Content

Core Qualification

Module M0523: Busin	ess & Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Skills	 Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.
Personal Competence	
Social Competence	Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

Course L1486: Business Mod	el Generation & Green Technologies
Тур	Seminar
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Examination Form	Referat
Examination duration and	0
scale	
Lecturer	Prof. Michael Prange
Language	EN
Cycle	WiSe
Content	 Overview about Green Technologies Introduction to Business Model Generation Business model patterns Design techniques for business ideas Strategy development Value proposition architecture Business plan and financing Component-based foundations Lean Entrepreneurship
	Based on examples and case studies primarily in the field of green technologies, students learn the basics of Business Model Generation and will be able to develop business models and to evaluate start-up projects.
Literature	Präsentationsfolien, Beispiele und Fallstudien aus der Vorlesung Presentation slides, examples and case studies from the lecture

Course L1487: Corporate Entrepreneurship & Green Innovation		
Тур	Seminar	
Hrs/wk	2	
СР	2	
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28

Content	Important note: This course is part of an 6 ECTS module consisting of two courses "Entrepreneurship" & "Creation of Business Opportunities", which have to be taken together in one semester.
	opportunities, which have to be taken together in one semester.
	Startups are temporary, team-based organizations, which can form both within and outside of established companies, to pursue
	one central objective: taking a new venture idea to market by designing a business model that can be scaled to a full-grown
	company. In this course, students will form startup teams around self-selected ideas and run through the process just like real
	startups would do in the first three months of intensive work. Startup Engineering takes an incremental and iterative approach,
	in that it favors variety and alternatives over one detailed, linear five-year business plan to reach steady state operations. From a
	problem solving and systems thinking perspective, student teams create different possible versions of a new venture and
	alternative hypotheses about value creation for customers and value capture vis-à-vis competitors. We will draw on recent
	scientific findings about international success factors of new venture design. To test critical hypotheses early on, student teams engage in scientific, evidence-based, experimental trial-and-error learning process that measures real progress.
	Upon completion of this course, students will be able to:
	· Apply a modern innovation toolkit relevant in both the corporate & startup world
	· Analyze given business opportunities in terms of its constituent elements
	Design new business models by gathering and combining relevant ideas, facts and information
	· Evaluate business opportunities and derive judgment about next steps & decisions
	Course language is English, but participants can decide to give their graded presentations in German. Students are invited to
	apply to this course module already with a startup idea and/ or team, but this is not a requirement! We will form teams and ideas
	in the beginning of the course. Class meetings have alternate intervals of lecture inputs, teamwork, mentoring, and
	peer feedback. Attendance is mandatory for at least 80% of class time due to large proportion of teamwork sessions.
	Student teams give three presentations and submit them with backup analyses. Grading scheme:
	Startup discovery presentation after 5 weeks: 30%
	Startup validation presentation after 10 weeks: 30%
	· Final startup pitches after 13 weeks: 40%

Content	Scientific knowledge grows continuously but also experiences certain alignments over time. For example, early cultures had the
	believe of a flat earth while latest research has a spherical earth model. Also in social science and business management, from
	time to time certain concepts that have even been the predominant paradigm are challenged by new observations and models.
	Consequently, certain controversies emerge and build the base for advancing theory and managerial practice. With this lecture,
	we put ourselves in the middle of heated debates for informed academics and practitioners of the day after tomorrow.
	The lecture targets several controversies in the domain of technology strategy and innovation management. By the classical
	academic method and the novel problem based learning format of a structured discussion, a given controversy is scrutinized. On
	selected topics, students will discuss a dispute and gain a thorough understanding. Specifically, based on a brief introduction of a
	motion, a affirmative constructive as well as a negative constructive is presented by two different student groups. Each
	presentation is followed by a response of the other group and questions from the class. Topics range from latest theories and
	concepts for value capture, to the importance of operating within a global marketplace, to cutting edge approaches for innovation
	stimulation and technology management. Consequently, this lecture deepens the knowledge in technology strategy and
	innovation management (TIM), enables a critical thinking and thought leadership.

Content	Contents
	Basics of Marketing
	The philosophy and fundamental aims of marketing. Contrasting different marketing fields (e.g. business-to-consumer versu business-to-business marketing). The process of marketing planning, implementation and controlling
	Strategic Marketing Planning
	How to find profit opportunities? How to develop cooperation, internationalization, timing, differentiation and cost leadership strategies?
	Market-oriented Design of products and services

How can companies get valuable customer input on product design and development? What is a service? How can companies design innovative services supporting the products?

Pricing

What are the underlying determinants of pricing decision? Which pricing strategies should companies choose over the life cycle of products? What are special forms of pricing on business-to-business markets (e.g. competitive bidding, auctions)?

Marketing Communication

What is the role of communication and advertising in business-to-business markets? Why advertise? How can companies manage communication over advertisement, exhibitions and public relations?

Sales and Distribution

How to build customer relationship? What are the major requirements of industrial selling? What is a distribution channel? How to design and manage a channel strategy on business-to-business markets?

Knowledge

Students will gain an introduction and good overview of

- Specific challenges in the marketing of innovative goods and services
- Key strategic areas in strategic marketing planning (cooperation, internationalization, timing)
- Tools for information gathering about future customer needs and requirements
- Fundamental pricing theories and pricing methods
- Main communication instruments
- Marketing channels and main organizational issues in sales management
- Basic approaches for managing customer relationship

Skills

Based on the acquired knowledge students will be able to:

- Design market timing decisions
- Make decisions for marketing-related cooperation and internationalization activities
- Manage the challenges of market-oriented development of new products and services
- Translate customer needs into concepts, prototypes and marketable offers
- Determine the perceived quality of an existing product or service using advanced elicitation and measurement techniques that fit the given situation
- Analyze the pricing alternatives for products and services
- Make strategic sales decisions for products and services (i.e. selection of sales channels)
- Analyze the value of customers and apply customer relationship management tools

Social Competence

The students will be able to

- have fruitful discussions and exchange arguments
- present results in a clear and concise way
- carry out respectful team work

Self-reliance

The students will be able to

- Acquire knowledge independently in the specific context and to map this knowledge on other new complex problem fields.
- Consider proposed business actions in the field of marketing and reflect on them.

Content	The lecture "project management" aims at characterizing typical phases of projects. Important contents are: possible tasks, organization, techniques and tools for initiation, definition, planning, management and finalization of projects. This will also be deepened by exercises within the framework of the event.
	The following topics will be covered in the lecture:
	 SMART, Work Breakdown Structure, Operationalization, Goals relation matrix Metra-Potential Method (MPM), Critical-Path Method (CPM), Program evaluation and review technique (PERT) Milestone Analysis, Earned Value Analyis (EVA) Progress reporting, Tracing of project goals, deadlines and costs, Project Management Control Loop, Maturity Level Assurance (MLA) Risk Management, Failure Mode and Effects Analysis (FMEA), Risk Matrix

Cycle	SoSe
Content	The Seminar teaches the basics of project management, which constitutes the foundations for technical as well as for business projects. It also includes a sideline about process management. The participants will work on the following questions:
	What is a project and what challenges does it imply?
	What methods have been developed to meet those challenges? What methods have been developed to meet those challenges?
	 How have this methods evolved over time? What is "state of the art" today? What basic skills should project members have?
	What is the difference between project and process? How can the latter be analyzed?
	That is the unterence between project and process. Now can the latter be untryzed.
	The approaches are not just taught theoretically, but put to use in group work. Through this approach, participants are enabled to
	work successfully on actual projects - and manage projects later on. As project work is increasingly important in work life, project
	management is a key skill for job applicants.
	Main topics of the seminar include:
	The "magic triangle" of project objectives
	Typical project phases
	Key instruments and methods (project structure plan, RACI, Gantt chart)
	Project organization and steering The appropriate to the particular to the par
	Team communication and collaboration The arith communication of Communication
	The agile approach of Scrum Process levels and cascading
	Process inversion and cascading Process improvement
	With the knowledge and experience from the seminar, participants should be able to acquire a basic certificate in project management with relatively little additional effort. The certification is available through institutions like GPM.
	Participants already start working on their homework paper in the group work. It comprises 5 to 10 pages and a structure plan for the chosen project, which can be done in Excel for example. Ideally, the members of the work groups write their homework paper together. The expected scale of the paper would increase in this case, yet not proportionally with the number of group members (4 participants would be expected to hand in a paper of 15-20 pages).

	Risks are inherent in every aspect of business, and the ability of managing risks is one important aspect that differentiates successful business leaders from others. There exist various categories of risk, such as credit, country, market, liquidity, operational, supply chain and reputational. Companies are vulnerable to risks. What makes such risks even more complex and challenging to manage is that the risks are often not within the direct control of the business executive. They can exist outside of the company boundary, and yet the impact to the company can be huge. The awareness and knowledge of how to manage risks in companies, will become increasingly important. Some of the main topics covered in this lecture include: Targets and legal aspects of risk management Risks and their impact Risk types (classification) Risk management and human resource Steps of the risk management process and their instruments Methods of risk assessment Implementation of risk management Management of specific risks This lecture is presented in German language only.

Content	The Management Consulting lecture teaches students knowledge that is complementary to their technical and business
	administration studies. They learn the basics of consulting and agent-principal theory and are given an overview of the consulting market. They are also shown how management consulting works and which methodical building blocks (processes) are needed to deal with a client's concerns and to undertake a consulting process. By means of practical examples students gain an insight into the extensive range of management consultancy services and of functional consulting.

Module M0524: Non-technical Courses for Master Dagmar Richter **Module Responsible Admission Requirements** None **Recommended Previous** Knowledge

Professional Competence

Knowledge The Nontechnical Academic Programms (NTA)

Educational Objectives After taking part successfully, students have reached the following learning results

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- · explain specialized areas in context of the relevant non-technical disciplines,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area.
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- · apply basic and specific methods of the said scientific disciplines,
- · aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist
- · to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

Personal Competence	
Social Competence	Personal Competences (Social Skills)
	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the countr (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	 to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)

Course L1775: "What's up, Doc?" Science and Stereotypes in Literature and Film	
Тур	Seminar
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Examination Form	Referat
Examination duration and	etwa 20 Minuten Präsentation und 10-20 Minuten Diskussion
scale	
Lecturer	Dr. Jennifer Henke
Language	EN
Cycle	WiSe/SoSe
Content	
	Popular novels and films significantly contribute to the public understanding of science and its representatives. How to define
	"good" or "bad" science is negotiated in a variety of artistic works. Stereotypes such as the "mad scientist", which originated in
	early nineteenth century England, continue to persist. Mary Shelley created the prototype of the obsessive and reckless scientist in
	Frankenstein - The Modern Prometheus (1818) who conducts his forbidden experiments in a secret lab and crosses ethical
	boundaries. This masculine stereotype has been followed by further ones such as the noble, adventurous or clumsy scientist,
	whereas scholars have only recently begun to consider the representation of female science.
	First, this seminar is devoted to selected formations of knowledge in relation to literature from classical antiquity to the present.
	Second, the focus shall rest on the production of persistent stereotypes in various media formats such as novels or films while
	paying particular attention to the aspect of gender. The overall goal of the seminar is an understanding of science as a cultural
	practice.
	Requirements for participation: Shelley, Mary: Frankenstein. New York: Norton, 2012. Please pay attention to the exact publication
	dates.
Literature	Teilnahmevoraussetzungen: Shelley, Mary: Frankenstein. New York: Norton, 2012. Bitte ausschließlich diese Edition anschaffen.

Course L2064: 120 years of film history	
Тур	Lecture
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Examination Form	Klausur
Examination duration and	90 min
scale	
Lecturer	Prof. Margarete Jarchow
Language	DE
Cycle	SoSe
Content	The lecture deals with the relationship between the development of film technology, film aesthetics, and society. Based on the
	nineteenth-century film's precursors such as the laterna magica, photography and kinetoscope, crucial stages of more than 120
	years of film history are studied chronologically in terms of: How does the development of new media techniques reflect certain
	social changes and needs? What new forms of aesthetic expression are possible through such technical innovations as the
	introduction of sound film, color film or handheld camera? And to what extent do these new forms of aesthetic expression in turn
	reflect certain social sensitivities, ultimately the respective zeitgeist? Main topics of the lecture are: the technical euphoria of the
	19th century, the early film, the German Expressionist film, the classic Hollywood cinema, the European postwar cinema,
	exploitation and underground cinema, New Hollywood, the blockbuster cinema, independent cinema up to current phenomena like
	the "cinema of dissolution". On the one hand, the participants learn in-depth, detailed knowledge of the history, meaning and
	analysis of the medium film and thereby acquire media literacy. On the other hand, the participants should gain a deeper
	understanding of the real interdependencies of technologies in culture and society and their historical transformation processes
	through an interdisciplinary perspective on film (history of technology, media studies and social science).

Content	Images are negotiating concepts of the own, other and alien. Especially tv series like "Game of Thrones", "Vikings", or "The Walking Dead" and films like "Alien" or "Lord of the Rings" show clashes of cultures. Irrespective of their genre - fantasy, science fiction, or history - the moving images use always similar patterns to show and tell the own and the other. During the seminar we will deal with such concepts and concepts of culture and the specifics of film and series to watch and analyse selected examples from these perspectives.
Literature	Literaturhinweise, Texte etc. werden zu gegebener Zeit online zur Verfügung gestellt.

	Dr. Marlis Bussacker
Language	DE
Cycle	WiSe/SoSe
	According to the FAZ in December 2015, the end of the world is booming. At all times, people have dealt with the imminent future scenario of ultimate horror - the collapse of their own world. Where does the idea of a final disaster come from? What's so fascinating about our own demise? During the seminar we will take a look at European cultural history, which is closely linked to mythological and religious prophecies about the end of the world. However, this question, or rather the question of survival in a post-apocalyptic world, has fortunately remained speculative to this day despite regular predictions. Since the end of the world has not yet happened in reality, we are therefore dependent on the imagination of writers, screenwriters and directors who have anticipated the event in an infinite number of texts, films and series. Based on selected films and texts, the seminar will focus on the questions of which apocalyptic scenarios are developed, with which problems the survivors are confronted and how they deal with the situation and with each other. The focus is on the reactions of people in a state of extreme threat. Which survival strategies are presented to us, how do we assess the behaviour of the actors, can we create alternatives? Furthermore, the effect of the genre on the recipient will be discussed. Do we dismiss films like Armaggedon and The Day After Tomorrow as entertaining thrills? Do we just enjoy the special effects? Do we feel threatened? Do we take them in the end as real instructions for action? Do they make us reflect? Or are even current social discourses reflected in the garment of the apocalypse?

Content	
	The course gives an introduction to the development of digitization in a media cultural perspective. In addition to technical
	aspects, we will focus on the cultural impact of digitization for current media users and the ermergence und development of media
	subcultures from the late 1970s to the 21st century. On the one hand, we will deal with questions such as: What is digitization?
	What is culture? What are digital (sub)cultures? In this context, the concept of ,digital natives' and ,digital immigrants', coined by
	Marc Prensky, will also be discussed. On the other hand, there will be a historical perspective on topics and developments such as the mediatization of the children's room in the early 1980s, the hacker scene, video game culture, the demo scene, digital culture
	in cinema, 8-bit culture, digital aesthetics, net art, post-digitality and ultimately the question of how digital subcultures have
	become part of the media mainstream at the beginning of the 21st century.
	pecome part of the media manistream at the beginning of the 21st century.

	Digitalization is having a major impact on many areas of our lives and the use of digital technologies in art and design has increased rapidly. After all, art is not only subject to constant change, but also constantly adapts to technical conditions. After the photographic art of the mid-19th century and the video art of the 1960s, which already brought about major changes in artistic creation, digital art is becoming increasingly important in the field of media art. The first attempts to use the computer with corresponding graphic software as an artistic medium took place in the 80/90s of the 20th century. Since then, there has been a broad development in the field of digital art, which now encompasses the most diverse digital pictorial phenomena and art genres and is thus intertwined in its objects, theories and practices with digital media in a variety of ways. The seminar gives an overview of the history of digital art and its different genres. These include, for example, photopaintings, where digital manipulation, filtering processes and painting can process the image and transform it over many stages into a completely new form. Also 3-D images, vector graphics, mathematical art and computer art in general. At the same time, the digital development in art is to be illuminated, from the first beginnings on the computer with comparatively simple "digital aids", e.g. in the form of simple image processing programs, to the present sophisticated graphic tools. In addition, the presentation, dissemination and conservation possibilities of digital art will also be discussed, which can be disseminated very well on the Internet primarily because it can be displayed on a computer screen. The great fascination with digital creative work and the almost inexhaustible possibilities offered by the medium of computers to artists, who will continue to ensure that digital art finds a permanent place alongside traditional media, will also be discussed. Finally, in contrast to the traditional production methods in the field

	Since the end of the 1980's or the beginning of the 1990's, in the Sociology of Technology a line of research has emerged which initially called for a socialization of the sociology of technology (especially through the Social Construction of Technology Approach [SCOT]) and right away called for its re-materialisation (especially through Bruno Latour and the Actor-Network Theory). Technologies, thus their basic idea, are always intertwined with society and shaped by their socio-cultural context. In reverse, society is also inherently formed by the existing technologies and an adequate sociology of technology has to deal especially with the interaction of both. In the seminar at hand first of all an overview shall be given about the classical sociology of technology which routinely used argumentations inspired by technological determinism, which shall be followed by the presentation of the SCOT-approach. The later in turn was criticised by the Actor-Network Theory (which will be presented in a separate section as well) as being social deterministic which has led to a rather heated debate about the agency of technological artefacts, which shall be presented and discussed in a further part of the seminar. In the last section of the class it shall be determined what kind of relevance the sociological analysis of technological artefacts and their societal embedding can or could implicate for the own lifeworld of the students - especially of course with special focus on their engineer studies.

Content	The seminar discusses concepts of 'the refugee' in the history of 'Western' political ideas over a period of about 2,750 years. We will try to understand these concepts as historically distinct. We will also analyze the powerful effect of related stereotypes and images. We will read and contextualize philosophical, sociological, juridical, literary and political texts. In the second part of the seminar we will use the patterns we found to understand actual discourses on flight and migration. One aim is also to recognize alternative representations in the articulations and practices of the refugees themselves.

In a challenging situation, what will help me to communicate respectfully and with appreciation? How can I express criticism or irritation honestly, directly and without reproach? Nonviolent Communication is a concept developed by Marshall B. Rosenberg, Ph.D., intended to help create an appreciative attitude towards oneself and others, and to live by it. Nonviolent Communication opens paths to express oneself in a mindful an responsible way, so that a bridge can be built even in challenging situations of conflict. Effective and satisfactory cooperation is only possible with well functioning communication between all parties involved, otherwise things will become difficult an inefficient. By working with their own examples and anticipating questions that might arise in their future professional lives, the students of Engineering Sciences will be able to reflect their own communication behavior and learn ways of cooperation and conjoint solution finding. This course will impart the essential competencies of communication necesary for that. Literature Etiterature Rosenberg, Marshall B. und Seits, Gabriele. (15. Lecturer	Prof. Christian Kautz, Jenny Alice Rohde
Language	DE
Cycle	WiSe/SoSe
Content	This course covers theory and practice of being a student teaching assistant in small-group instructional settings at TUHH. As part of the seminar, the participants have the opportunity to reflect on their work, e. g. through mutual observation and discussion.

For prior knowledge / the event requirements:

This event requires basic first work / collaboration experiences in the academic work structures of a higher education institution, which Master's students have acquired as part of the qualification for the Bachelor's degree at a university.

These presumed work experiences include specific self-study experiences at a college.

These are picked up, reflected, expanded and further developed both theoretically and practically with regard to learning from and in groups and later guiding this learning process.

Furthermore, experiences with different types of learning / group types of higher education, which are part of a degree program acquired during the bachelor's program, are assumed, taken up, reflected on, expanded and further developed here in the master's program.

The course also requires basic knowledge of presenting scholarly work results obtained by Master's students with a Bachelor's degree.

In the course, this experience with and in representation in a group situation will be expanded and further developed in the direction of students' involvement with their own role as well as their design in face-to-face interaction as well as in group processes, learning and leadership situations, as masters graduates Graduate unlike bachelor graduates professionally stronger in a moderating role and with the guidance of humans because with the guidance in subject matters are demanded.

According to the later professional role, the work of the seminar promotes and enables graduate students significantly more than graduates' qualifications for independent work and learning, transferring what they have learned to new areas, contributing, involving discussion and contributing their own examples and interests.

Lecturer	Prof. Margarete Jarchow, Anna Katharina Bartel
Language	EN
Cycle	WiSe/SoSe
Content	As young professionals with technical background you may often tend to focus on communicating numbers and statistics in your presentations. However, facts are only one aspect of convincing others. Often, your personality, personal experience, cultural background and emotions are more important. You have to convince as a person in order to get your content across. In this workshop you will learn how to increase and express your cultural competence. You will apply cultural knowledge and images in order to positively influence communicative situations. You will learn how to add character and interest to your talks, papers and publications by referring to your own and European Cultural background. You will find out the basics of communicating professionally and convincingly by showing personality and by referring to your own cultural knowledge. You will get hands-on experience both in preparing and in conducting such communicative situations. This course is not focussing on delivering new knowledge about European culture but helps you using existing knowledge or such that you can gain e.g. in other Humanities courses. Content
Literature	How to enrich the personal character of your presentations by referring to European and your own culture How to properly arrange content and structure. How to use PowerPoint for visualization (you will use computers in an NIT room). How to be well-prepared and convincing when delivering your thoughts to your audience. Literaturhinweise werden zu Beginn des Seminars bekanntgegeben. Literature will be announced at the beginning of the seminar.

Content	Digitalization, climate change, democracy - society is facing fundamental upheavals. The next generation of young engineers in particular must no longer remain out of debate and can provide answers to the big questions of our time. Why is social commitment important? Is studying preparing us well for the future? What needs to improve? In the interactive workshop, the participants will be accompanied in analyzing their own generation and their own actions and in developing thesis on how to improve technical studies and training. The result of the seminar will be a joint thesis paper.

Cycle	WiSe/SoSe		
Content	This course is for master students. In this seminar, we will explore different theories, models and methods from the fields of communication, psychology and cultural theory.		
	The participants will work on theoretical content and do group presentations. They will also use examples from their own experiences to apply models and methods in practical exercises.		
	The way we communicate shapes the way we experience our relationships, in the business world as well as in our private lives. We spend an overwhelming amount of time in group situations. This makes it worthwhile to explore how communication works within the group context and how, within these different groups, different cultures of communication develop. This particularly applies in highly specialized fields, such as engineering.		
	Our ability to flexibly and successfully move from one context to another helps us along in building successful careers and allows us to feel positive about our private lives.		
	However, this is not always simple. For example:		
	☐ If we are part of a context in which many conflicts arise		
	☐ If we have to switch between different contexts frequently		
	Or if, on the one hand, complicated facts and data are our main focus but on the other hand, we have to communicate them to people who are not familiar with the subject. Maybe we even have to win their attention in order to help along our causes.		
	Oftentimes, this leads to misunderstandings. There also might be a lack of openness or willingness to embrace conflict. This might make it difficult for us to reach our goals. To be able to reflect on the way we communicate, to identify patterns of communication and the ability to actively build positive relationships through communication are useful skills to help overcome those obstacles

Content	The seminar will provide an overview of Criminology and introduce different
	theories of criminality. It is necessary to consider the discipline of Criminology
	within its historical context in order to understand how some theories have
	evolved. The students will use this knowledge of Criminology theory to discuss
	and consider the advantages and disadvantages of each theory. Discussions
	will include how society constructs crime as well as a more philosophical
	debate about a determined view.
Literature	Wird zeitnah bekannt gegeben.

Content	The seminar LITERATURE AND CULTURE investigates what culture is, especially what characterises epistemic cultures.
	Culture is to be understood as the creative response to a given situation and the capacity to integrate inputs and influences,
	therefore as an ongoing process of permanent readjustment and learning, and by no means as a fixed identity in terms of an
	"essence".
	There is a growing awareness that Europe cannot lay claim to possess the ultimate standards of knowledge.
	A topography of our contemporary world is to be sketched by highlighting its historical and cultural premises.
	For more information please refer to the German description and the StudIP.
Literature	Je nach Thematik des Semesters wird eine spezifische
	Literatur-Liste erstellt.
	cf. StudIP

Content	The world wide walkover of the internet dramatically changed the perception of classical media like newspapers, magazines and even TV. In this seminar the reasons of and the consequences for the dramatic changes regarding our information habits will be analyzed and discussed. Has the media expert Neil Postman been right, when he one said, that we all one day will be "overnewsed but underinformed"? Keeping a close eye on the real challenges of journalism, the seminar will discuss the standards of ethics in politics and media.

Content Scientists and engineers neither just strive for truths and scientific laws, nor are they working in a space far from politics. Science and engineering have contributed to what we now call the Anthropocene, the first time in the history of mankind when essential cycles of the earth system, e.g. carbon cycle, climate system, are heavily influenced or even shattered. Furthermore, Peak oil is indicating the end of cheap fossil energy thus triggering the search for alternatives such as biomass.

Systems of knowledge, science and technology in the OECD countries have since roughly 30 years increasingly become divided. On the one hand new technologies such as modern biotechnology, IT or nanotechnology are developing rapidly, bringing about many innovations for industry, agriculture, and consumers. On the other hand scientific studies from earth, environmental, climate change, agricultural and social sciences deliver increasingly robust evidence on more or less severe impacts on society, environment, global equity, and economy resulting from innovations during the last 50 years. Technological innovation thus is no longer an uncontested concept. And many protest movements demonstrate that the introduction of new or the enlargement of existing technologies (e.g. airports, railway stations, highways, high-voltage power lines surveillance) isn't at all a matter of course.

It is important to bear in mind the fact that all processes of technological innovation are made by humans, individually and collectively. Industrial, social, and political organizations as actors from the local to global level of communication, deliberation, and decision making interact in diverse arenas, struggling to promote their respective corporate and/or political agenda. So innovations are as well a problem of technology as a problem of politics. Innovation and technology policies aren't the same in all countries. We can observe conceptual and practical variations.

Since the 1992 Earth Summit in Rio de Janeiro Agenda 21 constitutes a normative umbrella, indicating Sustainable Development (SD) as core cluster of earth politics on all levels from local to global. Meanwhile other documents such as the Millennium Development Goals (MDG) have complemented the SD agenda. SD can be interpreted as operationalization of the Universal Declaration of Human Rights, adopted in 1948 by the General Assembly of the United Nations and since amended many times.

Engineers and scientists as professionals can't avoid to become confronted with many non-technical and non-disciplinary items challenges, and dilemmas. So they have to choose between alternative options for action, as individuals and as members of organizations or employees. Therefore the seminar will address core elements of the complex interrelations between science. society and politics. Reflections on experiences of participants - e.g. from other countries as Germany - during the seminar are very welcome.

The goals of the seminar include:

- · Raising awareness and increasing knowledge about the political implications of scientific work and institutions;
- Improving the understanding of different concepts and designs of innovation and technology policies;
- Increasing knowledge about the status and perspectives of sustainable development as framework concept for technological and scientific progress:
- Understanding core elements of recent arguments, conflicts, and crises on technological innovations, e.g. geo-engineering
- Improving the understanding of scientists' responsibility for impacts of their professional activities:
- Embedding individual professional responsibility in social and political contexts.

The seminar will deal with current problems from areas such as innovation policy, energy, food systems, and raw materials. Issues will include the future of energy, food security and electronics. Historical issues will also be addressed.

The seminar will start with a profound overarching introduction. Issues will be introduced by a short presentation and a Q & A session, followed by group work on selected problems. All participants will have to prepare a presentation during the weekend seminar. The seminar will use inter alia interactive tools of teaching such as focus groups, simulations and presentations by students. Regular and active participation is required at all stages.

Literature Literatur wird zu Beginn des Seminars abgesprochen.

	Scientists often like to believe that their work is non-political. Within this seminar we want to demonstrate how deeply both are interconnected and converged. Not only, scientific guidance is often needed to take a political decision but also scientific outcomes are a sub-ject to political interpretation. Also, politics are significantly influencing scientific progress by framing research agendas and by funding decisions.
	During this seminar we would like to show the different range of influences - scientific, economic, social, environmental ethical/normative, security-related - affecting decision-making on science and politics. Using case studies on current debates or food security, public health, nuclear energy and terrorism to discuss the interrelation between science and politics illuminating the role of various actors in this process, such as:
	Governments, International organizations,
	• Scientific associations,
	• Industry,
	Civil society, and
	Individual scientists.
	The guiding questions will be:
	How does and should science influence politics?
	How does and should politics influence science?
	In order to take responsibility for the consequences of scientific work, engineers and scientists increasingly need to acknowledge the political dimension of their work and their role in the political process. We will address this political dimension of scientific work by discussing:
	Biographies and motivations of famous scientists,
	Individual responsibility of scientists for the implications of their work, and
	The role of codes of conduct as guidelines for responsible behaviour.
	The goals of the seminar include:
	Raising awareness and increasing knowledge about the political dimensions of scientific work,
	Providing guidelines for evaluating political implications of scientific research,
	• Improving the understanding of scientists' and engineers' responsibility for the results of their professional activities,
	• Taking decisions at the institutional, national and international level about rules and regulations concerning scientific conduct, and
	Choosing arguments and defending positions in situations of conflicting interests.
	The seminar will use current issues, such as dilemmas in the life sciences or bio fuels to demonstrate the problematic relationship between science and politics. The seminar, however, does not focus on providing in-depth knowledge of these current issues. We strongly discourage students that have participated in an "Ethics for Engineers" seminar to take this course, because the content of the two seminars overlap.
	Issues will be introduced by short presentations and a Q&A session, followed by group work on selected problems. All participant will have to prepare a presentation. Those requiring a graded certificate ("Schein") additionally have to write a 3-4 page paper o selected issues. The seminar will use interactive tools of teaching such as role playing and simulations. Group work and activ participation is expected at all stages of the seminar.

Content	The world wide walkover of the internet dramatically changed the perception of classical media like newspapers, magazines and even TV. In this seminar the reasons of and the consequences for the dramatic changes regarding our information habits will be analyzed and discussed: Taking a close look at the Middle East the political impact of the new media 's triumphal procession will be assessed and evaluated. How come that Twitter and Facebook on one hand facilitated the so called Arabic Spring and caused hope for the rise of democracy in the region, while on the other hand the revolutionaries failed so dramatically - at least for now. Keeping a close eye on both fields, the Media and the Middle East, the seminar will discuss the standards of ethics in politics and journalism.

Content	Over the centuries, the philosophy is lined up as a discipline that provides complex and universal answers to contemporary history and circumstances. Often, she could design utopias that have led the way for political upheaval. While all scientific disciplines are subject to an increasing differentiation, the philosophy in the second half of the 20th century has lost its claim to universality. But what then are the topics of the philosophy of the 20th and 21st century and what impact have philosophical theories for processes of change? We will provide an overview of Western philosophies of the 20th and 21st century. and take a critical look at the self-understanding of philosophy.

Cycle	WiSe/SoSe
Content	The course is aimed at Master students who are planning to write their thesis, want to pursue their PhD or intend to present their research results at conferences and in journals. The course is structured on three levels: 1. writing, 2. presenting and 3. interacting in organizational structures. The latter refers to the work environment at university as well as in research groups and enterprises. In the course of the seminar, the participants become acquainted with various methods and theories on the subject. Furthermore the methods and theories will be put into practice, reflected upon and discussed as part of the seminar.

Cycle	WiSe/SoSe
Content	Lying press - there is a revival of the disparaging invective. Journalists use to shoot it down by leading it back to its supposed roots in the NS-propaganda. This is less convincing as several parties and ideologies have used it since the middle of the 19 th century to discredit the media of other parties and ideologies. And it is missing the core of the problem. Critics are reasonably afraid that the choice of "lying press" to the "non-word of the year" 2014 has blocked the question, if there is a justified criticism of information media and journalism - or more precisely of the relationship between journalism and its audience. If this is the case both journalism and audience - are involved from the perspective of inter actionism.
	Against this background interactive instructions will be given by scholarly literature and practical examples from the German an international media business.
	Questions like the following will be discussed:
	 Is journalism really a profession? If so - since when? What is journalism for? (task and duties, functions, self-images) Do the audience and journalists themselves have a reasonable understanding of tasks, functions, practices, problems o journalism?
	 What is the current concept of journalistic professionalism? Has it ever been the same? From an international perspective: Does journalism in Germany have special shortcomings - if so, how can they b removed?
	 What are the economic challenges for journalism from the digital media upheaval? In which direction do journalistic professionalism and self-understanding change in the digital media world?
	Objective is solid learning about professional tasks, ethics, techniques, endagerments, history and current problems of journalism including science journalism.

	Algorithmic game theory is a topic at the intersection of economics and computation. It deals with analyzing the behavior and interactions of strategic agents, who often try to maximize their incentives. The environment in which those agents interact is referred to as a game. We wish to understand if the agents can reach an "equilibrium", or steady state of the game, in which agents have no incentive to deviate from their chosen strategies. The algorithmic part is to design efficient methods to find equilibria in games, and to make recommendations to the agents so that they can quickly reach a state of personal satisfaction. We will also study mechanism design. In mechanism design, we wish to design markets and auctions and give strategic options to agents, so that they have an incentive to act rationally. We also wish to design the markets and auctions so that they are efficient, in the sense that all goods are cleared and agents do not overpay for the goods which they acquire. Topics: • basic equilibrium concepts (Nash equilibria, correlated equilibria,) • strategic actions (best-response dynamics, no-regret dynamics,) • auction design (revenue-maximizing auctions, Vickrey auctions) • stable matching theory (preference aggregations, kidney exchanges,) • price of anarchy and selfish routing (Braess' paradox, congestion games,)

Content	Description
	The term dependability comprises various aspects of a system. These are typically:
	Reliability
	Availability
	Maintainability
	Safety
	Security
	This makes dependability a core aspect that has to be considered early in system design, no matter whether software, embedded
	systems or full scale cyber-physical systems are considered.
	Contents
	The module introduces the basic concepts for the design and the analysis of dependable systems. Design examples for getting
	practical hands-on-experience in dependable design techniques. The module focuses towards embedded systems. The following
	topics are covered:
	Modelling
	Fault Tolerance
	Design Concepts
	Analysis Techniques

Recommended Previous Knowledge	 Mathematics 1-3 	eering (e.g. from lecture "Fundamental	s of Communic	cations and Randor
Educational Objectives	After taking part successfully, students have reached	I the following learning results		
Professional Competence				
	The students know the basic definitions for quantification of information in the sense of information theory. They know Shannon's source coding theorem and channel coding theorem and are able to determine theoretical limits of data compression and error-free data transmission over noisy channels. They understand the principles of source coding as well as error-detecting and error-correcting channel coding. They are familiar with the principles of decoding, in particular with modern methods of iterative decoding. They know fundamental coding schemes, their properties and decoding algorithms. The students are able to determine the limits of data compression as well as of data transmission through noisy channels and based on those limits to design basic parameters of a transmission scheme. They can estimate the parameters of an error-detecting or error-correcting channel coding scheme for achieving certain performance targets. They are able to compare the properties of basic channel coding and decoding schemes regarding error correction capabilities, decoding delay, decoding complexity and to decide for a suitable method. They are capable of implementing basic coding and decoding schemes in software.			
Personal Competence				
Social Competence	The students can jointly solve specific problems.			
Autonomy	The students are able to acquire relevant inform knowledge during the lecture period by solving tutori			control their level o

	Introduction to Control Systems			
Knowledge	·			
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence				
Knowledge	Students can explain how linear dynamic	c systems are represented as state space n	nodels: they can	interpret the system
	response to initial states or external excit		ioucio, circy curi	medipied and bystein
	'	controllability and observability, and their re	ationship to stat	e feedback and state
	estimation, respectively			
	 They can explain the significance of a mir 	nimal realisation		
		edback and how it can be used to achieve tra	cking and disturl	bance rejection
	They can extend all of the above to multi-	• •		
	They can explain the z-transform and its r They can explain state space models and	relationship with the Laplace Transform transfer function models of discrete-time sys	stems	
		ication of ARX models of dynamic systems, a		tification problem can
	be solved by solving a normal equation			, , , , , , , , , , , , , , , , , , , ,
	They can explain how a state space mode	el can be constructed from a discrete-time im	pulse response	
Skills				
		models into state space models and vice vers	sa	
	They can assess controllability and observed.			
	They can design LQG controllers for multi They can carry out a controller design by	variable plants oth in continuous-time and discrete-time don	nain and decide	which is appropriate
	for a given sampling rate	ori in continuous-time and discrete-time don	iaiii, aiiu ueciue	willeii is арргорнате
		s and state space models of dynamic system	s from experimer	ntal data
	They can carry out all these tasks using	standard software tools (Matlab Control To	olbox, System Id	dentification Toolbox,
	Simulink)			
Personal Competence				
Social Competence	Students can work in small groups on specific pr	oblems to arrive at joint solutions.		
Autonomy	Students can obtain information from provided	sources (lecture notes, software desument	tation experime	at guidas) and usa it
Autonomy	Students can obtain information from provided when solving given problems.	Sources (lecture notes, software document	ation, experime	nt guides) and use it
	When solving given problems.			
	They can assess their knowledge in weekly on-li	ne tests and thereby control their learning pr	ogress.

Specialization IV. Subject Specific Focus

urses			
le	Тур	Hrs/wk	СР
Module Responsible	Prof. Volker Turau		
Admission Requirements	None		
Recommended Previous			•
Knowledge			
Educational Objectives	After taking part successfully, students have reached the following learning	results	
Professional Competence			
Knowledge			
Skills			
Personal Competence			
Social Competence			
Autonomy			
Workload in Hours	Depends on choice of courses		
Credit points	12	·	
Assignment for the	Computational Science and Engineering: Specialisation IV. Subject Specific	Focus: Elective Compulsory	
Following Curricula			

Modulo M1/25: Tochr	nical Complementary Course II for Computational Science and Engineering
Module MI433. Techi	incar complementary course in for computational science and Engineering
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Prof. Volker Turau
Admission Requirements	None
Recommended Previous

Thesis

Module M-002: Maste	er Thesis	
Courses		
Title	Typ Hrs/wk	СР
Module Responsible		
Admission Requirements		
	According to General Regulations §21 (1):	
	At least 60 credit points have to be achieved in study programme. The examinations board decides on ex	cceptions.
Recommended Previous		
Knowledge		
Professional Competence		
Knowledge	 The students can use specialized knowledge (facts, theories, and methods) of their subject compete 	ently on specialized
	issues.	, ,
	• The students can explain in depth the relevant approaches and terminologies in one or more area	as of their subject,
	describing current developments and taking up a critical position on them.	
	The students can place a research task in their subject area in its context and describe and critically	assess the state of
	research.	
Skills	Is The students are able:	
	To select, apply and, if necessary, develop further methods that are suitable for solving the specialized p	
	To apply knowledge they have acquired and methods they have learnt in the course of their studies	to complex and/or
	incompletely defined problems in a solution-oriented way.	
	To develop new scientific findings in their subject area and subject them to a critical assessment.	
Personal Competence	e	
Social Competence	e Students can	
	Both in writing and orally outline a scientific issue for an expert audience accurately, understandably	and in a structured
	way.	
	Deal with issues competently in an expert discussion and answer them in a manner that is appropriate while unhelding their own assessments and viewpoints convincingly.	e to the addressees
	while upholding their own assessments and viewpoints convincingly.	
Autonomy	Students are able.	
Autonomy	y Students are able:	
	To structure a project of their own in work packages and to work them off accordingly.	
	To work their way in depth into a largely unknown subject and to access the information required for their	m to do so.
	To apply the techniques of scientific work comprehensively in research of their own.	
Workload in Hours	Independent Study Time 000 Study Time in Lecture 0
