in the high scientific and theoretical level of abstraction in the B.Sc. This is also reflected in the different quality of soft skills, which relate to the different tea positions and different group leadership functions of Bachelor's and Master's graduates their future working life.					
	Specialized Competence (Knowledge)					
	Students can					
	 locate selected specialized areas with the relevant non-technical mother discipline, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject. 					
	Professional Competence (Skills)					
	In selected sub-areas students can					
Skills	 apply basic methods of the said scientific disciplines, auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject. 					
Personal						
Competence	Deve and Commetaneous (Consist Chille)					
	Personal Competences (Social Skills) Students will be able					
Social Competence	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group 					
	Personal Competences (Self-reliance)					
Autonomy	 Students are able in selected areas to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) 					
Workload in Hours	Depends on choice of courses

	Direct current networks, complex numbers		
Educational Objectives	After taking part successfully, students have reached the following lea	rning results	3
Professional Competence			
	Students are able to reproduce and explain fundamental theories, principles, and methods related to the theory of alternating currents. They can describe networks of linear elements using a complex notation for voltages and currents. They can reproduce an overview of applications for the theory of alternating currents in the area of electrical engineering. Students are capable of explaining the behavior of fundamental passive and active devices as well as their impact on simple circuits.		
Skills	Students are capable of calculating parameters within simple electrica currents by means of a complex notation for voltages and currents fundamental effects that may occur within electrical networks at altern are able to analyze simple circuits such as oscillating circuits, filter, quantitatively and dimension elements by means of a design. They the fundamental elements of an electrical power supply (transfo compensation of reactive power, multiphase system) and are qualified features. Assignment for the Following Curricula	Useneral Engineering Science (English program), Specialisation Computer Science.		

Course L0131: Objecto	priented Programming, Algorithms and Data Structures
Тур	Lecture
Hrs/wk	4
СР	4
Workload in Hours	Independent Study Time 64, Study Time in Lecture 56
Lecturer	Prof. Rolf-Rainer Grigat
Language	DE
Cycle	SoSe
Content	 Object oriented analysis and design: Objectoriented programming in C++ and Java generic programming UML design patterns Data structures and algorithmes: complexity of algorithms searching, sorting, hash tables, stack, queues, lists, trees (AVL, heap, 2-3-4, Trie, Huffman, Patricia, B), sets, priority queues, directed and undirected graphs (spanning trees, shortest and longest path)
Literature	Skriptum

Courses				
Fitle Automata Theory and For Automata Theory and For		Typ Lecture Recitation Section (small)	Hrs/wk 2	CP 4 2
Module Responsible			2	2
Admission Requirements				
	Participating students should be able	e to		
Recommended	- specify algorithms for simple data structures (such as, e.g., arrays) to solve computational problems			
	 apply propositional logic and predicate logic for specifying and understanding mathematica proofs 			
	- apply the knowledge and skills taug	ht in the module Discrete Algebr	aic Structu	res
Educational Objectives	After taking part successfully, studen	ts have reached the following lea	rning resul	ts
Professional Competence				
Knowledge	they are able to give algorithms for solving decision problems. Students can sho correspondences to Boolean algebra. Students can describe which application problems at hard to represent with propositional logic, and therefore, the students can motivate predical logic, and define syntax, semantics, and decision problems for this representation formalism Students can explain unification and resolution for solving the predicate logic SAT decision problem. Students can also describe syntax, semantics, and decision problems for various kinds of temporal logic, and identify their application areas. The participants of the course can define various kinds of finite automata and can identify relationships to logic and form grammars. The spectrum that students can explain ranges from deterministic ar nondeterministic finite automata and pushdown automata to Turing machines. Students can are also able to demonstrate which decision problems require which expressivity, and, addition, students can transform decision problems w.r.t. one formalism into decision problems w.r.t. other formalisms. They understand that some formalisms easily induce algorithms whereas others are best suited for specifying systems and their propertie Students can describe the relationships between formalisms such as logic, automata, or grammars.			
Skills Personal	Students can apply propositional log formulas. Students analyze applica predicate logic, or temporal logic formalism is best suited for a partic application of algorithms for decis transform nondeterministic automa automata and vice versa. They can s the language emptiness problem in c	ation problems in order to de formulas to represent them. Th ular application problem, and th ion problems to specific formu ta into deterministic ones, or how how parsers work, and they	rive propo ley can ev ley can de llas. Stude derive gr	sitional log valuate whi monstrate t ents can al ammars fro

Language	EN
Cycle	SoSe
Content	 Propositional logic, Boolean algebra, propositional resolution, SAT-2KNF Predicate logic, unification, predicate logic resolution Temporal Logics (LTL, CTL) Deterministic finite automata, definition and construction Regular languages, closure properties, word problem, string matching Nondeterministic automata: Rabin-Scott transformation of nondeterministic into deterministic automata Epsilon automata, minimization of automata, elimination of e-edges, uniqueness of the minimal automaton (modulo renaming of states) Myhill-Nerode Theorem: Correctness of the minimization procedure, equivalence classes of strings induced by automata Pumping Lemma for regular languages: provision of a tool which, in some cases, can be used to show that a finite automaton principally cannot be expressive enough to solve a word problem for some given language Regular expressions vs. finite automata: Equivalence of formalisms, systematic transformation of representations, reductions Pushdown automata and context-free grammars; Definition of pushdown automata to context-free grammars, transformation of formalisms (from pushdown automata to context-free grammars and back) Chomsky normal form CYK algorithm for deciding the word problem for context-free grammars Deterministic pushdown automata

	 Application for parsing, LL(k) or LR(k) grammars and parsers vs. deterministic pushdown automata, compiler compiler 16. Regular grammars 17. Outlook: Turing machines and linear bounded automata vs general and context-sensitive grammars 18. Chomsky hierarchy 19. Mealy- and Moore automata: Automata with output (w/o accepting states), infinite state sequences, automata networks 20. Omega automata: Automata for infinite input words, Büchi automata, representation of state transition systems, verification w.r.t. temporal logic specifications (in particular LTL) 21. LTL safety conditions and model checking with Büchi automata, relationships between automata and logic 22. Fixed points, propositional mu-calculus 23. Characterization of regular languages by monadic second-order logic (MSO)

ourse L0882: Management Tutorial		
Тур	Recitation Section (large)	
Hrs/wk	2	
СР	3	
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28	
Lecturer	Prof. Christoph Ihl, Katharina Roedelius, Tobias Vlcek	
Language	DE	
Cycle	WiSe/SoSe	
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on self-selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the business knowledge from the lecture should come to practical use. The group projects are guided by a mentor.	
Literature	Relevante Literatur aus der korrespondierenden Vorlesung.

Content	In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs. In the second part of the lecture an introduction to Internet security is given. This class comprises: Application layer protocols (HTTP, FTP, DNS) Transport layer protocols (TCP, UDP) Network Layer (Internet Protocol, routing in the Internet) Data link layer with media access at the example of Ethernet Network management Internet security: IPSec Internet security: Firewalls

Module Responsible	Prof. Anusch Taraz		
Admission Requirements	None		
Recommended Previous Knowledge	Mathematics I + II		
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge	 Students can name the basic concepts in the area of analysis and differential equations. They are able to explain them using appropriate examples. Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples. They know proof strategies and can reproduce them. 		
Skills	 Students can model problems in the area of analysis and differential equations with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods. Students are able to discover and verify further logical connections between the concepts studied in the course. For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results. 		
Personal Competence			
Social Competence	 Students are able to work together in teams. They are capable to use mathematics as a common language. In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers. 		
Autonomy	 Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them. Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.

Module M0672: Signals and Systems Courses Title Hrs/wk CP Тур Signals and Systems (L0432) Lecture 4 Signals and Systems (L0433) 2 Recitation Section (small) 2 Module Responsible Prof. Gerhard Bauch Admission None Requirements Mathematics 1-3 The modul is an introduction to the theory of signals and systems. Good knowledge in maths Recommended as covered by the moduls Mathematik 1-3 is expected. Further experience with spectral **Previous Knowledge** transformations (Fourier series, Fourier transform, Laplace transform) is useful but not required. Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence The students are able to classify and describe signals and linear time-invariant (LTI) systems using methods of signal and system theory. They are able to apply the fundamental transformations of continuous-time and discrete-time signals and systems. They can describe Knowledge and analyse deterministic signals and systems mathematically in both time and image domain. In particular, they understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a discrete-time signal. The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and system theory. They can analyse and design basic Skills systems regarding important properties such as magnitude and phase response, stability. linearity etc.. They can assess the impact of LTI systems on the signal properties in time and frequency domain. Personal Competence Social Competence The students can jointly solve specific problems. The students are able to acquire relevant information from appropriate literature sources. They Autonomy can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system. Educational Objectives	After taking part success	sfully, students	have reached	the following lea	rning resul	ts
Professional Competence						
	Embedded systems can be defined as information processing systems embedded into enclosing products. This course teaches the foundations of such systems. In particular, it deals with an introduction into these systems (notions, common characteristics) and their specification languages (models of computation, hierarchical automata, specification of distributed systems, task graphs, specification of real-time applications, translations between different models). Another part covers the hardware of embedded systems: Sonsors, A/D and D/A converters, real-time capable communication hardware, embedded processors, memories, energy dissipation, reconfigurable logic and actuators. The course also features an introduction into real-time operating systems using hardware/software co-design (hardware/software partitioning, high-level transformations of specifications, energy-efficient realizations, compilers for embedded processors) is covered.					
Personal	judge in which areas of	embedded sys	item design sp	ecific risks exist.		
Competence						
Social Competence	Students are able to solve similar problems alone or in a group and to present the results accordingly.					
Autonomy	Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.

Courses							
Title Introduction to Control Sys	stems (I 0654)		Typ Lecture	Hrs/wk 2	СР 4		
ntroduction to Control Sy			Recitation Section (_	2		
Module Responsible		erner					
Admission Requirements	None	Jone					
Recommended Previous Knowledge		of signals and systems	in time and frequency do	main, Laplace t	ransform		
Educational Objectives	After taking part	successfully, students	have reached the followin	g learning resu	lts		
Professional Competence							
Knowledge	 Students can represent dynamic system behavior in time and frequency domain, and can in particular explain properties of first and second order systems They can explain the dynamics of simple control loops and interpret dynamic properties in terms of frequency response and root locus They can explain the Nyquist stability criterion and the stability margins derived from it. They can explain the role of the phase margin in analysis and synthesis of contro loops They can explain the way a PID controller affects a control loop in terms of its frequency response They can explain issues arising when controllers designed in continuous time domain are implemented digitally 						
Skills	domain a They car They car They car frequenc They car time and	and vice versa n simulate and assess n design PID controller n analyze and synthes ry response techniques n calculate discrete-tim use it for digital impler n use standard softwa	e approximations of contro	nd control loops (Ziegler-Nichol vith the help of ollers designed	s) tuning rule root locus ai in continuou		
Personal Competence							
Social Competence	Students can w validate their co		p jointly solve technical p	problems, and e	experimenta		
Autonomy	Students can obtain information from provided sources (lecture notes, software documentation, experiment guides) and use it when solving given problems. They can assess their knowledge in weekly on-line tests and thereby control their learning

Admission Requirements	None					
Recommended Previous Knowledge	 Calculus Discrete algebraic structures (combinatorics) Propositional logic 					
Educational Objectives	After taking part successfully, students have reached the following learning results					
Professional						
Competence Knowledge	Students can explain the main definitions of probability, and they can give basic definitions of modeling elements (random variables, events, dependence, independence assumptions) used in discrete and continuous settings (joint and marginal distributions, density functions). Students can describe characteristic notions such as expected values, variance, standard deviation, and moments. Students can define decision problems and explain algorithms for					
Skills	Students can apply algorithms for solving decision problems, and they can justify whethe approximation techniques are good enough in various application contexts, i.e., students car derive estimators and judge whether they are applicable or reliable.					
Personal Competence						
Social Competence	- Students are able to work together (e.g. on their regular home work) in heterogeneous composed teams (i.e., teams from different study programs and background knowledge) ar to present their results appropriately (e.g. during exercise class).					
- Students are capable of checking their understanding of complex concept They can specify open questions precisely and know where to get help in solution of the contents of other lectures						
Autonomy	- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.

Module M0732: Software Engineering Courses Title Hrs/wk СР Тур Software Engineering (L0627) Lecture 3 Software Engineering (L0628) Recitation Section (small) 2 3 Module Responsible Prof. Sibylle Schupp Admission None Requirements Automata theory and formal languages Recommended Procedural programming or Functional programming **Previous Knowledge** Object-oriented programming, algorithms, and data structures Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence Students explain the phases of the software life cycle, describe the fundamental terminology and concepts of software engineering, and paraphrase the principles of structured software development. They give examples of software-engineering tasks of existing large-scale Knowledge systems. They write test cases for different test strategies and devise specifications or models using different notations, and critique both. They explain simple design patterns and the major activities in requirements analysis, maintenance, and project planning. For a given task in the software life cycle, students identify the corresponding phase and select an appropriate method. They choose the proper approach for quality assurance. They design tests for realistic systems, assess the quality of the tests, and find errors at different Skills levels. They apply and modify non-executable artifacts. They integrate components based on interface specifications. Personal Competence Students practice peer programming. They explain problems and solutions to their peer. They Social Competence communicate in English. Using on-line quizzes and accompanying material for self study, students can assess their level of knowledge continuously and adjust it appropriately. Working on exercise problems, Autonomy they receive additional feedback. Title Quantum Mechanics for E Quantum Mechanics for E				Typ Lecture Recitation Sectio	Hrs/wl 2 n (small) 2	4 (3 3	
Module Responsible		ansen					
Admission Requirements	None						
Recommended Previous Knowledge	 Knowledge in physics, particularly in optics and wave phenomena; knowledge in mathematics, particularly linear algebra, vector calculus complex numbers and Fourier expansion 						
Educational Objectives	After taking part s	uccessfu	lly, students have	reached the follow	wing learning re	sults	
Professional Competence							
Knowledge	The students are able to describe and explain basic terms and principles of quantum mechanics. They can distinguish commons and differences to classical physics and know, in which situations quantum mechanics phenomena may be expected.						
Skills	The students get the ability to apply concepts and methods of quantur mechanics to simple problems and systems. Vice versa, they are also able t comprehend requirements and principles of quantum mechanical devices.						
Personal Competence							
Social Competence	The students discuss contents of the lectures and present solutions to simp quantum mechanical problems in small groups during the exercises.						
Autonomy	The students are able to independently find answers to simple questions of quantum mechanical systems. The students are able to independently comprehend literature to more complex subjects with quantum mechanical background.

	This lecture introduces into fundamental concepts, methods, and definitions in quantum mechanics, which are needed in modern material and device science. Applications will be discussed using examples in the field of electronic and optical devices.			
	Central topics are:			
Content	Schrödinger equation, wave function, operators, eigenstates, eigenvalues, quantum wells, harmonic oscillator, tunnel processes, resonant tunnel diode, band structure, density of states, quantum statistics, Zener-diode, stationary perturbation calculation with the quantum-confined Stark effect as an example, Fermi's golden rule and transition matrix elements, heterostructure laser, quantum cascade laser, many-particle physics, molecules and exchange interaction, quantum bits and quantum cryptography.			
Literature	 David J. Griffiths: "Quantenmechanik, eine Einführung", Pearson (2012), ISBN 97 8632-6514-4. David K. Ferry: "Quantum Mechanics", IOP Publishing (1995), ISBN 0-7503-038 (hbk) bzw. 0-7503-0328-X (pbk). M. Jaros: "Physics and Applications of Semiconductor Microstructures ", Clare Press (1989), ISBN: 0-19-851994-X bzw. 0-19-853927-4 (Pbk). Module M0791: Computer Architecture Courses Title Hrs/wk СР Тур Computer Architecture (L0793) Lecture 2 3 Project-/problem-based 2 Computer Architecture (L0794) 2 Learning Recitation Section (small) 1 Computer Architecture (L1864) 1 Module Responsible Prof. Heiko Falk Admission None Requirements Recommended Module "Computer Engineering" **Previous Knowledge** Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for generalpurpose computers and for special-purpose machines (e.g., signal processors). Next foundational aspects of the micro-architecture of processors are covered. Here, the focus Knowledge particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies. The students are able to describe the organization of processors. They know the different architectural principles and programming models. The students examine various structures of pipelined processor architectures and are able to explain their concepts and to analyze them Skills w.r.t. criteria like, e.g., performance or energy efficiency. They evaluate different structures of memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism. Personal Competence Students are able to solve similar problems alone or in a group and to present the results Social Competence accordingly. Students are able to acquire new knowledge from specific literature and to associate this Autonomy knowledge with other classes. Module M1300: S	oftware Development					
Courses						
Title		Typ	Hrs/wk	СР		
Software Development (La	1790)	Project-/problem-based Learning	2	5		
Software Development (La	1789)	Lecture	1	1		
Module Responsible	Prof. Sibylle Schupp					
Admission Requirements	None					
Recommended Previous Knowledge	 Introduction to Software Engineering Programming Skills Experience with Developing Small to Medium-Size Programs 					
Educational Objectives	After taking part successfully, student	s have reached the following lea	arning resu	Its		
Professional Competence						
Knowledge	Students explain the fundamental concepts of agile methods, describe the process of test-driven development, and explain how continuous integration can be used in different scenarios. They give examples of selected pitfalls in software development, regarding scalability and other non-functional requirements. They write unit tests and build scripts and combine them in a corresponding integration environment. They explain major activities in requirements analysis, program comprehension, and agile project development.					
Skills	For a given task on a legacy system, students identify the corresponding parts in the system and select an appropriate method for understanding the details. They choose the proper approach of splitting a task in independent testable and extensible pieces and, thus, solve the task with proper methods for quality assurance. They design tests for legacy systems, create automated builds, and find errors at different levels. They integrate the resulting artifacts in a continuous development environment					
Personal						
	Students discuss different design de They communicate in English.	ecisions in a group. They defe	nd their so	olutions orally		
	Using accompanying tools, students adjust it appropriately. Within limits completion, students can identify and propose solutions. Within this field, necessary competencies. Technical Thermodynami		Recitation Section (small)		1	
Module Responsible	Prof. Gerhard Schmitz				
Admission Requirements	None				
Recommended Previous Knowledge	Elementary knowledge in Mathematic	s and Mechanics			
Educational Objectives	After taking part successfully, students	have reached the following lea	rning resu	lts	
Professional Competence					
	Students are familiar with the laws of	Thermodynamics. They know th	e relation	of the kinds o	
	energy according to 1 st law of Therr				
Knowledge	conversions according to 2 nd law of Thermodynamics. They are able to distinguish between state variables and process variables and know the meaning of different state variables like temperature, enthalpy, entropy and also the meaning of exergy and anergy. They are able to draw the Carnot cycle in a Thermodynamics related diagram. They know the physica difference between an ideal and a real gas and are able to use the related equations of state They know the meaning of a fundamental state of equation and know the basics of two phase Thermodynamics.				
Skills	Students are able to calculate the internal energy, the enthalpy, the kinetic and the potenti energy as well as work and heat for simple change of states and to use this calculations f the Carnot cycle. They are able to calculate state variables for an ideal and for a real gas fro measured thermal state variables.				
Personal Competence					
-	The students are able to discuss in sm	nall groups and develop an appr	roach.		
Autonomy	Students are able to define indepe knowledge as well as to find ways to u		nowledge	from existing

Educational Objectives	After taking part successfully, students	have reached the following lea	rning resu	lts
Professional				
Competence				
Knowledge	 Students can name the basic concepts in Mathematics IV. They are able to explain them using appropriate examples. Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples. They know proof strategies and can reproduce them. 			
Skills	 Students can model problems in Mathematics IV with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods. Students are able to discover and verify further logical connections between the concepts studied in the course. For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results. 			
Personal Competence				
Social Competence	 Students are able to work toge a common language. In doing so, they can commu cooperating partners. Moreove understanding of their peers. 	nicate new concepts accordin	g to the i	needs of the
Autonomy	 Students are capable of check own. They can specify open que them. Students have developed suffice a goal-oriented manner on hard 	estions precisely and know who sient persistence to be able to w	ere to get	help in solvin

Technical Thermodynamic		Lecture	2	4
Technical Thermodynamic Technical Thermodynamic		Recitation Section (large) Recitation Section (small)		1
Module Responsible			I	I
Admission Requirements				
Recommended Previous Knowledge	Elementary knowledge in Mathemati	cs, Mechanics and Technical The	ermodynan	nics I
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students are familiar with different cycle processes like Joule, Otto, Diesel, Stirling, Seiliger and Clausius-Rankine. They are able to derive energetic and exergetic efficiencies and know the influence different factors. They know the difference between anti clockwise and clockwise cycles (heat-power cycle, cooling cycle). They have increased knowledge of steam cycles and are able to draw the different cycles in Thermodynamics related diagrams. They know the laws of gas mixtures, especially of humid air processes and are able to perform simple combustion calculations. They are provided with basic knowledge in gas dynamics and know the definition of the speed of sound and know about a Laval nozzle.			
Skills	Students are able to use thermod Especially they are able to formulat optimise technical processes. They a an outflowing gas from a tank. They a abstract formal procedure.	te energy, exergy- and entropy are able to perform simple safety	balances calculation	and by this ns in regard
Personal Competence				
Social Competence	The students are able to discuss in s	mall groups and develop an appr	oach.	
,	Students are able to define indep knowledge as well as to find ways to		nowledge	from existir

Module M1105: Mechanics III (GES) Courses Title Hrs/wk СР Тур Mechanics III (GES) (L1421) Lecture 3 Mechanics III (GES) (L1420) Recitation Section (small) 2 2 Mechanics III (GES) (L1419) Recitation Section (large) 1 1 Module Responsible Prof. Radoslaw Iwankiewicz Admission None Requirements Recommended None Previous Knowledge Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence The primary purpose of the study of Mechanics III (Fluid Statics, Kinematics and Kinetics) is to develop the capacity to predict the effects of forces and motions, necessary for the analysis and design of moving machine parts, different machinery, vehicles, aircraft, spacecraft, automatic control systems, etc. The particular objectives of this course are to: 1. Determine the hydrostatic forces acting on different objects. Knowledge 2. Analyse stability of floating bodies. 3. Analyse the kinematics and kinetics of a particle in different reference systems, 4. Analyse the motion of the system of particles and forces acting on it, 5. Analyse the plane motion of a rigid body (simple mechanism) and forces acting on it. 6. Analyse the three-dimensional motion of a rigid body and forces acting on it. At the end of this course the student should be able to: 1. Solve the equilibrium problems with account for hydrostatic pressure forces. 2. Analyse stability of simple floating bodies. 3. Calculate the velocity and acceleration of a particle in different reference systems. 4. Derive and solve the equation of motion of a particle in different reference systems. 5. Analyse the motion of the system of particles and forces acting on it with the aid of workenergy and impulse-momentum relationships, 6. Calculate the instantaneous linear and angular velocities and accelerations of the planar mechanisms. Skills 7. Derive and solve the equations of a plane motion of a rigid body and find forces acting on it. 8. Apply work-energy and impulse-momentum relationships to analyse plane kinetics of a rigid body. 9. Calculate the instantaneous linear and angular velocities and accelerations of the threedimensional motion of a rigid body. 10. Derive the equations of a motion of a three-dimensional motion of a rigid body. 11. Apply in three-dimensional kinematics and kinetics of rigid body both methods of vector algebra and matrix methods. Personal Competence

Social Competence	Students can: - work in groups and report on the findings, - develop joint solutions in mixed teams and present them to others, - assess the team collaboration and their share in it.
Autonomy	Students are able to: -solve the problems independently with the help of hints, - assess their own strengths and weaknesses, e.g. with the aid of the mid-term test.
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84
Credit points	6
Studienleistung	None
Examination	Written exam
Examination duration and scale2 hours Fluid Statics: hydrostatic pressure, buoyancy, stability of floating vessels. Kinem of particle, of plane and 3D rigid bod,y. Kinetics of particle, system of particles, of plane 3D rigid body. Vector and matrix algebra formulation.

Admission Requirements	None			
Recommended Previous Knowledge	Electrical Engineering I and II, Mathematics I and II			
Educational Objectives	After taking part successfully, students have reached the follow	ing lear	rning resul	lts
Professional Competence				
Knowledge	Students are able to explain the basic methods for calculating electrical circuits. They know the Fourier series analysis of linear networks driven by periodic signals. They know the methods for transient analysis of linear networks in time and in frequency domain, and they are able to explain the frequency behaviour and the synthesis of passive two-terminal-circuits			
Skills	The students are able to calculate currents and voltages in linear networks by means of basi methods, also when driven by periodic signals. They are able to calculate transients i electrical circuits in time and frequency domain and are able to explain the respectiv transient behaviour. They are able to analyse and to synthesize the frequency behaviour of passive two-terminal-circuits.			
Personal				
Competence				
Social Competence	Students work on exercise tasks in small guided groups. They discuss their results within the group.	are end	couraged 1	o present ar
Autonomy	The students are able to find out the required methods for solving the given practice problems Possibilities are given to test their knowledge during the lectures continuously by means or short-time tests. This allows them to control independently their educational objectives. The can link their gained knowledge to other courses like Electrical Engineering I and Mathematics I.

Module Responsible	Prof. Thanh Trung Do				
Admission Requirements	None				
Deserved	Basics of mathematics, in particular complexe nu	umbers, integrals, diffe	erentials		
Recommended Previous Knowledge	Basics of electrical engineering and mechanical	engineering			
Educational Objectives	After taking part successfully, students have read	ched the following lea	rning resul	S	
Professional					
Competence					
	Students can to draw and explain the basic prin	ciples of electric and r	nagnetic fie	elds.	
Knowledge	They can describe the function of the standard types of electric machines and present th corresponding equations and characteristic curves. For typically used drives they can explai the major parameters of the energy efficiency of the whole system from the power grid to th driven engine.				
Skills	Students arw able to calculate two-dimensional electric and magnetic fields in particula ferromagnetic circuits with air gap. For this they apply the usual methods of the design at electric machines. They can calulate the operational performance of electric machines from their give characteristic data and selected quantities and characteristic curves. They apply the usual equivalent circuits and graphical methods.				
Personal Competence					
Social Competence	none				
	Students are able independently to calculate electric and magnatic fields fo applications. They are able to analyse independently the operational performance of electric machines from the charactersitic data and theycan calculate thereof selected quantities and characteristic curves.

TUHH Hamburg University of Tachnolog

Thesis

Module M-001: B	achelor Thesis
-	
Courses Title	Typ Hrs/wk CP
	Professoren der TUHH
Admission Requirements	According to General Regulations §21 (1):
Recommended Previous Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 The students can select, outline and, if need be, critically discuss the most importan scientific fundamentals of their course of study (facts, theories, and methods). On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise. The students are able to outline the state of research on a selected issue in their subject area.
Skills	 The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems. With the aid of the methods they have learnt during their studies the students car analyze problems, make decisions on technical issues, and develop solutions. The students can take up a critical position on the findings of their own research worl from a specialized perspective.
Personal Competence	
Social Competence	 Both in writing and orally the students can outline a scientific issue for an exper audience accurately, understandably and in a structured way. The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their owr assessments and viewpoints convincingly.
Autonomy	 The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame. The students are able to identify, open up, and connect knowledge and materia necessary for working on a scientific problem. The students can apply the essential techniques of scientific work to research of thei own.
