# **Program description**

#### Content

Among the industries with the greatest growth rates is the communications industry which, over the years, has achieved in its products the synergy of the classical disciplines of computer science and networking. The International Master Program Information and Communication Systems addresses this rapidly evolving area by laying in-depth foundations for the design and implementation of networking infrastructures, networked Cyber Physical Systems and the applications and services running on them.

The program is organized as a two-year course (four semesters) which starts on 1st of October each year. It includes around two semesters of lectures and practical courses and almost two semesters devoted to work in a research team (project work) and to the preparation of a master's thesis. The "Master of Science" degree will be awarded. Language of the program is English.

Graduates of the program are provided with the basics and knowledge that are required for a successful engineering activity in the information and communication technology in an international environment. They acquire extensive knowledge in the mathematical, engineering and scientific basic principles of this discipline based on a solid theoretical foundation including all the essential application-oriented aspects. Graduates are qualified to independently resolve problems in the information and communications technology and related disciplines.

The graduates are able to apply methods and procedures required to work on technical issues, as well as critically examine new insights to further develop and incorporate in their work. In this way, they are qualified to carry out their duties for society responsibly.

# **Career prospects**

The study of Information and Communication Systems provides the in-depth training in the areas of Information and Communication Technology, Software Systems, IT Security and Signal Processing. This enables excellent career prospects both in the industrial as well as on the academic job market. The Master's degree qualifies graduates for doctoral studies.

# Learning target

#### Knowledge

The students gain common knowledge from the core qualification and more specific knowledge depending on the selected specialisation. All students are able to describe information theory and coding basics.

Specialisation Communication Systems:

Students can

- show their profound knowledge in digital communications,
- describe their specialized knowledge in communication networks,
- explain software development principles,
- · explain signal processing fundamentals.

Specialisation Secure and Dependable IT Systems:

Students can

- give an overview of software verification,
- describe security principles for information and communication systems,
- explain their specialized knowledge in communication networks,
- describe software development and signal processing principles

# Skills

The ability to apply knowledge in order to perform tasks and solve problems will be supported in this course. Information and Communication Systems graduates are capable to

- solve problems in information and communication systems by applying and adapting techniques, procedures and methods that are required for a successful professional
  activity and by using engineering systematics,
- organize the planning of theoretical and experimental studies in order to develop optimal solutions for complex applications in information and communication technology and evaluate the solutions analyse problems using scientific systematics and solve them most effectively to develop economically viable approaches for products and systematically reflect non-technical implications of engineering activity to responsibly involve them in their actions,
- evaluate reliability of developed systems, prepare and review results of practical applications so that they can be used for systems optimization
- Investigate, evaluate and integrate new technologies, systems, architecture, services and applications for information and communication systems.

# Social skills

The ability of target-oriented work in collaboration with others, communication, and understanding their interests and social situations are goals of this course. The students can

- present and argue the results of their work in written and oral form in an comprehensible way,
- communicate and collaborate with international professionals, also of other disciplines,
- collaborate in challenging projects of information and communications technology in a responsible position,
- develop ideas and solutions in team work.

# Autonomy

The course helps to improve ability and readiness to act independently and responsibly, reflect own actions and the actions of others, and to develop the own functioning. Information and Communication Systems students are capable to

- identify knowledge gaps and propose solutions to overcome these gaps,
- · expand and deepen their knowledge and skills independently, taking into account ecological and economic demands responsibly,
- familiarize themselves with complex tasks, define new tasks and develop the necessary knowledge for solving it and to systematically apply appropriate means.

# Program structure

The four-semester program is designed modularly and is based on the university-wide standardized course structure with uniform module sizes (multiples of six credit points (CP)).

Core qualification: 48 CP

Specialization: 42 CP

Master thesis: 30 CP

Total: 120 CP

The core qualification consists of the module Information Theory and Coding (6 CP), technical complementary courses (12 CP), Business & Management (6 CP), nontechnical complementary courses (6 CP) and research project with seminar (18 CP). The research project with seminar consists of a scientific thesis with documentation and accompanying presentations in a seminar among fellow students.

The students choose between two specialisations (42 CP each):

• Communication Systems

Containing: Communications, software, and signal processing

• Secure and Dependable IT Systems

Containing: IT security, networks, software and signal processing

Students write a master thesis (30 CP).

# Core qualification

Module M0523: Business &	Management Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge Skills	<ul> <li>Students are able to find their way around selected special areas of management within the scope of business management.</li> <li>Students are able to explain basic theories, categories, and models in selected special areas of business management.</li> <li>Students are able to interrelate technical and management knowledge.</li> <li>Students are able to apply basic methods in selected areas of business management.</li> <li>Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.</li> </ul>
Personal Competence Social Competence Autonomy	Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

#### Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module M0524: Nontechnical Elective Complementary Courses for Master			
Module Responsible	Dagmar Richter		
Admission Requirements	None		
Recommended Previous	None		
Knowledge			
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge	The Nontechnical Academic Programms (NTA)		
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-		

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

#### The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

#### **Teaching and Learning Arrangements**

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

#### Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g., the skills required by outgoing engineers in international and intercultural situations.

# The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

# Specialized Competence (Knowledge)

# Students can

- explain specialized areas in context of the relevant non-technical disciplines,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

# Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic and specific methods of the said scientific disciplines,
- aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

# Personal Competence

Social Competence

# Personal Competences (Social Skills)

Students will be able

- to learn to collaborate in different manner.
- to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,

	<ul> <li>to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),</li> <li>to explain nontechnical items to auditorium with technical background knowledge.</li> </ul>
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas  to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly
	to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours Credit points	Depends on choice of courses 6

# **Specialization Communication Systems**

Graduates of the Communication Systems specialisation are qualified to independently resolve problems in communication networks and digital communications. They also have profound knowledge in software development principles and signal processing. Graduates are qualified to independently resolve problems in communication systems technology and related disciplines.

The Communication Systems specialisation is recommended for students who already bring along a good mathematical foundation, basic knowledge in computer science and/or electrical engineering with focus on information and communication technology.

Module M0837: Communic	ation Networks II - Simulation and Modeling			
Courses				
Title		Тур	Hrs/wk	СР
Simulation and Modelling of Communicatio	n Networks (L0887)	Problem-based Learning	5	6
Module Responsible	Prof. Andreas Timm-Giel			
Admission Requirements	None			
Recommended Previous Knowledge	Knowledge of computer and communication networ     Basic programming skills	ks		
Educational Objectives	After taking part successfully, students have reached the following	lowing learning results		
Professional Competence				
Knowledge	Students are able to explain the necessary stochastics, the discrete event simulation technology and modelling of networks for performance evaluation.			
Skills	Students are able to apply the method of simulation for performance evaluation to different, also not practiced, problems of communication networks. The students can analyse the obtained results and explain the effects observed in the network. They are able to question their own results.			
Personal Competence				
Social Competence	Students are able to acquire expert knowledge in groups, solutions for new problems in small teams.	present the results, and discuss solution app	roaches and results. Th	ey are able to work out
Autonomy	Students are able to transfer independently and in discussion with others the acquired method and expert knowledge to new problems. They can identify missing knowledge and acquire this knowledge independently.

Content	In the course necessary basic stochastics and the discrete event simulation are introduced. Also simulation models for communication networks, for	
	example, traffic models, mobility models and radio channel models are presented in the lecture. Students work with a simulation tool, where they can	
	directly try out the acquired skills, algorithms and models. At the end of the course increasingly complex networks and protocols are considered and thei	
	performance is determined by simulation.

Content	The lecture deals with technical principles and related concepts of mobile communications. In this context, the main focus is put on the physical and data link layer of the ISO-OSI stack.
	In the lecture, the transmission medium, i.e., the mobile radio channel, serves as the starting point of all considerations. The characteristics and the mathematical descriptions of the radio channel are discussed in detail. Subsequently, various physical layer aspects of wireless transmission are covered, such as channel coding, modulation/demodulation, channel estimation, synchronization, and equalization. Moreover, the different uses of multiple antennas at the transmitter and receiver, known as MIMO techniques, are described. Besides these physical layer topics, concepts of multiple access schemes in a cellular network are outlined.  In order to illustrate the above-mentioned technical solutions, the lecture will also provide a system view, highlighting the basics of some contemporary wireless systems, including UMTS/HSPA, LTE, LTE Advanced, and WiMAX.

Module M0550: Digital Imag	ge Analysis				
Courses					
Courses	Typ Hrs/wk CP				
Digital Image Analysis (L0126)	Typ         Hrs/wk         CP           Lecture         4         6				
Module Responsible	Prof. Rolf-Rainer Grigat				
Admission Requirements	1 101 Tullion Cingue				
Recommended Previous	System theory of one-dimensional signals (convolution and correlation, sampling theory, interpolation and decimation, Fourier transform, linear time-				
Knowledge	invariant systems), linear algebra (Eigenvalue decomposition, SVD), basic stochastics and statistics (expectation values, influence of sample size,				
· ·	correlation and covariance, normal distribution and its parameters), basics of Matlab, basics in optics				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	Students can				
	Describe imaging processes				
	<ul> <li>Depict the physics of sensorics</li> <li>Explain linear and non-linear filtering of signals</li> </ul>				
	Explain linear and non-linear illering of signals     Establish interdisciplinary connections in the subject area and arrange them in their context				
	Interpret effects of the most important classes of imaging sensors and displays using mathematical methods and physical models.				
	, , , , , , , , , , , , , , , , , , ,				
Skills	Students are able to				
	Lieu highly conhictionand methods and procedures of the cubicat area.				
	<ul> <li>Use highly sophisticated methods and procedures of the subject area</li> <li>Identify problems and develop and implement creative solutions.</li> </ul>				
	Identity problems and develop and implement creative solutions.				
	Students can solve simple arithmetical problems relating to the specification and design of image processing and image analysis systems.				
	Students are able to assess different solution approaches in multidimensional decision-making areas.				
	Students can undertake a prototypical analysis of processes in Matlab.				
Personal Competence					
Social Competence					
Autonomy	Students can solve image analysis tasks independently using the relevant literature.				
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56				
Credit points

Module M0677: Digital Sign	al Processing and Digital Filters			
Courses				
Title		Тур	Hrs/wk	СР
Digital Signal Processing and Digital Filters	s (L0446)	Lecture	3	4
Digital Signal Processing and Digital Filters	s (L0447)	Recitation Section (large)	1	2
Module Responsible	Prof. Gerhard Bauch			
Admission Requirements	None			
Recommended Previous	Mathematics 1-3			
Knowledge	Signals and Systems			
	Fundamentals of signal and system theory as well as randon	n processes.		
	Fundamentals of spectral transforms (Fourier series, Fourier)	•		
Educational Objectives	After taking part successfully, students have reached the following le	earning results		
Professional Competence				
Knowledge	The students know and understand basic algorithms of digital sign	al processing. They are familiar with	the spectral transform	s of discrete-time signals
	and are able to describe and analyse signals and systems in time	and image domain. They know basic	structures of digital fil	ters and can identify and
	assess important properties including stability. They are aware of t	* *		•
	with the basics of adaptive filters. They can perform traditional and p	parametric methods of spectrum estin	nation, also taking a lin	nited observation window
	into account.			
Skills	The students are able to apply methods of digital signal processin			
	particular, the can design adaptive filters according to the minimum mean squared error (MMSE) criterion and develop an efficient implementation,			
	e.g. based on the LMS or RLS algorithm. Furthermore, the students are able to apply methods of spectrum estimation and to take the effects of a limited observation window into account.			
Personal Competence	observation window into account.			
Social Competence	The students can jointly solve specific problems.			
Godiai competence	The state has early some specime problems.			
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture			
	period by solving tutorial problems, software tools, clicker system.			
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56

Module M0738: Digital Aud	io Signal Processing			
Courses				
Title		Тур	Hrs/wk	СР
Digital Audio Signal Processing (L0650)		Lecture	3	4
Digital Audio Signal Processing (L0651)		Recitation Section (large)	1	2
Module Responsible	Prof. Udo Zölzer			
Admission Requirements	None			
Recommended Previous				
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following	g learning results		
Professional Competence				
Knowledge	Die Studierenden können die grundlegenden Verfahren und M	ethoden der digitalen Audiosignalvera	arbeitung erklären. Sie	können die wesentlichen
	physikalischen Effekte bei der Sprach- und Audiosignalvera	rbeitung erläutern und in Kategorier	n einordnen. Sie könr	en einen Überblick der
	numerischen Methoden und messtechnischen Charakterisierur	ng von Algorithmen zur Audiosignalve	erarbeitung geben. Sie	können die erarbeiteten
	Algorithmen auf weitere Anwendungen im Bereich der Informatio	nstechnik und Informatik abstrahieren.		
Skills	The students will be able to apply methods and techniques from audio signal processing in the fields of mobile and internet communication. They can rely on elementary algorithms of audio signal processing in form of Matlab code and interactive JAVA applets. They can study parameter modifications and evaluate the influence on human perception and technical applications in a variety of applications beyond audio signal processing. Students can perform measurements in time and frequency domain in order to give objective and subjective quality measures with respect to the methods and applications.			
Personal Competence				
Social Competence	The students can work in small groups to study special tasks an	d problems and will be enforced to pro	esent their results with a	adequate methods during
	the exercise.			
Autonomy	The students will be able to retrieve information out of the relevant literature in the field and putt hem into the context of the lecture. They can relate their gathered knowledge and relate them to other lectures (signals and systems, digital communication systems, image and video processing, and pattern recognition). They will be prepared to understand and communicate problems and effects in the field audio signal processing.

Content	Computer graphics and animation are leading to an unprecedented visual revolution. The course deals with its technological foundations:
	Object-oriented Computer Graphics
	Projections and Transformations
	Polygonal and Parametric Modelling
	Illuminating, Shading, Rendering
	Computer Animation Techniques
	Kinematics and Dynamics Effects
	Students will be be working on a series of mini-projects which will eventually evolve into a final project. Learning computer graphics and animation
	resembles learning a musical instrument. Therefore, doing your projects well and in time is essential for performing well on this course.

## Specialization Secure and Dependable IT Systems

Graduates of the Secure and Dependable IT Systems specialisation acquire extensive knowledge in software verification and IT security. They also have knowledge in communication networks and signal processing. They are able to apply methods and procedures required to work on secure and dependable IT systems, as well as critically examine new insights to further develop and incorporate in their work.

The Secure and Dependable IT Systems specialisation is recommended for students who already have a good mathematical foundation and basic knowledge in computer science and software development.

Admission Requirements	None			
Recommended Previous Knowledge	Automata theory and formal languages     Computational logic     Object-oriented programming, algorithms, and data strue     Functional programming or procedural programming     Concurrency	ctures		
Educational Objectives	After taking part successfully, students have reached the following	ing learning results		
Professional Competence	<u> </u>	3 3		
Knowledge				
Skills	Students apply the major verification techniques in model checking and deductive verification. They explain in formal terms syntax and semantics of the underlying logics, and assess the expressivity of different logics as well as their limitations. They classify formal properties of software systems. They find flaws in formal arguments, arising from modeling artifacts or underspecification.  Students formulate provable properties of a software system in a formal language. They develop logic-based models that properly abstract from the software under verification and, where necessary, adapt model or property. They construct proofs and property checks by hand or using tools for model checking or deductive verification, and reflect on the scope of the results. Presented with a verification problem in natural language, they select the appropriate verification technique and justify their choice.			
Personal Competence				
Social Competence	Students discuss relevant topics in class. They defend their solu	utions orally. They communicate in English	1.	
Autonomy	Using accompanying on-line material for self study, students of exercise problems, they receive additional feedback. Within I identify and precisely formulate new problems in academic or independent studies to acquire the necessary competencies solutions or assess existing ones.	imits, they can set their own learning go r applied research in the field of software	als. Upon successful o	completion, students can s field, they can conduct

Content	Content:
	This course is about the foundations of cryptography. We introduce cryptographic security models and concepts and understand the relations between
	them. We then apply the learnt concepts and techniques to real-world problems. In particular, we cover:
	- One-way functions
	- Pseudorandomness
	- Pseudorandom generators
	- Pseudorandom functions
	- symmetric encryption
	- asymmetric encryption
	- message authentication codes
	- signature schemes

Knowledge	Mathematics 1-3     Signals and Customs			
	Signals and Systems     Fundamentals of Communications and Random Proces			
	Fundamentals of Communications and Random Proces	ses		
Educational Objectives	After taking part successfully, students have reached the follow	ing learning results		
Professional Competence				
Knowledge	The students are able to understand, compare and design m	odern digital information transmission sche	emes. They are famili	ar with the properties of
	linear and non-linear digital modulation methods. They can d	escribe distortions caused by transmission	channels and design	and evaluate detectors
	including channel estimation and equalization. They know the	e principles of single carrier transmission	and multi-carrier tran	smission as well as the
	fundamentals of basic multiple access schemes.			
Skills	The students are able to design and analyse a digital inform	ation transmission scheme including multip	ole access. They are	able to choose a digital
	modulation scheme taking into account transmission rate, re	quired bandwidth, error probability, and fu	urther signal propertion	es. They can design an
	appropriate detector including channel estimation and equalization taking into account performance and complexity properties of suboptimum solutions.			
	They are able to set parameters of a single carrier or multi carri	er transmission scheme and trade the prope	rties of both approach	nes against each other.
Personal Competence				
Social Competence	The students can jointly solve specific problems.			
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture			ledge during the lecture
	period by solving tutorial problems, software tools, clicker syste	m.

Workload in Hours	Independent Study Time 110, Study Time in Lecture 70		
Lecturer	Prof. Andreas Timm-Giel		
Language	EN		
Cycle	SoSe		
Content	In the course necessary basic stochastics and the discrete event simulation are introduced. Also simulation models for communication networks, for example, traffic models, mobility models and radio channel models are presented in the lecture. Students work with a simulation tool, where they can directly try out the acquired skills, algorithms and models. At the end of the course increasingly complex networks and protocols are considered and their performance is determined by simulation.		
Literature	Skript des Instituts für Kommunikationsnetze  Further literature is announced at the beginning of the lecture.

## Focus Software and Signal Processing

Module M0550: Digital Imag	na Analysis
Module Mosso. Digital illiag	je Arialysis
Courses	
Title	Typ Hrs/wk CP
Digital Image Analysis (L0126)	Lecture 4 6
Module Responsible	Prof. Rolf-Rainer Grigat
Admission Requirements	
Recommended Previous	System theory of one-dimensional signals (convolution and correlation, sampling theory, interpolation and decimation, Fourier transform, linear time-
Knowledge	invariant systems), linear algebra (Eigenvalue decomposition, SVD), basic stochastics and statistics (expectation values, influence of sample size,
	correlation and covariance, normal distribution and its parameters), basics of Matlab, basics in optics
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	Students can
	a Danilla innaire anno
	<ul> <li>Describe imaging processes</li> <li>Depict the physics of sensorics</li> </ul>
	Explain linear and non-linear filtering of signals
	Establish interdisciplinary connections in the subject area and arrange them in their context
	Interpret effects of the most important classes of imaging sensors and displays using mathematical methods and physical models.
Skills	Students are able to
	Use highly sophisticated methods and procedures of the subject area
	Identify problems and develop and implement creative solutions.
	notify problems and develop and imposition deductions.
	Students can solve simple arithmetical problems relating to the specification and design of image processing and image analysis systems.
	Students are able to assess different solution approaches in multidimensional decision-making areas.
	Students can undertake a prototypical analysis of processes in Matlab.
Personal Competence	
Social Competence	
coolai compotento	
Autonomy	Students can solve image analysis tasks independently using the relevant literature.

Educational Objectives After taking part successfully, students have reached the following learning results  Professional Competence  Knowledge  Die Studierenden k\u00f6nnen die grundlegenden Verfahren und Methoden der digitalen Audiosignalverarbeitung erkl\u00e4ren. Sie k\u00f6nnen die wesentlichen physikalischen Effekte bei der Sprach- und Audiosignalverarbeitung erf\u00e4utern und in Kategorien einordnen. Sie k\u00f6nnen einen \u00dcberheite der numerischen Methoden und messtechnischen Charakterisierung von Algorithmen zur Audiosignalverarbeitung geben. Sie k\u00f6nnen die erarbeiteten Algorithmen auf weitere Anwendungen im Bereich der Informationstechnik und Informatik abstrahieren.  Skills  The students will be able to apply methods and techniques from audio signal processing in the fields of mobile and internet communication. They can rely on elementary algorithms of audio signal processing in form of Matlab code and interactive JAVA applets. They can study parameter modifications and evaluate the influence on human perception and technical applications in a variety of applications beyond audio signal processing. Students can perform measurements in time and frequency domain in order to give objective and subjective quality measures with respect to the methods and applications.  Personal Competence  Social Competence  The students can work in small groups to study special tasks and problems and will be enforced to present their results with adequate methods during the exercise.  Autonomy  The students will be able to retrieve information out of the relevant literature in the field and putt hem into the context of the lecture. They can relate their gathered knowledge and relate them to other lectures (signals and systems, digital communication systems, image and video processing, and pattern
Professional Competence  Knowledge  Die Studierenden können die grundlegenden Verfahren und Methoden der digitalen Audiosignalverarbeitung erklären. Sie können die wesentlichen physikalischen Effekte bei der Sprach- und Audiosignalverarbeitung erläutern und in Kategorien einordnen. Lecturer	Prof. Udo Zölzer
Language	EN
Cycle	WiSe
Content	Introduction (Studio Technology, Digital Transmission Systems, Storage Media, Audio Components at Home)
	Quantization (Signal Quantization, Dither, Noise Shaping, Number Representation)
	AD/DA Conversion (Methods, AD Converters, DA Converters, Audio Processing Systems, Digital Signal Processors, Digital Audio Interfaces, Single-Processor Systems, Multiprocessor Systems)
	Equalizers (Recursive Audio Filters, Nonrecursive Audio Filters, Multi-Complementary Filter Bank)
	Room Simulation (Early Reflections, Subsequent Reverberation, Approximation of Room Impulse Responses)
	Dynamic Range Control (Static Curve, Dynamic Behavior, Implementation, Realization Aspects)
	Sampling Rate Conversion (Synchronous Conversion, Asynchronous Conversion, Interpolation Methods)
	Data Compression (Lossless Data Compression, Lossy Data Compression, Psychoacoustics, ISO-MPEG1 Audio Coding)

Courses				
Courses		Tun	Heaturk	O.D.
Title Pattern Recognition and Data Compressic	in (I 0128)	<b>Typ</b> Lecture	Hrs/wk 4	<b>CP</b> 6
Module Responsible	Prof. Rolf-Rainer Grigat	Ecolare	7	
Admission Requirements	Floi. Holi-halilet Gligat			
Recommended Previous	Linear algebra (including PCA, unitary transforms), stocha-	etice and etatietics, hinary arithmetics		
Knowledge	Elliear algebra (ilicidumg i OA, umtary transforms), stocina	sucs and statistics, binary antimetics		
Educational Objectives	After taking part successfully, students have reached the fo	llowing learning results		
Professional Competence				
Knowledge	Students can name the basic concepts of pattern recognition	on and data compression.		
		·		
	Students are able to discuss logical connections between	the concepts covered in the course and to	explain them by means of ex	amples.
Skills	Students can apply statistical methods to classification prol			
	methodical basis they can analyze characteristic value as	-	·	-
	are able to use highly sophisticated methods and proces multidimensional decision-making areas.	ses of the subject area. Students are ca	apable of assessing different	solution approaches i
	multidimensional decision-making areas.			
Personal Competence				
Social Competence				
Autonomy	Students are capable of identifying problems independent	ly and of solving them scientifically, using	the methods they have learnt

Recommended Previous Students are expected to have a solid knowledge of object-oriented progra	amming as well as of linear	algebra and geometry.	
Knowledge	-		
Educational Objectives  After taking part successfully, students have reached the following learning	g results		
Professional Competence			
Knowledge Students have acquired a theoretical basis in computer graphics and have	a clear understanding of th	ie process of computer anir	mation.
	•		
Skills Students have acquired			
solid skills in modelling and shading,			
solid skills in computer animation techniques, and			
a thorough command of Maya, a first-class animation system.			
Personal Competence			
Social Competence Students are trained in communicating abstract ideas and are familiar with	nlanning and conducting n	rojects within a small team	
otadonio dio talino in communicating about dodo and dio talinial with	planning and conducting p	rojecto within a sinan team.	
Autonomy Students are able to direct complex computer animation projects.

Content	Computer graphics and animation are leading to an unprecedented visual revolution. The course deals with its technological foundations:
	Object-oriented Computer Graphics
	Projections and Transformations
	Polygonal and Parametric Modelling
	Illuminating, Shading, Rendering
	Computer Animation Techniques
	Kinematics and Dynamics Effects
	Students will be be working on a series of mini-projects which will eventually evolve into a final project. Learning computer graphics and animation
	resembles learning a musical instrument. Therefore, doing your projects well and in time is essential for performing well on this course.

Educational	After taking part successfully, students have reached the following learning results			
Objectives				
Professional				
Competence Knowledge				
Knowledge	Students explain the different phases of testing, describe fundamenta	l		
	techniques of different types of testing, and paraphrase the basic			
	principles of the corresponding test process. They give examples of			
	software development scenarios and the corresponding test type and	I		
	technique. They explain algorithms used for particular testing			
	techniques and describe possible advantages and limitations.			
Skills	Students identify the appropriate testing type and technique for a give	n		
	problem. They adapt and execute respective algorithms to execute a			
	concrete test technique properly. They interpret testing results and			
	execute corresponding steps for proper re-test scenarios. They write	and		
	analyze test specifications. They apply bug finding techniques for			
	non-trivial problems.			
Personal				
Competence				
Social	Students discuss relevant topics in class. They defend their solutions orally.			
Competence	They communicate in English.			
Autonomy	Students can assess their level of knowledge continuously and adjust it appropriate

Educational Objectives	After taking part successfully, students have reached the follow	wing learning results		
Professional Competence				
Knowledge	Students can explain and describe the field of projective geon	netry.		
Skills	Students are capable of			
	Implementing an exemplary 3D or volumetric analysis			
	Using highly sophisticated methods and procedures or	f the subject area		
	Identifying problems and	attau.		
	Developing and implementing creative solution sugge	stions.		
	With assistance from the teacher students are able to link the	contents of the three subject areas (modules)		
	Digital Image Analysis			
	Pattern Recognition and Data Compression			
	and			
	3D Computer Vision			
	in practical assignments.			
Personal Competence				
Social Competence	Students can collaborate in a small team on the practical re	ealization and testing of a system to reconstr	uct a three-dimension	nal scene or to evalu
	volume data sets.			
Autonomy	Students are able to solve simple tasks independently with re-	ference to the contents of the lectures and the	exercise sets.	
	Students are able to solve detailed problems independently w	vith the aid of the tutorial's programming task.

Cycle	WiSe
Content	<ul> <li>Projective Geometry and Transformations in 2D und 3D in homogeneous coordinates</li> <li>Projection matrix, calibration</li> <li>Epipolar Geometry, fundamental and essential matrices, weak calibration, 5 point algorithm</li> <li>Homographies 2D and 3D</li> <li>Trifocal Tensor</li> <li>Correspondence search</li> </ul>
Literature	Skriptum Grigat/Wenzel     Hartley, Zisserman: Multiple View Geometry in Computer Vision. Cambridge 2003.

Course L0130: 3D Computer Vision	
Тур	Recitation Section (small)
Hrs/wk	2
CP	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Rolf-Rainer Grigat
Language	EN
Cycle	WiSe
Content	See interlocking course
Literature	See interlocking course

## Thesis

Module M-002: Master Thesis		
Courses		
Title	Typ Hrs/wk CP	
Module Responsible	Professoren der TUHH	
Admission Requirements		
	According to General Regulations §24 (1):	
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.	
Recommended Previous		
Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized issues.	
	The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject, describing current	
	developments and taking up a critical position on them.	
	The students can place a research task in their subject area in its context and describe and critically assess the state of research.	
···		
Skills	The students are able:	
	To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question.	
	To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incompletely defined.	
	problems in a solution-oriented way.	
	<ul> <li>To develop new scientific findings in their subject area and subject them to a critical assessment.</li> </ul>	
Personal Competence		
Social Competence	Students can	
	Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way.	
	Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholding their	
	own assessments and viewpoints convincingly.	
A. 4	On the state of th	
Autonomy	Students are able:	
	To structure a project of their own in work packages and to work them off accordingly.	
	To work their way in depth into a largely unknown subject and to access the information required for them to do so.	
	To apply the techniques of scientific work comprehensively in research of their own.	
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0	
Credit points	30	
Examination		
Examination duration and scale		
Assignment for the Following Curricula	Civil Engineering: Thesis: Compulsory Bioprocess Engineering: Thesis: Compulsory	
Curricula	Chemical and Bioprocess Engineering: Thesis: Compulsory	
	Computer Science: Thesis: Compulsory	
	Electrical Engineering: Thesis: Compulsory	
	Energy and Environmental Engineering: Thesis: Compulsory	
	Energy Systems: Thesis: Compulsory  Environmental Engineering: Thesis: Compulsory	
	Environmental Engineering: Thesis: Compulsory  Aircraft Systems Engineering: Thesis: Compulsory	
	Global Innovation Management: Thesis: Compulsory	
	Computational Science and Engineering: Thesis: Compulsory	
	Information and Communication Systems: Thesis: Compulsory	
	International Production Management: Thesis: Compulsory	
	International Management and Engineering: Thesis: Compulsory  Joint European Master in Environmental Studies - Cities and Sustainability: Thesis: Compulsory	
	Logistics, Infrastructure and Mobility: Thesis: Compulsory	
	Materials Science: Thesis: Compulsory	
	Mechanical Engineering and Management: Thesis: Compulsory	
	Mechatronics: Thesis: Compulsory	
	Biomedical Engineering: Thesis: Compulsory	
	Microelectronics and Microsystems: Thesis: Compulsory  Product Development Materials and Production: Thesis: Compulsory	
	Product Development, Materials and Production: Thesis: Compulsory  Renewable Energies: Thesis: Compulsory	
	Naval Architecture and Ocean Engineering: Thesis: Compulsory	
	Ship and Offshore Technology: Thesis: Compulsory	
	Theoretical Mechanical Engineering: Thesis: Compulsory	
	Process Engineering: Thesis: Compulsory	
	Water and Environmental Engineering: Thesis: Compulsory
