## Program description

---

---

### Content

Engineering disciplines utilize the results of computer science and mathematics research to an ever greater extent, both in the development of products and in the products themselves. This trend will certainly continue. New results in computer science and mathematics thus become an important innovation factor in engineering and are therefore central areas of competence for an engineer and a technical university. This has a direct impact on the objectives of the computer science and engineering course.

Engineering education benefits significantly from computer science, and computer science benefits significantly from the modeling techniques used in engineering. To be prepared for the requirements of the future, the aim of the course is to offer combined training in computer science, mathematics and engineering. This is a particularly sustainable training principle, both for industry and for research. Computer engineering opens the line between hardware and software in the light of engineering applications. Decisions as to which parts of a system should be implemented more cheaply in hardware or better with the help of flexible software can only be made and carried out on the basis of solid knowledge of both disciplines, both IT and engineering. The aim of the course is to introduce the problem and to deal with both essential aspects.

The objectives of the basic qualification are to impart knowledge, skills and competences in the fields of computer science, mathematics and engineering to the students so that new areas of knowledge and thus also new products can be developed. Choices that support student in self-determined studies in specialisation areas are offered in specialisation areas.

### Career prospects

Successful completion of the bachelor's degree in computer science engineering at TUHH enables graduates to start a career in science, computer science engineering or a related subject, as well as an early career start in areas from trade, industry and administration (professional qualification). The graduates will then primarily work as engineers and system developers for software and hardware.

Because of their broad training, graduates are particularly requested in the job market, since the bridge between IT specialists and engineers is essential in system development. Depending on the chosen specialization, the course trains computer scientists with an engineering background or engineers with a computer science background, who find very good employment opportunities on the German and international job market largely regardless of economic trends.

### Learning target

The learning objectives leading towards the described qualification are divided below into the categories knowledge, skills, social skills and independence.

#### Knowledge

The learned knowledge comprises facts, principles and theories in the subjects of computer science, engineering and mathematics.

1. Students can reproduce, define and explain known standard languages for representation used in computer science and mathematics (logic, automata theory, formal languages,

- graph theory, linear algebra, analysis, discrete algebraic structures, stochastics, systems theory, etc.) necessary for the formal modeling of application problems (syntax, semantics, decision problems).
2. Students can reproduce elementary data and index structures (vectors, matrices, relations, trees, files, pages) for sequential algorithms (also in hardware-related form) and show their advantages and disadvantages for special tasks. Students can specify algorithms to solve decision problems for formal modeling techniques. They can reproduce the basic structure of simple computing systems at different levels of abstraction in an architecture, so that you can explain how algorithms are executed on concrete systems.
  3. The students are familiar with a whole range of classic applications of computer engineering and mathematical modeling techniques and can explain them.
  4. Students know how problems can be broken down into smaller sub-problems (reductionist approach) and how partial results can be combined to form an overall result. Students can also describe problems that arise from error propagation and error accumulation and provide examples. Students can reproduce and justify that security, reliability, and maintenance of partial services in the event of an error (graceful degradation) can only result from concrete design decisions in an initial draft and cannot be integrated into an existing draft afterwards with reasonable effort.
  5. Graduates are able to explain the importance of entrepreneurial planning and goals, to analyze the organizational and personnel structures as well as the production and procurement systems of companies, to classify pricing policy and other important instruments for system development (e.g. marketing).

### **Technical Skills**

The course of Computer Science and Engineering teaches the ability to apply learned knowledge in order to complete tasks and thus solve problems in many facets.

1. Students can design and develop formal representation languages (syntax, semantics, decision problems), and they can assess and determine the expressiveness of the formalisms necessary for simple applications. Students can map decision problems of different formalisms onto one another and thus compare the expressiveness of formalisms.
2. Students can examine algorithms for decision problems for completeness and correctness or convergence behavior and approximation quality, and they can demonstrate whether an algorithm is optimal or for which types of inputs the worst case occurs with regard to the runtime behavior of an algorithm.
3. Students can implement algorithms in programming or hardware description languages, test them and integrate them into application systems using operating systems to manage resources and use databases to manage large amounts of data. Students can demonstrate that desired states of a system are reached (controllability, accessibility) and that undesired states are never reached (safety and liveliness properties). Students can implement computer structures in hardware-related units.
4. Students can use formal modeling techniques for engineering applications to create, review, or evaluate simple, prototypical systems to solve problems from an application context (in terms of a simulation, as a data management system, as an application, etc.). Students can explain how models, programs and systems are automatically translated into corresponding units at a lower level of abstraction.
5. Students can design interfaces that allow systems to be built from modules or layers, the internals of which can be adapted without changing the interfaces. Students are able to describe design criteria, how systems can be reused and can also be used in other systems.

### **Social skills**

The ability and the will to work with others in a goal-oriented manner, to grasp their interests and social situations, to communicate and to help shape the working and living environment is broken down as follows for the degree course in Computer Science and Engineering:

1. Students understand that methods of computer science and mathematics are developed across all applications and that a major achievement of the computer science engineer is on

the one hand in the professional application of the methods and on the other hand in demonstrating others (clients, project partners, colleagues, ...) that a method is (in a specific sense) optimal.

2. Students can form teams to work in groups, define and distribute subtasks, make appointments, integrate partial solutions. They are able to communicate, interact socially and behave appropriately in the event of conflicts.
3. Students explain the problems described in a scientific paper and the solutions developed in the paper in a field of computer science or mathematics, evaluate the proposed solutions in a lecture and respond to scientific questions, additions and comments.
4. Students describe scientific questions in a field of computer science, engineering or mathematics and explain in a presentation an approach they have developed to solve it and respond appropriately to inquiries, additions and comments.

### **Competence to work independently**

The ability and willingness to act independently and responsibly, to reflect on one's own actions and those of others, and also to further develop one's own ability to act, is broken down as follows into finer aspects.

1. The students independently evaluate the advantages and disadvantages of representation formalisms for specific tasks, compare different algorithms and data structures as well as programming languages and programming tools, and they independently select the best solution.
2. The graduates independently develop a small, very clearly defined scientific sub-area, can present it in a presentation and actively follow the presentations of other students, so that an interactive discourse on a scientific topic arises.
3. Students integrate themselves into a project context and assume responsibility for tasks in a software or hardware development project.

### **Program structure**

The curriculum of the Bachelor's degree in Computer Science and Engineering is structured as follows. In addition to the compulsory courses from core qualification, a minimum number of credit points must be taken from each of the areas of computer science, mathematics and engineering:

1. Core qualification: 138 credit points
2. Computer science: 12 credit
3. Mathematics & Engineering: 6 credit points

To deepen their studies, students can choose lectures from the entire catalog of technical events at the TUHH. A total of 12 credit points must be achieved. The bachelor thesis is also rated with 12 credit points. This results in a total effort of 180 credit points.

The following four course plans describe special features of the IiW Bachelor's degree

#### **E. Embedded systems**

1. Core subjects in computer science
  - Computer architecture
  - Operating systems
2. Core subjects: mathematics and engineering
  - Electronic components
3. Additional technical courses
  - Semiconductor circuit technology
  - Compiler construction

#### **I. Smart grids**

1. Core subjects in computer science
  - Operating systems

- Software development
- 2. Core subjects: mathematics and engineering
  - Electrical energy systems I
- 3. Additional technical courses
  - Theoretical electrical engineering I
  - Electrical engineering III: network theory and transients

#### **M. Medical systems**

- 1. Core subjects in computer science
  - Introduction to information security
  - Software engineering
- 2. Core subjects: mathematics and engineering
  - Introduction to medical technology systems
- 3. Additional technical courses
  - Cyber-physical systems laboratory
  - Computer architecture

#### **C. Computational Foundations**

- 1. Core subjects in computer science
  - Functional programming
  - Predictability and complexity
- 2. Core subjects: mathematics and engineering
  - Combinatorial structures and algorithms
- 3. Additional technical courses
  - Solvers for sparse linear equation systems
  - Mathematics IV

## Core qualification

### Module M0561: Discrete Algebraic Structures

#### Courses

| Title   | Typ   | Hrs/wk    | CP |
|---|---|-----------|----|
| Discrete Algebraic Structures (L0164)         | Lecture   | 2         | 3  |
| Discrete Algebraic Structures (L0165)         | Recitation (small)  | Section 2 | 3  |
| <b>Module Responsible</b>                     | Prof. Karl-Heinz Zimmermann   |           |    |
| <b>Admission Requirements</b>                 | None  |           |    |
| <b>Recommended Previous Knowledge</b>         | Mathematics from High School.   |           |    |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results  |           |    |
| <b>Professional Competence</b>                | <p><i>Knowledge</i> The students know the important basics of discrete algebraic structures including elementary combinatorial structures, monoids, groups, rings, fields, finite fields, and vector spaces. They also know specific structures like sub-, sum-, and quotient structures and homomorphisms.</p> <p><i>Skills</i> Students are able to formalize and analyze basic discrete algebraic structures.</p>  |           |    |
| <b>Personal Competence</b>                    | <p><i>Social Competence</i> Students are able to solve specific problems alone or in a group and to present the results accordingly.</p> <p><i>Autonomy</i> Students are able to acquire new knowledge from specific standard books and to associate the acquired knowledge to other classes.</p>   |           |    |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56  |           |    |
| <b>Credit points</b>                          | 6   |           |    |
| <b>Course achievement</b>                     | None  |           |    |
| <b>Examination</b>                            | Written exam  |           |    |
| <b>Examination duration and scale</b>         | 120 min   |           |    |
| <b>Assignment for the Following Curricula</b> | General Engineering Science (German program, 7 semester): Specialisation<br>Computer Science: Compulsory<br>Computer Science: Core qualification: Compulsory<br>Data Science: Core qualification: Compulsory<br>General Engineering Science (English program, 7 semester): Specialisation<br>Computer Science: Compulsory<br>Computational Science and Engineering: Core qualification: Compulsory<br>Orientierungsstudium: Core qualification: Elective Compulsory |           |    |

## Module M0577: Non-technical Courses for Bachelors

|                                       |   |
|---------------------------------------|---|
| <b>Module Responsible</b>             | Dagmar Richter  |
| <b>Admission Requirements</b>         | None  |
| <b>Recommended Previous Knowledge</b> | None  |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |
| <b>Professional Competence</b>        | <p><b>The Non-technical Academic Programms (NTA)</b></p> <p>imparts skills that, in view of the TUHH’s training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its <b>teaching architecture</b>, in its <b>teaching and learning arrangements</b>, in <b>teaching areas</b> and by means of teaching offerings in which students can qualify by opting for <b>specific competences</b> and a <b>competence level</b> at the Bachelor’s or Master’s level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.</p> <p><b>The Learning Architecture</b></p> <p>consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.</p> <p>The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of “profiles”</p> <p>The subjects that can be studied in parallel throughout the student’s entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.</p> <p><b>Teaching and Learning Arrangements</b></p> <p>provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.</p> <p><b>Fields of Teaching</b></p> <p>are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor’s courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.</p> <p>The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.</p> <p><b>The Competence Level</b></p> <p>of the courses offered in this area is different as regards the basic training objective</p> |

*Knowledge*

|                          |   |
|--------------------------|---|
|                          | <p>in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.</p> <p>This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.</p> <p><b>Specialized Competence (Knowledge)</b></p> <p>Students can</p> <ul style="list-style-type: none"> <li>• locate selected specialized areas with the relevant non-technical mother discipline,</li> <li>• outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,</li> <li>• different specialist disciplines relate to their own discipline and differentiate it as well as make connections,</li> <li>• sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,</li> <li>• Can communicate in a foreign language in a manner appropriate to the subject.</li> </ul> <p><b>Professional Competence (Skills)</b></p> <p>In selected sub-areas students can</p> <ul style="list-style-type: none"> <li>• apply basic methods of the said scientific disciplines,</li> <li>• question a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,</li> <li>• to handle simple questions in aforementioned scientific disciplines in a successful manner,</li> <li>• justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.</li> </ul> <p><b>Personal Competence</b></p> <p><b>Personal Competences (Social Skills)</b></p> <p>Students will be able</p> <ul style="list-style-type: none"> <li>• to learn to collaborate in different manner,</li> <li>• to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,</li> <li>• to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),</li> <li>• to explain nontechnical items to auditorium with technical background knowledge.</li> </ul> <p><b>Personal Competences (Self-reliance)</b></p> <p>Students are able in selected areas</p> <ul style="list-style-type: none"> <li>• to reflect on their own profession and professionalism in the context of real-life fields of application</li> <li>• to organize themselves and their own learning processes</li> <li>• to reflect and decide questions in front of a broad education background</li> <li>• to communicate a nontechnical item in a competent way in written form or verbally</li> <li>• to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)</li> </ul> |

## Module M0547: Electrical Engineering II: Alternating Current Networks and Basic Devices

### Courses

| Title   | Typ                | Hrs/wk    | CP |
|---|--------------------|-----------|----|
| Electrical Engineering II: Alternating Current Networks and Basic Devices (L0178) | Lecture            | 3         | 5  |
| Electrical Engineering II: Alternating Current Networks and Basic Devices (L0179) | Recitation (small) | Section 2 | 1  |

|                           |                        |
|---------------------------|------------------------|
| <b>Module Responsible</b> | Prof. Christian Becker |
|---------------------------|------------------------|

|                               |      |
|-------------------------------|------|
| <b>Admission Requirements</b> | None |
|-------------------------------|------|

|                                       |  |
|---------------------------------------|--|
| <b>Recommended Previous Knowledge</b> | <p>Electrical Engineering I</p> <p>Mathematics I</p> <p>Direct current networks, complex numbers</p> |
|---------------------------------------|--|

|                               |  |
|-------------------------------|--|
| <b>Educational Objectives</b> | After taking part successfully, students have reached the following learning results |
|-------------------------------|--|

|                                |   |
|--------------------------------|---|
| <b>Professional Competence</b> |   |
| <i>Knowledge</i>               | Students are able to reproduce and explain fundamental theories, principles, and methods related to the theory of alternating currents. They can describe networks of linear elements using a complex notation for voltages and currents. They can reproduce an overview of applications for the theory of alternating currents in the area of electrical engineering. Students are capable of explaining the behavior of fundamental passive and active devices as well as their impact on simple circuits.  |
| <i>Skills</i>                  | Students are capable of calculating parameters within simple electrical networks at alternating currents by means of a complex notation for voltages and currents. They can appraise the fundamental effects that may occur within electrical networks at alternating currents. Students are able to analyze simple circuits such as oscillating circuits, filter, and matching networks quantitatively and dimension elements by means of a design. They can motivate and justify the fundamental elements of an electrical power supply (transformer, transmission line, compensation of reactive power, multiphase system) and are qualified to dimension their main features. |
| <b>Personal Competence</b>     |   |
| <i>Social Competence</i>       | Students are able to work together on subject related tasks in small groups. They are able to present their results effectively.  |
| <i>Autonomy</i>                | Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as online-tests and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of other lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).  |

| <b>Workload in Hours</b>                      | Independent Study Time 110, Study Time in Lecture 70  |                   |                    |             |                    |    |      |         |  |
|---|---|-------------------|--------------------|-------------|--------------------|----|------|---------|--|
| <b>Credit points</b>                          | 6   |                   |                    |             |                    |    |      |         |  |

## Module M0624: Automata Theory and Formal Languages

### Courses

| Title  | Typ                | Hrs/wk    | CP |
|--|--------------------|-----------|----|
| Automata Theory and Formal Languages (L0332) | Lecture            | 2         | 4  |
| Automata Theory and Formal Languages (L0507) | Recitation (small) | Section 2 | 2  |

|                           |                    |
|---------------------------|--------------------|
| <b>Module Responsible</b> | Prof. Tobias Knopp |
|---------------------------|--------------------|

|                               |      |
|-------------------------------|------|
| <b>Admission Requirements</b> | None |
|-------------------------------|------|

|                                       |  |
|---------------------------------------|--|
| <b>Recommended Previous Knowledge</b> | <p>Participating students should be able to</p> <ul style="list-style-type: none"> <li>- specify algorithms for simple data structures (such as, e.g., arrays) to solve computational problems</li> <li>- apply propositional logic and predicate logic for specifying and understanding mathematical proofs</li> <li>- apply the knowledge and skills taught in the module Discrete Algebraic Structures</li> </ul> |
|---------------------------------------|--|

|                               |  |
|-------------------------------|--|
| <b>Educational Objectives</b> | After taking part successfully, students have reached the following learning results |
|-------------------------------|--|

|                                |  |
|--------------------------------|--|
| <b>Professional Competence</b> | <p>Students can explain syntax, semantics, and decision problems of propositional logic, and they are able to give algorithms for solving decision problems. Students can show correspondences to Boolean algebra. Students can describe which application problems are hard to represent with propositional logic, and therefore, the students can motivate predicate logic, and define syntax, semantics, and decision problems for this representation formalism. Students can explain unification and resolution for solving the predicate logic SAT decision problem. Students can also describe syntax, semantics, and decision problems for various kinds of temporal logic, and identify their application areas. The participants of the course can define various kinds of finite automata and can identify relationships to logic and formal grammars. The spectrum that students can explain ranges from deterministic and nondeterministic finite automata and pushdown automata to Turing machines. Students can name those formalism for which nondeterminism is more expressive than determinism. They are also able to demonstrate which decision problems require which expressivity, and, in addition, students can transform decision problems w.r.t. one formalism into decision problems w.r.t. other formalisms. They understand that some formalisms easily induce algorithms whereas others are best suited for specifying systems and their properties. Students can describe the relationships between formalisms such as logic, automata, or grammars.</p> |
| <i>Knowledge</i>               |  |
| <i>Skills</i>                  | <p>Students can apply propositional logic as well as predicate logic resolution to a given set of formulas. Students analyze application problems in order to derive propositional logic, predicate logic, or temporal logic formulas to represent them. They can evaluate which formalism is best suited for a particular application problem, and they can demonstrate the application of algorithms for decision problems to specific formulas. Students can also transform nondeterministic automata into deterministic ones, or derive grammars from automata and vice versa. They can show how parsers work, and they can apply algorithms for the language emptiness problem in case of infinite words.</p>   |

| <b>Language</b>                          | DE  |
| <b>Cycle</b>                             | WiSe/SoSe   |
| <b>Content</b>                           | <p>In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.</p> <p>If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on self-selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the business knowledge from the lecture should come to practical use. The group projects are guided by a mentor.</p> |

## Module M0851: Mathematics II

### Courses

| Title                     | Typ                | Hrs/wk    | CP |
|---------------------------|--------------------|-----------|----|
| Analysis II (L1025)       | Lecture            | 2         | 2  |
| Analysis II (L1026)       | Recitation (large) | Section 1 | 1  |
| Analysis II (L1027)       | Recitation (small) | Section 1 | 1  |
| Linear Algebra II (L0915) | Lecture            | 2         | 2  |
| Linear Algebra II (L0916) | Recitation (small) | Section 1 | 1  |
| Linear Algebra II (L0917) | Recitation (large) | Section 1 | 1  |

|                                       |   |
|---------------------------------------|---|
| <b>Module Responsible</b>             | Prof. Anusch Taraz  |
| <b>Admission Requirements</b>         | None  |
| <b>Recommended Previous Knowledge</b> | Mathematics I   |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |
| <b>Professional Competence</b>        |   |
| <i>Knowledge</i>                      | <ul style="list-style-type: none"> <li>• Students can name further concepts in analysis and linear algebra. They are able to explain them using appropriate examples.</li> <li>• Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.</li> <li>• They know proof strategies and can reproduce them.</li> </ul>  |
| <i>Skills</i>                         | <ul style="list-style-type: none"> <li>• Students can model problems in analysis and linear algebra with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.</li> <li>• Students are able to discover and verify further logical connections between the concepts studied in the course.</li> <li>• For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.</li> </ul> |
| <b>Personal Competence</b>            |   |
| <i>Social Competence</i>              | <ul style="list-style-type: none"> <li>• Students are able to work together in teams. They are capable to use mathematics as a common language.</li> <li>• In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.</li> </ul>   |
| <i>Autonomy</i>                       | <ul style="list-style-type: none"> <li>• Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</li> <li>• Students have developed sufficient persistence to be able to work for longer</li> </ul>  |

| <b>Admission Requirements</b>                 | None   |               |           |  |
| <b>Recommended Previous Knowledge</b>         | Lecture on procedural programming or equivalent programming skills   |               |           |  |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |               |           |  |
| <b>Professional Competence</b>                |  |               |           |  |
| <i>Knowledge</i>                              | The students have a fundamental understanding of object orientated and generic programming and can apply it in small programming projects. They can design own class hierarchies and differentiate between different ways of inheritance. They have a fundamental understanding of polymorphism and can differentiate between run-time and compile-time polymorphism. The students know the concept of information hiding and can design interfaces with public and private methods. They can use exceptions and apply generic programming in order to make existing data structures generic. The students know the pros and cons of both programming paradigms. |               |           |  |
| <i>Skills</i>                                 | Students can break down a medium-sized problem into subproblems and create their own classes in an object-oriented programming language based on these subproblems. They can design a public and private interface and implement the implementation generically and extensible by abstraction. They can distinguish different language constructs of a modern programming language and use these suitably in the implementation. They can design and implement unit tests.   |               |           |  |
| <b>Personal Competence</b>                    |  |               |           |  |
| <i>Social Competence</i>                      | Students can work in teams and communicate in forums.  |               |           |  |
| <i>Autonomy</i>                               | In a programming internship, students learn object-oriented programming under supervision. In exercises they develop individual and independent solutions and receive feedback.  |               |           |  |
| <b>Workload in Hours</b>                      | Independent Study Time 110, Study Time in Lecture 70   |               |           |  |
| <b>Credit points</b>                          | 6  |               |           |  |
| <b>Course achievement</b>                     | None   |               |           |  |
| <b>Examination</b>                            | Written exam   |               |           |  |
| <b>Examination duration and scale</b>         | 90 min   |               |           |  |

| <b>Lecturer</b>  | Prof. Andreas Timm-Giel, Prof. Dieter Gollmann  |
| <b>Language</b>  | EN  |
| <b>Cycle</b>   | WiSe  |
| <b>Content</b>   | <p>In this class an introduction to computer networks with focus on the Internet and its security is given. Basic functionality of complex protocols are introduced. Students learn to understand these and identify common principles. In the exercises these basic principles and an introduction to performance modelling are addressed using computing tasks and (virtual) labs.</p> <p>In the second part of the lecture an introduction to Internet security is given.</p> <p>This class comprises:</p> <ul style="list-style-type: none"> <li>• Application layer protocols (HTTP, FTP, DNS)</li> <li>• Transport layer protocols (TCP, UDP)</li> <li>• Network Layer (Internet Protocol, routing in the Internet)</li> <li>• Data link layer with media access at the example of Ethernet</li> <li>• Multimedia applications in the Internet</li> <li>• Network management</li> <li>• Internet security: IPSec</li> <li>• Internet security: Firewalls</li> </ul> |
| <b>Literature</b>  | <ul style="list-style-type: none"> <li>• Kurose, Ross, Computer Networking - A Top-Down Approach, 6th Edition, Addison-Wesley</li> <li>• Kurose, Ross, Computernetzwerke - Der Top-Down-Ansatz, Pearson Studium; Auflage: 6. Auflage</li> <li>• W. Stallings: Cryptography and Network Security: Principles and Practice, 6th edition</li> </ul> <p>Further literature is announced at the beginning of the lecture.</p>  |

| Module M0730: Computer Engineering    |  |           |    |  |
|---------------------------------------|--|-----------|----|--|
| Courses                               |  |           |    |  |
| Title                                 | Typ  | Hrs/wk    | CP |  |
| Computer Engineering (L0321)          | Lecture  | 3         | 4  |  |
| Computer Engineering (L0324)          | Recitation (small)   | Section 1 | 2  |  |
| <b>Module Responsible</b>             | Prof. Heiko Falk   |           |    |  |
| <b>Admission Requirements</b>         | None   |           |    |  |
| <b>Recommended Previous Knowledge</b> | Basic knowledge in electrical engineering  |           |    |  |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |           |    |  |
| <b>Professional Competence</b>        | <p>This module deals with the foundations of the functionality of computing systems. It covers the layers from the assembly-level programming down to gates. The module includes the following topics:</p> <ul style="list-style-type: none"> <li>• Introduction</li> <li>• Combinational logic: Gates, Boolean algebra, Boolean functions, hardware synthesis, combinational networks</li> <li>• Sequential logic: Flip-flops, automata, systematic hardware design</li> <li>• Technological foundations</li> <li>• Computer arithmetic: Integer addition, subtraction, multiplication and division</li> <li>• Basics of computer architecture: Programming models, MIPS single-cycle architecture, pipelining</li> <li>• Memories: Memory hierarchies, SRAM, DRAM, caches</li> <li>• Input/output: I/O from the perspective of the CPU, principles of passing data, point-to-point connections, busses</li> </ul>  |           |    |  |
| <i>Knowledge</i>                      |  |           |    |  |
| <i>Skills</i>                         | <p>The students perceive computer systems from the architect's perspective, i.e., they identify the internal structure and the physical composition of computer systems. The students can analyze, how highly specific and individual computers can be built based on a collection of few and simple components. They are able to distinguish between and to explain the different abstraction layers of today's computing systems - from gates and circuits up to complete processors.</p> <p>After successful completion of the module, the students are able to judge the interdependencies between a physical computer system and the software executed on it. In particular, they shall understand the consequences that the execution of software has on the hardware-centric abstraction layers from the assembly language down to gates. This way, they will be enabled to evaluate the impact that these low abstraction levels have on an entire system's performance and to propose feasible options.</p> |           |    |  |
| <b>Personal Competence</b>            |  |           |    |  |
| <i>Social Competence</i>              | Students are able to solve similar problems alone or in a group and to present the results accordingly.  |           |    |  |
| <i>Autonomy</i>                       | Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.  |           |    |  |
| <b>Workload in Hours</b>              | Independent Study Time 124, Study Time in Lecture 56   |           |    |  |

## Module M0853: Mathematics III

### Courses

| Title  | Typ                | Hrs/wk    | CP |
|--|--------------------|-----------|----|
| Analysis III (L1028)   | Lecture            | 2         | 2  |
| Analysis III (L1029)   | Recitation (small) | Section 1 | 1  |
| Analysis III (L1030)   | Recitation (large) | Section 1 | 1  |
| Differential Equations 1 (Ordinary Differential Equations) (L1031) | Lecture            | 2         | 2  |
| Differential Equations 1 (Ordinary Differential Equations) (L1032) | Recitation (small) | Section 1 | 1  |
| Differential Equations 1 (Ordinary Differential Equations) (L1033) | Recitation (large) | Section 1 | 1  |

|                                       |   |
|---------------------------------------|---|
| <b>Module Responsible</b>             | Prof. Anusch Taraz  |
| <b>Admission Requirements</b>         | None  |
| <b>Recommended Previous Knowledge</b> | Mathematics I + II  |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |
| <b>Professional Competence</b>        | <ul style="list-style-type: none"> <li>Students can name the basic concepts in the area of analysis and differential equations. They are able to explain them using appropriate examples.</li> <li>Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.</li> <li>They know proof strategies and can reproduce them.</li> </ul><br><ul style="list-style-type: none"> <li>Students can model problems in the area of analysis and differential equations with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.</li> <li>Students are able to discover and verify further logical connections between the concepts studied in the course.</li> <li>For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.</li> </ul> |
| <i>Knowledge</i>                      |   |
| <i>Skills</i>                         |   |
| <b>Personal Competence</b>            |   |
| <i>Social Competence</i>              | <ul style="list-style-type: none"> <li>Students are able to work together in teams. They are capable to use mathematics as a common language.</li> <li>In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.</li> </ul>   |
| <i>Autonomy</i>                       | <ul style="list-style-type: none"> <li>Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</li> <li>Students have developed sufficient persistence to be able to work for longer</li> </ul>  |

|   |   |
|---|---|
|   | periods in a goal-oriented manner on hard problems.   |
| <b>Workload in Hours</b>                      | Independent Study Time 128, Study Time in Lecture 112   |
| <b>Credit points</b>                          | 8   |
| <b>Course achievement</b>                     | None  |
| <b>Examination</b>                            | Written exam  |
| <b>Examination duration and scale</b>         | 60 min (Analysis III) + 60 min (Differential Equations 1)   |
| <b>Assignment for the Following Curricula</b> | <p>General Engineering Science (German program, 7 semester): Core qualification: Compulsory</p> <p>Civil- and Environmental Engineering: Core qualification: Compulsory</p> <p>Bioprocess Engineering: Core qualification: Compulsory</p> <p>Computer Science: Core qualification: Compulsory</p> <p>Data Science: Core qualification: Compulsory</p> <p>Digital Mechanical Engineering: Core qualification: Compulsory</p> <p>Electrical Engineering: Core qualification: Compulsory</p> <p>Energy and Environmental Engineering: Core qualification: Compulsory</p> <p>Engineering Science: Core qualification: Compulsory</p> <p>General Engineering Science (English program, 7 semester): Core qualification: Compulsory</p> <p>Computational Science and Engineering: Core qualification: Compulsory</p> <p>Mechanical Engineering: Core qualification: Compulsory</p> <p>Mechatronics: Core qualification: Compulsory</p> <p>Naval Architecture: Core qualification: Compulsory</p> <p>Process Engineering: Core qualification: Compulsory</p> |

## Module M0672: Signals and Systems

### Courses

| Title                       | Typ                | Hrs/wk    | CP |
|-----------------------------|--------------------|-----------|----|
| Signals and Systems (L0432) | Lecture            | 3         | 4  |
| Signals and Systems (L0433) | Recitation (small) | Section 2 | 2  |

|                                       |   |
|---------------------------------------|---|
| <b>Module Responsible</b>             | Prof. Gerhard Bauch   |
| <b>Admission Requirements</b>         | None  |
| <b>Recommended Previous Knowledge</b> | Mathematics 1-3<br>The modul is an introduction to the theory of signals and systems. Good knowledge in maths as covered by the modul Mathematik 1-3 is expected. Further experience with spectral transformations (Fourier series, Fourier transform, Laplace transform) is useful but not required.   |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |
| <b>Professional Competence</b>        |   |
| <i>Knowledge</i>                      | The students are able to classify and describe signals and linear time-invariant (LTI) systems using methods of signal and system theory. They are able to apply the fundamental transformations of continuous-time and discrete-time signals and systems. They can describe and analyse deterministic signals and systems mathematically in both time and image domain. In particular, they understand the effects in time domain and image domain which are caused by the transition of a continuous-time signal to a discrete-time signal. |
| <i>Skills</i>                         | The students are able to describe and analyse deterministic signals and linear time-invariant systems using methods of signal and system theory. They can analyse and design basic systems regarding important properties such as magnitude and phase response, stability, linearity etc.. They can assess the impact of LTI systems on the signal properties in time and frequency domain.   |
| <b>Personal Competence</b>            |   |
| <i>Social Competence</i>              | The students can jointly solve specific problems.   |
| <i>Autonomy</i>                       | The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.  |
| <b>Workload in Hours</b>              | Independent Study Time 110, Study Time in Lecture 70  |
| <b>Credit points</b>                  | 6   |
| <b>Course achievement</b>             | None  |
| <b>Examination</b>                    | Written exam  |
| <b>Examination duration and scale</b> | 90 min  |

## Module M0803: Embedded Systems

### Courses

| Title                                 | Typ  | Hrs/wk               | CP  |
|---------------------------------------|--|----------------------|---|
| Embedded Systems (L0805)              | Lecture  | 3                    | 4   |
| Embedded Systems (L0806)              | Recitation (small)   | Section 1            | 2   |
| <b>Module Responsible</b>             | Prof. Heiko Falk   |                      |   |
| <b>Admission Requirements</b>         | None   |                      |   |
| <b>Recommended Previous Knowledge</b> | Computer Engineering   |                      |   |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |                      |   |
| <b>Professional Competence</b>        | <p>Embedded systems can be defined as information processing systems embedded into enclosing products. This course teaches the foundations of such systems. In particular, it deals with an introduction into these systems (notions, common characteristics) and their specification languages (models of computation, hierarchical automata, specification of distributed systems, task graphs, specification of real-time applications, translations between different models).</p> <p><i>Knowledge</i> Another part covers the hardware of embedded systems: Sensors, A/D and D/A converters, real-time capable communication hardware, embedded processors, memories, energy dissipation, reconfigurable logic and actuators. The course also features an introduction into real-time operating systems, middleware and real-time scheduling. Finally, the implementation of embedded systems using hardware/software co-design (hardware/software partitioning, high-level transformations of specifications, energy-efficient realizations, compilers for embedded processors) is covered.</p> <p><i>Skills</i> After having attended the course, students shall be able to realize simple embedded systems. The students shall realize which relevant parts of technological competences to use in order to obtain a functional embedded systems. In particular, they shall be able to compare different models of computations and feasible techniques for system-level design. They shall be able to judge in which areas of embedded system design specific risks exist.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> Students are able to solve similar problems alone or in a group and to present the results accordingly.</p> <p><i>Autonomy</i> Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.</p> |                      |   |
| <b>Workload in Hours</b>              | Independent Study Time 124, Study Time in Lecture 56   |                      |   |

| Stochastics (L0777)                   | Lecture  | 2         | 4  |
| Stochastics (L0778)                   | Recitation (small)   | Section 2 | 2  |
| <b>Module Responsible</b>             | Prof. Marko Lindner  |           |    |
| <b>Admission Requirements</b>         | None   |           |    |
| <b>Recommended Previous Knowledge</b> | <ul style="list-style-type: none"> <li>• Calculus</li> <li>• Discrete algebraic structures (combinatorics)</li> <li>• Propositional logic</li> </ul>   |           |    |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |           |    |
| <b>Professional Competence</b>        | <p><i>Knowledge</i> Students can explain the main definitions of probability, and they can give basic definitions of modeling elements (random variables, events, dependence, independence assumptions) used in discrete and continuous settings (joint and marginal distributions, density functions). Students can describe characteristic notions such as expected values, variance, standard deviation, and moments.</p> <p>Students can define decision problems and explain algorithms for solving these problems (based on the chain rule or Bayesian networks). Algorithms, or estimators as they are called, can be analyzed in terms of notions such as bias of an estimator, etc. Student can describe the main ideas of stochastic processes and explain algorithms for solving decision and computation problem for stochastic processes. Students can also explain basic statistical detection and estimation techniques.</p> <p><i>Skills</i> Students can apply algorithms for solving decision problems, and they can justify whether approximation techniques are good enough in various application contexts, i.e., students can derive estimators and judge whether they are applicable or reliable.</p> |           |    |
| <b>Personal Competence</b>            | <p><i>Social Competence</i> - Students are able to work together (e.g. on their regular home work) in heterogeneously composed teams (i.e., teams from different study programs and background knowledge) and to present their results appropriately (e.g. during exercise class).</p> <p><i>Autonomy</i> - Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</p> <p>- Students can put their knowledge in relation to the contents of other lectures.</p> <p>- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.</p>  |           |    |
| <b>Workload in Hours</b>              | Independent Study Time 124, Study Time in Lecture 56   |           |    |
| <b>Credit points</b>                  | 6  |           |    |

## Module M0675: Introduction to Communications and Random Processes

| <b>Courses</b>  |   |               |           |  |
|---|---|---------------|-----------|--|
| <b>Title</b>  | <b>Typ</b>  | <b>Hrs/wk</b> | <b>CP</b> |  |
| Introduction to Communications and Random Processes (L0442) | Lecture   | 3             | 4         |  |
| Introduction to Communications and Random Processes (L0443) | Recitation (large)  | Section 1     | 1         |  |
| Introduction to Communications and Random Processes (L2354) | Recitation (small)  | Section 1     | 1         |  |
| <b>Module Responsible</b>                                   | Prof. Gerhard Bauch   |               |           |  |
| <b>Admission Requirements</b>                               | None  |               |           |  |
| <b>Recommended Previous Knowledge</b>                       | <ul style="list-style-type: none"> <li>Mathematics 1-3</li> <li>Signals and Systems</li> </ul>  |               |           |  |
| <b>Educational Objectives</b>                               | After taking part successfully, students have reached the following learning results  |               |           |  |
| <b>Professional Competence</b>                              | <p><i>Knowledge</i> The students know and understand the fundamental building blocks of a communications system. They can describe and analyse the individual building blocks using knowledge of signal and system theory as well as the theory of stochastic processes. They are aware of the essential resources and evaluation criteria of information transmission and are able to design and evaluate a basic communications system.</p> <p><i>Skills</i> The students are able to design and evaluate a basic communications system. In particular, they can estimate the required resources in terms of bandwidth and power. They are able to assess essential evaluation parameters of a basic communications system such as bandwidth efficiency or bit error rate and to decide for a suitable transmission method.</p> <p><b>Personal Competence</b></p> <p><i>Social Competence</i> The students can jointly solve specific problems.</p> <p><i>Autonomy</i> The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems, software tools, clicker system.</p> |               |           |  |
| <b>Workload in Hours</b>                                    | Independent Study Time 110, Study Time in Lecture 70  |               |           |  |

| <b>Module M1431: Practical Course IIW</b>     |   |               |           |  |
|---|---|---------------|-----------|--|
| <b>Courses</b>                                |   |               |           |  |
| <b>Title</b>                                  | <b>Typ</b>  | <b>Hrs/wk</b> | <b>CP</b> |  |
| Practical Course IIW (L2160)                  | Practical Course  | 4             | 6         |  |
| <b>Module Responsible</b>                     | Prof. Görschwin Fey   |               |           |  |
| <b>Admission Requirements</b>                 | None  |               |           |  |
| <b>Recommended Previous Knowledge</b>         | Successful participation in the modules: <ul style="list-style-type: none"> <li>• Procedural Programming</li> <li>• Algorithms and Data Structures</li> <li>• Embedded Systems</li> <li>• Computer Engineering</li> </ul>   |               |           |  |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results  |               |           |  |
| <b>Professional Competence</b>                | Students get to know tools used by development teams to <ul style="list-style-type: none"> <li>• plan development flows,</li> <li>• manage task distribution,</li> <li>• manage source code, and</li> <li>• test software.</li> </ul>   |               |           |  |
| <i>Knowledge</i>                              |   |               |           |  |
| <i>Skills</i>                                 | Students work in teams on a larger project. The required competences are learned and practically applied. These are for example: <ul style="list-style-type: none"> <li>• specifying software based on user requirements</li> <li>• creating a software architecture</li> <li>• implementing and testing software in a team, and</li> <li>• using the related development tools.</li> </ul> |               |           |  |
| <b>Personal Competence</b>                    |   |               |           |  |
| <i>Social Competence</i>                      | Team work has its own challenges with respect to interaction of team members as well as finding the necessary agreement during joint software development. During the project students learn the required competences and experience the practical needs.   |               |           |  |
| <i>Autonomy</i>                               | During team work it is mandatory to take and explain a certain position, to independently complete assigned tasks, and to present results to the team. Open issues must be identified and returned into the team to find an agreed resolution.  |               |           |  |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56  |               |           |  |
| <b>Credit points</b>                          | 6   |               |           |  |
| <b>Course achievement</b>                     | None  |               |           |  |
| <b>Examination</b>                            | Subject theoretical and practical work  |               |           |  |
| <b>Examination duration and scale</b>         | Evaluation of engagement, project report and final presentation   |               |           |  |
| <b>Assignment for the Following Curricula</b> | Computational Science and Engineering: Core qualification: Compulsory   |               |           |  |

| <b>CP</b>                                 | 6   |
| <b>Workload in Hours</b>                  | Independent Study Time 124, Study Time in Lecture 56  |
| <b>Lecturer</b>                           | NN, Dozenten des SD E   |
| <b>Language</b>                           | DE/EN   |
| <b>Cycle</b>                              | WiSe  |
| <b>Content</b>                            | <p>A software program, an embedded system or cyber physical system is developed during the course of the project. The respective lecturer provides the concrete task description. Participating students work as a team to solve the task. This induces a typical project flow as it occurs in enterprises as well. Typical steps like defining a specification, creating a hardware-software-architecture as well as implementation and testing are mandatory. Students are also responsible for project planning, defining and assigning sub tasks to team members. Common development tools supporting planning, management and realization are used within the project.</p> <p>The total of 8 hours per week of the semester (SWS) splits into a weekly plenary session of ca. 2 SWS and group work of ca. 6 SWS.</p> |
| <b>Literature</b>                         | <p>Wird durch die jeweiligen DozentInnen zur Verfügung gestellt.</p> <p>Supplied by the respective lecturer.</p>  |

## Module M0833: Introduction to Control Systems

### Courses

| Title                                   | Typ                | Hrs/wk    | CP |
|---|--------------------|-----------|----|
| Introduction to Control Systems (L0654) | Lecture            | 2         | 4  |
| Introduction to Control Systems (L0655) | Recitation (small) | Section 2 | 2  |

|                                       |  |
|---------------------------------------|--|
| <b>Module Responsible</b>             | Prof. Herbert Werner   |
| <b>Admission Requirements</b>         | None   |
| <b>Recommended Previous Knowledge</b> | Representation of signals and systems in time and frequency domain, Laplace transform  |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |
| <b>Professional Competence</b>        |  |
| <i>Knowledge</i>                      | <ul style="list-style-type: none"> <li>• Students can represent dynamic system behavior in time and frequency domain, and can in particular explain properties of first and second order systems</li> <li>• They can explain the dynamics of simple control loops and interpret dynamic properties in terms of frequency response and root locus</li> <li>• They can explain the Nyquist stability criterion and the stability margins derived from it.</li> <li>• They can explain the role of the phase margin in analysis and synthesis of control loops</li> <li>• They can explain the way a PID controller affects a control loop in terms of its frequency response</li> <li>• They can explain issues arising when controllers designed in continuous time domain are implemented digitally</li> </ul> |
| <i>Skills</i>                         | <ul style="list-style-type: none"> <li>• Students can transform models of linear dynamic systems from time to frequency domain and vice versa</li> <li>• They can simulate and assess the behavior of systems and control loops</li> <li>• They can design PID controllers with the help of heuristic (Ziegler-Nichols) tuning rules</li> <li>• They can analyze and synthesize simple control loops with the help of root locus and frequency response techniques</li> <li>• They can calculate discrete-time approximations of controllers designed in continuous-time and use it for digital implementation</li> <li>• They can use standard software tools (Matlab Control Toolbox, Simulink) for carrying out these tasks</li> </ul>  |
| <b>Personal Competence</b>            |  |
| <i>Social Competence</i>              | <p>Students can work in small groups to jointly solve technical problems, and experimentally validate their controller designs</p> <p>Students can obtain information from provided sources (lecture notes, software documentation, experiment guides) and use it when solving given problems.</p>   |
| <i>Autonomy</i>                       | They can assess their knowledge in weekly on-line tests and thereby control their learning progress.   |

## Specialization I. Computer Science

### Module M0731: Functional Programming

#### Courses

| Title                                 | Typ  | Hrs/wk       | CP          |
|---------------------------------------|--|--------------|-------------|
| Functional Programming (L0624)        | Lecture  | 2            | 2           |
| Functional Programming (L0625)        | Recitation (large)   | Section 2    | 2           |
| Functional Programming (L0626)        | Recitation (small)   | Section 2    | 2           |
| <b>Module Responsible</b>             | Prof. Sibylle Schupp   |              |             |
| <b>Admission Requirements</b>         | None   |              |             |
| <b>Recommended Previous Knowledge</b> | Discrete mathematics at high-school level  |              |             |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |              |             |
| <b>Professional Competence</b>        | <p><i>Knowledge</i></p> <p>Students apply the principles, constructs, and simple design techniques of functional programming. They demonstrate their ability to read Haskell programs and to explain Haskell syntax as well as Haskell's read-eval-print loop. They interpret warnings and find errors in programs. They apply the fundamental data structures, data types, and type constructors. They employ strategies for unit tests of functions and simple proof techniques for partial and total correctness. They distinguish laziness from other evaluation strategies.</p> <p><i>Skills</i></p> <p>Students break a natural-language description down in parts amenable to a formal specification and develop a functional program in a structured way. They assess different language constructs, make conscious selections both at specification and implementations level, and justify their choice. They analyze given programs and rewrite them in a controlled way. They design and implement unit tests and can assess the quality of their tests. They argue for the correctness of their program.</p> |              |             |
| <b>Personal Competence</b>            | <p><i>Social Competence</i></p> <p>Students practice peer programming with varying peers. They explain problems and solutions to their peer. They defend their programs orally. They communicate in English.</p> <p><i>Autonomy</i></p> <p>In programming labs, students learn under supervision (a.k.a. "Betreutes Programmieren") the mechanics of programming. In exercises, they develop solutions individually and independently, and receive feedback.</p>   |              |             |
| <b>Workload in Hours</b>              | Independent Study Time 96, Study Time in Lecture 84  |              |             |
| <b>Credit points</b>                  | 6  |              |             |
| <b>Course achievement</b>             | <b>Compulsory</b>  | <b>Bonus</b> | <b>Form</b> |
|                                       | Yes  | 15 %         | Excercises  |
| <b>Examination</b>                    | Written exam   |              |             |
| <b>Examination duration and scale</b> | 90 min   |              |             |
|                                       | General Engineering Science (German program, 7 semester): Specialisation   |              |             |

| Distributed Systems (L1155)                   |  | Lecture            | 2             | 3         |
| Distributed Systems (L1156)                   |  | Recitation (small) | Section 2     | 3         |
| <b>Module Responsible</b>                     | Prof. Volker Turau   |                    |               |           |
| <b>Admission Requirements</b>                 | None   |                    |               |           |
| <b>Recommended Previous Knowledge</b>         | <ul style="list-style-type: none"> <li>• Procedural programming</li> <li>• Object-oriented programming with Java</li> <li>• Networks</li> <li>• Socket programming</li> </ul>  |                    |               |           |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |                    |               |           |
| <b>Professional Competence</b>                |  |                    |               |           |
| <i>Knowledge</i>                              | Students explain the main abstractions of Distributed Systems (Marshalling, proxy, service, address, Remote procedure call, synchron/asynchron system). They describe the pros and cons of different types of interprocess communication. They give examples of existing middleware solutions. The participants of the course know the main architectural variants of distributed systems, including their pros and cons. Students can describe at least three different synchronization mechanisms. |                    |               |           |
| <i>Skills</i>                                 | Students can realize distributed systems using at least three different techniques: <ul style="list-style-type: none"> <li>• Proprietary protocol realized with TCP</li> <li>• HTTP as a remote procedure call</li> <li>• RMI as a middleware</li> </ul>   |                    |               |           |
| <b>Personal Competence</b>                    |  |                    |               |           |
| <i>Social Competence</i>                      |  |                    |               |           |
| <i>Autonomy</i>                               |  |                    |               |           |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56   |                    |               |           |
| <b>Credit points</b>                          | 6  |                    |               |           |

| <b>Admission Requirements</b>         | None   |                                 |  |                    |
| <b>Recommended Previous Knowledge</b> | Module "Computer Engineering"  |                                 |  |                    |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |                                 |  |                    |
| <b>Professional Competence</b>        |  |                                 |  |                    |
| <i>Knowledge</i>                      | This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for general-purpose computers and for special-purpose machines (e.g., signal processors). Next, foundational aspects of the micro-architecture of processors are covered. Here, the focus particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies. |                                 |  |                    |
| <i>Skills</i>                         | The students are able to describe the organization of processors. They know the different architectural principles and programming models. The students examine various structures of pipelined processor architectures and are able to explain their concepts and to analyze them w.r.t. criteria like, e.g., performance or energy efficiency. They evaluate different structures of memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism.   |                                 |  |                    |
| <b>Personal Competence</b>            |  |                                 |  |                    |
| <i>Social Competence</i>              | Students are able to solve similar problems alone or in a group and to present the results accordingly.  |                                 |  |                    |
| <i>Autonomy</i>                       | Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.  |                                 |  |                    |
| <b>Workload in Hours</b>              | Independent Study Time 110, Study Time in Lecture 70   |                                 |  |                    |
| <b>Credit points</b>                  | 6  |                                 |  |                    |
| <b>Course achievement</b>             | <b>Compulsory</b>  | <b>Bonus</b>                    | <b>Form</b>                            | <b>Description</b> |
|                                       | No   | 15 %                            | Subject theoretical and practical work |                    |
| <b>Examination</b>                    | Written exam   |                                 |  |                    |
| <b>Examination duration and scale</b> | 90 minutes, contents of course and 4 attestations from the PBL "Computer architecture"   |                                 |  |                    |

## Module M0562: Computability and Complexity Theory

| <b>Courses</b>                                |  |               |           |
|---|--|---------------|-----------|
| <b>Title</b>                                  | <b>Typ</b>   | <b>Hrs/wk</b> | <b>CP</b> |
| Computability and Complexity Theory (L0166)   | Lecture  | 2             | 3         |
| Computability and Complexity Theory (L0167)   | Recitation (small)   | Section 2     | 3         |
| <b>Module Responsible</b>                     | Prof. Karl-Heinz Zimmermann  |               |           |
| <b>Admission Requirements</b>                 | None   |               |           |
| <b>Recommended Previous Knowledge</b>         | Discrete Algebraic Structures, Automata Theory, Logic, and Formal Language Theory.   |               |           |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |               |           |
| <b>Professional Competence</b>                | The students know the important machine models of computability, the class of partial recursive functions, universal computability, Gödel numbering of computations, the theorems of Kleene, Rice, and Rice-Shapiro, the concept of decidable and undecidable sets, the word problems for semi-Thue systems, Thue systems, semi-groups, and Post correspondence systems, Hilbert's 10-th problem, and the basic concepts of complexity theory.   |               |           |
| <i>Knowledge</i>                              |  |               |           |
| <i>Skills</i>                                 | Students are able to investigate the computability of sets and functions and to analyze the complexity of computable functions.  |               |           |
| <b>Personal Competence</b>                    |  |               |           |
| <i>Social Competence</i>                      | Students are able to solve specific problems alone or in a group and to present the results accordingly.   |               |           |
| <i>Autonomy</i>                               | Students are able to acquire new knowledge from newer literature and to associate the acquired knowledge with other classes.   |               |           |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56   |               |           |
| <b>Credit points</b>                          | 6  |               |           |
| <b>Course achievement</b>                     | None   |               |           |
| <b>Examination</b>                            | Written exam   |               |           |

| Operating Systems (L1154)                     | Recitation (small)   | Section 2     | 3         |
| <b>Module Responsible</b>                     | Prof. Volker Turau   |               |           |
| <b>Admission Requirements</b>                 | None   |               |           |
| <b>Recommended Previous Knowledge</b>         | <ul style="list-style-type: none"> <li>• Object-oriented programming, algorithms, and data structures</li> <li>• Procedural programming</li> <li>• Experience in using tools related to operating systems such as editors, linkers, compilers</li> <li>• Experience in using C-libraries</li> </ul>  |               |           |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |               |           |
| <b>Professional Competence</b>                |  |               |           |
| <i>Knowledge</i>                              | Students explain the main abstractions process, virtual memory, deadlock, lifelock, and file of operations systems, describe the process states and their transitions, and paraphrase the architectural variants of operating systems. They give examples of existing operating systems and explain their architectures. The participants of the course write concurrent programs using threads, conditional variables and semaphores. Students can describe the variants of realizing a file system. Students explain at least three different scheduling algorithms. |               |           |
| <i>Skills</i>                                 | Students are able to use the POSIX libraries for concurrent programming in a correct and efficient way. They are able to judge the efficiency of a scheduling algorithm for a given scheduling task in a given environment.  |               |           |
| <b>Personal Competence</b>                    |  |               |           |
| <i>Social Competence</i>                      |  |               |           |
| <i>Autonomy</i>                               |  |               |           |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56   |               |           |

| <b>Module Responsible</b>             | Prof. Sibylle Schupp  |                    |               |           |
| <b>Admission Requirements</b>         | None  |                    |               |           |
| <b>Recommended Previous Knowledge</b> | <ul style="list-style-type: none"> <li>• Practical programming experience</li> <li>• Automata theory and formal languages</li> <li>• Functional programming or procedural programming</li> <li>• Object-oriented programming, algorithms, and data structures</li> <li>• Basic knowledge of software engineering</li> </ul>   |                    |               |           |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |                    |               |           |
| <b>Professional Competence</b>        |   |                    |               |           |
| <i>Knowledge</i>                      | Students explain the workings of a compiler and break down a compilation task in different phases. They apply and modify the major algorithms for compiler construction and code improvement. They can re-write those algorithms in a programming language, run and test them. They choose appropriate internal languages and representations and justify their choice. They explain and modify implementations of existing compiler frameworks and experiment with frameworks and tools. |                    |               |           |
| <i>Skills</i>                         | Students design and implement arbitrary compilation phases. They integrate their code in existing compiler frameworks. They organize their compiler code properly as a software project. They generalize algorithms for compiler construction to algorithms that analyze or synthesize software.  |                    |               |           |
| <b>Personal Competence</b>            |   |                    |               |           |
| <i>Social Competence</i>              | Students develop the software in a team. They explain problems and solutions to their team members. They present and defend their software in class. They communicate in English.   |                    |               |           |
| <i>Autonomy</i>                       | Students develop their software independently and define milestones by themselves. They receive feedback throughout the entire project. They organize the software project so that they can assess their progress themselves.   |                    |               |           |
| <b>Workload in Hours</b>              | Independent Study Time 124, Study Time in Lecture 56  |                    |               |           |
| <b>Credit points</b>                  | 6   |                    |               |           |
| <b>Course achievement</b>             | None  |                    |               |           |
| <b>Examination</b>                    | Subject theoretical and practical work  |                    |               |           |
| <b>Examination duration and scale</b> | Software (Compiler)   |                    |               |           |

| <b>Admission Requirements</b>                 | None   |                    |               |                    |
| <b>Recommended Previous Knowledge</b>         | <ul style="list-style-type: none"> <li>• Automata theory and formal languages</li> <li>• Procedural programming or Functional programming</li> <li>• Object-oriented programming, algorithms, and data structures</li> </ul>   |                    |               |                    |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |                    |               |                    |
| <b>Professional Competence</b>                |  |                    |               |                    |
| <i>Knowledge</i>                              | Students explain the phases of the software life cycle, describe the fundamental terminology and concepts of software engineering, and paraphrase the principles of structured software development. They give examples of software-engineering tasks of existing large-scale systems. They write test cases for different test strategies and devise specifications or models using different notations, and critique both. They explain simple design patterns and the major activities in requirements analysis, maintenance, and project planning. |                    |               |                    |
| <i>Skills</i>                                 | For a given task in the software life cycle, students identify the corresponding phase and select an appropriate method. They choose the proper approach for quality assurance. They design tests for realistic systems, assess the quality of the tests, and find errors at different levels. They apply and modify non-executable artifacts. They integrate components based on interface specifications.  |                    |               |                    |
| <b>Personal Competence</b>                    |  |                    |               |                    |
| <i>Social Competence</i>                      | Students practice peer programming. They explain problems and solutions to their peer. They communicate in English.  |                    |               |                    |
| <i>Autonomy</i>                               | Using on-line quizzes and accompanying material for self study, students can assess their level of knowledge continuously and adjust it appropriately. Working on exercise problems, they receive additional feedback.   |                    |               |                    |
| <b>Workload in Hours</b>                      | Independent Study Time 124, Study Time in Lecture 56   |                    |               |                    |
| <b>Credit points</b>                          | 6  |                    |               |                    |
| <b>Course achievement</b>                     | <b>Compulsory</b>  | <b>Bonus</b>       | <b>Form</b>   | <b>Description</b> |

## Module M1300: Software Development

### Courses

| Title                                 | Typ  | Hrs/wk | CP |
|---------------------------------------|--|--------|----|
| Software Development (L1790)          | Project-/problem-based Learning  | 2      | 5  |
| Software Development (L1789)          | Lecture  | 1      | 1  |
| <b>Module Responsible</b>             | Prof. Sibylle Schupp   |        |    |
| <b>Admission Requirements</b>         | None   |        |    |
| <b>Recommended Previous Knowledge</b> | <ul style="list-style-type: none"> <li>• Introduction to Software Engineering</li> <li>• Programming Skills</li> <li>• Experience with Developing Small to Medium-Size Programs</li> </ul>   |        |    |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |        |    |
| <b>Professional Competence</b>        |  |        |    |
| <i>Knowledge</i>                      | Students explain the fundamental concepts of agile methods, describe the process of test-driven development, and explain how continuous integration can be used in different scenarios. They give examples of selected pitfalls in software development, regarding scalability and other non-functional requirements. They write unit tests and build scripts and combine them in a corresponding integration environment. They explain major activities in requirements analysis, program comprehension, and agile project development. |        |    |
| <i>Skills</i>                         | For a given task on a legacy system, students identify the corresponding parts in the system and select an appropriate method for understanding the details. They choose the proper approach of splitting a task in independent testable and extensible pieces and, thus, solve the task with proper methods for quality assurance. They design tests for legacy systems, create automated builds, and find errors at different levels. They integrate the resulting artifacts in a continuous development environment                   |        |    |
| <b>Personal Competence</b>            |  |        |    |
| <i>Social Competence</i>              | Students discuss different design decisions in a group. They defend their solutions orally. They communicate in English.   |        |    |
| <i>Autonomy</i>                       | Using accompanying tools, students can assess their level of knowledge continuously and adjust it appropriately. Within limits, they can set their own learning goals. Upon successful completion, students can identify and formulate concrete problems of software systems and propose solutions. Within this field, they can conduct independent studies to acquire the necessary competencies. They can devise plans to arrive at new solutions or assess existing ones.   |        |    |
| <b>Workload in Hours</b>              | Independent Study Time 138, Study Time in Lecture 42   |        |    |

## Specialization II. Mathematics & Engineering Science

### Module M1235: Electrical Power Systems I: Introduction to Electrical Power Systems

**Courses**

| Title  | Typ                | Hrs/wk    | CP |
|--|--------------------|-----------|----|
| Electrical Power Systems I: Introduction to Electrical Power Systems (L1670) | Lecture            | 3         | 4  |
| Electrical Power Systems I: Introduction to Electrical Power Systems (L1671) | Recitation (large) | Section 2 | 2  |

|   |  |
|---|--|
| <b>Module Responsible</b>                     | Prof. Christian Becker   |
| <b>Admission Requirements</b>                 | None   |
| <b>Recommended Previous Knowledge</b>         | Fundamentals of Electrical Engineering   |
| <b>Educational Objectives</b>                 | After taking part successfully, students have reached the following learning results   |
| <b>Professional Competence</b>                |  |
| <i>Knowledge</i>                              | Students are able to give an overview of conventional and modern electric power systems. They can explain in detail and critically evaluate technologies of electric power generation, transmission, storage, and distribution as well as integration of equipment into electric power systems.  |
| <i>Skills</i>                                 | With completion of this module the students are able to apply the acquired skills in applications of the design, integration, development of electric power systems and to assess the results.   |
| <b>Personal Competence</b>                    |  |
| <i>Social Competence</i>                      | The students can participate in specialized and interdisciplinary discussions, advance ideas and represent their own work results in front of others.  |
| <i>Autonomy</i>                               | Students can independently tap knowledge of the emphasis of the lectures.  |
| <b>Workload in Hours</b>                      | Independent Study Time 110, Study Time in Lecture 70   |
| <b>Credit points</b>                          | 6  |
| <b>Course achievement</b>                     | None   |
| <b>Examination</b>                            | Written exam   |
| <b>Examination duration and scale</b>         | 90 - 150 minutes   |
| <b>Assignment for the Following Curricula</b> | General Engineering Science (German program, 7 semester): Specialisation Electrical Engineering: Elective Compulsory<br>Data Science: Core qualification: Elective Compulsory<br>Electrical Engineering: Core qualification: Elective Compulsory<br>Energy and Environmental Engineering: Specialisation Energy Engineering: Elective Compulsory<br>Energy Systems: Specialisation Energy Systems: Elective Compulsory<br>General Engineering Science (English program, 7 semester): Specialisation Electrical Engineering: Elective Compulsory<br>Computational Science and Engineering: Specialisation II. ## Module M0708: Electrical Engineering III: Circuit Theory and Transients

| <b>Courses</b>                        |   |               |           |
|---------------------------------------|---|---------------|-----------|
| <b>Title</b>                          | <b>Typ</b>  | <b>Hrs/wk</b> | <b>CP</b> |
| Circuit Theory (L0566)                | Lecture   | 3             | 4         |
| Circuit Theory (L0567)                | Recitation (small)  | Section 2     | 2         |
| <b>Module Responsible</b>             | Prof. Arne Jacob  |               |           |
| <b>Admission Requirements</b>         | None  |               |           |
| <b>Recommended Previous Knowledge</b> | Electrical Engineering I and II, Mathematics I and II   |               |           |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |               |           |
| <b>Professional Competence</b>        | <p><i>Knowledge</i></p> <p>Students are able to explain the basic methods for calculating electrical circuits. They know the Fourier series analysis of linear networks driven by periodic signals. They know the methods for transient analysis of linear networks in time and in frequency domain, and they are able to explain the frequency behaviour and the synthesis of passive two-terminal-circuits.</p> <p><i>Skills</i></p> <p>The students are able to calculate currents and voltages in linear networks by means of basic methods, also when driven by periodic signals. They are able to calculate transients in electrical circuits in time and frequency domain and are able to explain the respective transient behaviour. They are able to analyse and to synthesize the frequency behaviour of passive two-terminal-circuits.</p> |               |           |
| <b>Personal Competence</b>            | <p><i>Social Competence</i></p> <p>Students work on exercise tasks in small guided groups. They are encouraged to present and discuss their results within the group.</p> <p><i>Autonomy</i></p> <p>The students are able to find out the required methods for solving the given practice problems. Possibilities are given to test their knowledge during the lectures continuously by means of short-time tests. This allows them to control independently their educational objectives. They can link their gained knowledge to other courses like Electrical Engineering I and Mathematics I.</p>   |               |           |
| <b>Workload in Hours</b>              | Independent Study Time 110, Study Time in Lecture 70  |               |           |

## Module M0941: Combinatorial Structures and Algorithms

### Courses

| Title   | Typ  | Hrs/wk    | CP |
|---|--|-----------|----|
| Combinatorial Structures and Algorithms (L1100) | Lecture  | 3         | 4  |
| Combinatorial Structures and Algorithms (L1101) | Recitation (small)   | Section 1 | 2  |
| <b>Module Responsible</b>                       | Prof. Anusch Taraz   |           |    |
| <b>Admission Requirements</b>                   | None   |           |    |
| <b>Recommended Previous Knowledge</b>           | <ul style="list-style-type: none"> <li>• Mathematics I + II</li> <li>• Discrete Algebraic Structures</li> <li>• Graph Theory and Optimization</li> </ul>   |           |    |
| <b>Educational Objectives</b>                   | After taking part successfully, students have reached the following learning results   |           |    |
| <b>Professional Competence</b>                  | <ul style="list-style-type: none"> <li>• Students can name the basic concepts in Combinatorics and Algorithms. They are able to explain them using appropriate examples.</li> <li>• Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.</li> <li>• They know proof strategies and can reproduce them.</li> </ul>  |           |    |
| <i>Knowledge</i>                                |  |           |    |
| <i>Skills</i>                                   | <ul style="list-style-type: none"> <li>• Students can model problems in Combinatorics and Algorithms with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.</li> <li>• Students are able to discover and verify further logical connections between the concepts studied in the course.</li> <li>• For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.</li> </ul> |           |    |
| <b>Personal Competence</b>                      | <ul style="list-style-type: none"> <li>• Students are able to work together in teams. They are capable to use mathematics as a common language.</li> <li>• In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.</li> </ul>  |           |    |
| <i>Social Competence</i>                        |  |           |    |
| <i>Autonomy</i>                                 | <ul style="list-style-type: none"> <li>• Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</li> <li>• Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.</li> </ul>   |           |    |
| <b>Workload in Hours</b>                        | Independent Study Time 124, Study Time in Lecture 56   |           |    |

## Module M0634: Introduction into Medical Technology and Systems

### Courses

| Title  | Typ                | Hrs/wk    | CP |
|--|--------------------|-----------|----|
| Introduction into Medical Technology and Systems (L0342) | Lecture            | 2         | 3  |
| Introduction into Medical Technology and Systems (L0343) | Project Seminar    | 2         | 2  |
| Introduction into Medical Technology and Systems (L1876) | Recitation (large) | Section 1 | 1  |

|                           |                           |
|---------------------------|---------------------------|
| <b>Module Responsible</b> | Prof. Alexander Schlaefer |
|---------------------------|---------------------------|

|                               |      |
|-------------------------------|------|
| <b>Admission Requirements</b> | None |
|-------------------------------|------|

|                                       |   |
|---------------------------------------|---|
| <b>Recommended Previous Knowledge</b> | principles of math (algebra, analysis/calculus)<br>principles of stochastics<br>principles of programming, R/Matlab |
|---------------------------------------|---|

|                               |  |
|-------------------------------|--|
| <b>Educational Objectives</b> | After taking part successfully, students have reached the following learning results |
|-------------------------------|--|

|                                |   |
|--------------------------------|---|
| <b>Professional Competence</b> |   |
| <i>Knowledge</i>               | The students can explain principles of medical technology, including imaging systems, computer aided surgery, and medical information systems. They are able to give an overview of regulatory affairs and standards in medical technology. |
| <i>Skills</i>                  | The students are able to evaluate systems and medical devices in the context of clinical applications.  |
| <b>Personal Competence</b>     |   |
| <i>Social Competence</i>       | The students describe a problem in medical technology as a project, and define tasks that are solved in a joint effort.   |
| <i>Autonomy</i>                | The students can reflect their knowledge and document the results of their work. They can present the results in an appropriate manner.   |

|                          |  |
|--------------------------|--|
| <b>Workload in Hours</b> | Independent Study Time 110, Study Time in Lecture 70 |
|--------------------------|--|

|                      |   |
|----------------------|---|
| <b>Credit points</b> | 6 |
|----------------------|---|

| Course achievement | Compulsory | Bonus | Form         | Description         |

## Module M1269: Lab Cyber-Physical Systems

### Courses

| Title                                 | Typ   | Hrs/wk | CP |
|---------------------------------------|---|--------|----|
| Lab Cyber-Physical Systems (L1740)    | Project-/problem-based Learning   | 4      | 6  |
| <b>Module Responsible</b>             | Prof. Heiko Falk  |        |    |
| <b>Admission Requirements</b>         | None  |        |    |
| <b>Recommended Previous Knowledge</b> | Module "Embedded Systems"   |        |    |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |        |    |
| <b>Professional Competence</b>        | <p>Cyber-Physical Systems (CPS) are tightly integrated with their surrounding environment, via sensors, A/D and D/A converters, and actors. Due to their particular application areas, highly specialized sensors, processors and actors are common. Accordingly, there is a large variety of different specification approaches for CPS - in contrast to classical software engineering approaches.</p> <p>Based on practical experiments using robot kits and computers, the basics of specification and modelling of CPS are taught. The lab introduces into the area (basic notions, characteristical properties) and their specification techniques (models of computation, hierarchical automata, data flow models, petri nets, imperative approaches). Since CPS frequently perform control tasks, the lab's experiments will base on simple control applications. The experiments will use state-of-the-art industrial specification tools (MATLAB/Simulink, LabVIEW, NXC) in order to model cyber-physical models that interact with the environment via sensors and actors.</p> |        |    |
| <i>Knowledge</i>                      |   |        |    |
| <i>Skills</i>                         | <p>After successful attendance of the lab, students are able to develop simple CPS. They understand the interdependencies between a CPS and its surrounding processes which stem from the fact that a CPS interacts with the environment via sensors, A/D converters, digital processors, D/A converters and actors. The lab enables students to compare modelling approaches, to evaluate their advantages and limitations, and to decide which technique to use for a concrete task. They will be able to apply these techniques to practical problems. They obtain first experiences in hardware-related software development, in industry-relevant specification tools and in the area of simple control applications.</p>  |        |    |
| <b>Personal Competence</b>            |   |        |    |
| <i>Social Competence</i>              | <p>Students are able to solve similar problems alone or in a group and to present the results accordingly.</p>  |        |    |
| <i>Autonomy</i>                       | <p>Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes.</p>  |        |    |
| <b>Workload in Hours</b>              | Independent Study Time 124, Study Time in Lecture 56  |        |    |
| <b>Credit points</b>                  | 6   |        |    |
| <b>Course achievement</b>             | None  |        |    |
| <b>Examination</b>                    | Written elaboration   |        |    |
| <b>Examination</b>                    |   |        |    |

| <b>Module Responsible</b>             | Prof. Anusch Taraz   |
| <b>Admission Requirements</b>         | None   |
| <b>Recommended Previous Knowledge</b> | Mathematics 1 - III  |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results   |
| <b>Professional Competence</b>        |  |
| <i>Knowledge</i>                      | <ul style="list-style-type: none"> <li>• Students can name the basic concepts in Mathematics IV. They are able to explain them using appropriate examples.</li> <li>• Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.</li> <li>• They know proof strategies and can reproduce them.</li> </ul>  |
| <i>Skills</i>                         | <ul style="list-style-type: none"> <li>• Students can model problems in Mathematics IV with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.</li> <li>• Students are able to discover and verify further logical connections between the concepts studied in the course.</li> <li>• For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.</li> </ul> |
| <b>Personal Competence</b>            |  |
| <i>Social Competence</i>              | <ul style="list-style-type: none"> <li>• Students are able to work together in teams. They are capable to use mathematics as a common language.</li> <li>• In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.</li> </ul>  |
| <i>Autonomy</i>                       | <ul style="list-style-type: none"> <li>• Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.</li> <li>• Students have developed sufficient persistence to be able to work for longer</li> </ul>   |

## Module M0567: Theoretical Electrical Engineering I: Time-Independent Fields

### Courses

| Title   | Typ                | Hrs/wk               | CP |
|---|--------------------|----------------------|----|
| Theoretical Electrical Engineering I: Time-Independent Fields (L0180) | Lecture            | 3                    | 5  |
| Theoretical Electrical Engineering I: Time-Independent Fields (L0181) | Recitation (small) | Section <sub>2</sub> | 1  |

|                                       |   |
|---------------------------------------|---|
| <b>Module Responsible</b>             | Prof. Christian Schuster  |
| <b>Admission Requirements</b>         | None  |
| <b>Recommended Previous Knowledge</b> | Basic principles of electrical engineering and advanced mathematics   |
| <b>Educational Objectives</b>         | After taking part successfully, students have reached the following learning results  |
| <b>Professional Competence</b>        |   |
| <i>Knowledge</i>                      | Students can explain the fundamental formulas, relations, and methods of the theory of time-independent electromagnetic fields. They can explicate the principal behavior of electrostatic, magnetostatic, and current density fields with regard to respective sources. They can describe the properties of complex electromagnetic fields by means of superposition of solutions for simple fields. The students are aware of applications for the theory of time-independent electromagnetic fields and are able to explicate these.   |
| <i>Skills</i>                         | Students can apply Maxwell's Equations in integral notation in order to solve highly symmetrical, time-independent, electromagnetic field problems. Furthermore, they are capable of applying a variety of methods that require solving Maxwell's Equations for more general problems. The students can assess the principal effects of given time-independent sources of fields and analyze these quantitatively. They can deduce meaningful quantities for the characterization of electrostatic, magnetostatic, and electrical flow fields (capacitances, inductances, resistances, etc.) from given fields and dimension them for practical applications. |
| <b>Personal Competence</b>            |   |
| <i>Social Competence</i>              | Students are able to work together on subject related tasks in small groups. They are able to present their results effectively (e.g. during exercise sessions).  |
| <i>Autonomy</i>                       | Students are capable to gather necessary information from provided references and relate this information to the lecture. They are able to continually reflect their knowledge by means of activities that accompany the lecture, such as short oral quizzes during the lectures and exercises that are related to the exam. Based on respective feedback, students are expected to adjust their individual learning process. They are able to draw connections between their knowledge obtained in this lecture and the content of other lectures (e.g. Electrical Engineering I, Linear Algebra, and Analysis).   |
