Module M0677: Digital Signal Processing and Digital Filters	47
Thesis	49
Module M-002: Master Thesis	49

Program description

Content

Microelectronics, or better named nanoelectronics, because the minimum structure size of state-of-the-art integrated electronic circuits are in the range of 20 nm and below, is the base of the products that significantly influence the daily life of people almost anywhere on earth. Examples are personal computers and smartphones. Both of them open up new possibilities of communication and give access to almost unlimited sources of information, especially when those devices are connected to the world wide web. Another example are medical diagnostic tools for computer tomography or nuclear resonance tomography or intelligent medical implants as all these systems are based on the high computational performance and high data communication efficiency provided by advanced nanoelectronics.

The fundament for microelectronics and microsystems is semiconductor physics and technology. Thus, the objective of the International Master Program "Microelectronics and Microsystems" is to give the students a profound knowledge on physical level about electronic effects in semiconductor materials, especially silicon, and on the functionality of electronic devices. Furthermore, the students are taught about process technology for fabrication of integrated circuits and microsystems. This will enable the students to understand in depth the function of advanced electronic devices and fabrication processes. They will be able to comprehend in a critical way the problems accompanied with the transition to smaller minimum structure sizes. Thus, the students can conceive which possible solutions may exist or could be developed to overcome the problems of scaling-down the device minimum feature size. This will enable the students to understand the ongoing scaling-down of MOS transistors with its potential but also with its limitations.

Besides the essential role of physical basics the precise knowledge of process dependent manufacturing procedures are of key importance for training of the students in the field of nanoelectronics and microsystems. This will help them to develop during their professional life the ability to generate innovative concepts and bring them to practical applications.

The International Master Program "Microelectronics and Microsystems" qualifies the students for scientific professional work in the fields of electrical engineering and information technology. This professional work may extend from the development, production and application to the quality control of complex systems with highly integrated circuits and microsystems components. Both fields are coming closer and closer together, as a fast rising number of complex applications requires the integration of nanoelectronics and microsystems to one combined system.

In particular, this program enables the students not only to design new complex systems for innovative applications, but also to make them usable for practical applications. This can be realized by teaching the students engineering methods both on a physical and theoretical level and on an application oriented level.

Career prospects

The graduates of the International Master Program "Microelectronics and Microsystems" can find a wide variety of professional options as they have well founded knowledge about technology, design and application of highly integrated systems based on nanoelectronics and microsystems.

Thus, one group of possible employers are large companies with international sites for the production of integrated circuits, but also small or medium-sized companies for microsystems. Many job opportunities also exist in the field of development and design of integrated circuits and of microsystems. Because of the fast decline in prices of high-performance computer system, even small companies can conduct tasks that require many computational efforts such as the design of integrated circuits that, then, are fabricated by specialized companies, so-called silicon foundries. This allows many small companies to participate in the market for integrated circuits, so that they can contribute to a good job market for engineers in nanoelectronics and microsystems.

Learning target

Knowledge

- The students understand the basic physical principles of microelectronic devices and functional block of microsystems. Furthermore, they have solid knowledge regarding fabrication technologies, so that they can explain them in detail.
- They have gained solid knowledge in selected fields based on a broad theoretical and methodical fundament.
- The students possess in-depth knowledge of interdisciplinary relationships.
- They have the required background knowledge in order to position their professional subjects by appropriate means in the scientific and social environment.

Skills

The students are able

- to apply computational methods for quantitative analysis of design parameters and for development of innovative systems for microelectronics and microsystems.
- to solve complex problems and tasks in a self-dependent manner by basic methodical approaches that may be, if necessary, beyond the standard patterns
- to consider technological progress and scientific advancements by taking into account the technical, financial and ecological boundary conditions.

Social Skills

The students are capable of

- working in interdisciplinary teams and organizing their tasks in a process oriented manner to become prepared for conducting research based professional work and for taking management responsibilities.
- to present their results in a written or oral form effectively targeting the audience, on international stage also.

Autonomy

- The students can pervade in an effectively and self-dependently organized way special areas of their professional fields using scientific methods.
- They are able to present their knowledge by appropriate media techniques or to describe it by documents with reasonable lengths.
- The students are able to identify the need for additional information and to develop a strategy for self-dependent enhancement of their knowledge.

Program structure

The curriculum of the International Master Program "Microelectronics and Microsystems" is structured as follows:

- Core Qualification:
- Main subject: The students choose one main subject out of the following two options:

The students have to take for their main subjects moduls totaling 18 CPs (1. - 3. semester).

• Master thesis with 30 CP (4. semester)

The sum of required credit points of this Master program is 120 CP.

Core qualification

Module M0523: Business	& Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge Skills	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Personal Competence Social Competence Autonomy	• Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter			
Admission Requirements	None			
Recommended Previous Knowledge	None			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	The Nontechnical Academic Programms (NTA)			
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance management, collaboration and professional and personnel management competences. The department implements these training object its teaching architecture , in its teaching and learning arrangements , in teaching areas and by means of teaching offerings in which stu- can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are poor two different catalogues for nontechnical complementary courses.			
	The Learning Architecture			
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical aca programms follow the specific profiling of TUHH degree courses.			
	The learning architecture demands and trains independent educational planning as regards the individual development of competences. provides orientation knowledge in the form of "profiles".			
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semest view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university a order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters of the course of studies.			
	Teaching and Learning Arrangements			
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealin interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in s courses.			
	Fields of Teaching			
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication st migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.			
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-or communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.			
	The Competence Level			
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differenc reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientif theoretical level of abstraction in the B.Sc.			
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions Bachelor's and Master's graduates in their future working life.			
	Specialized Competence (Knowledge)			
	Students can			
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning a different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject. 			
Skills	Professional Competence (Skills)			
	In selected sub-areas students can			
	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a successful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relations the subject. 			

Personal Competence

Social Competence	Personal Competences (Social Skills)
	Students will be able
	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	• to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	 to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly
	 to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
	Depends on choice of courses
Credit points	6

Content	Introduction (historical view, scientific and economic relevance, scaling laws)
	 Semiconductor Technology Basics, Lithography (wafer fabrication, photolithography, improving resolution, next-generation lithography, nano-imprinting, molecular imprinting)
	 Deposition Techniques (thermal oxidation, epitaxy, electroplating, PVD techniques: evaporation and sputtering; CVD techniques: APCVD, LPCVD, PECVD and LECVD; screen printing)
	 Etching and Bulk Micromachining (definitions, wet chemical etching, isotropic etch with HNA, electrochemical etching, anisotropic etching with KOH/TMAH: theory, corner undercutting, measures for compensation and etch-stop techniques; plasma processes, dry etching: back sputtering, plasma etching, RIE, Bosch process, cryo process, XeF2 etching)
	 Surface Micromachining and alternative Techniques (sacrificial etching, film stress, stiction: theory and counter measures; Origam microstructures, Epi-Poly, porous silicon, SOI, SCREAM process, LIGA, SU8, rapid prototyping) Thermal and Rediction Sensors (temperature measurement cell concerting concerts Sensors) Sensors (feat and thermapile; medulating concerts).
	 Thermal and Radiation Sensors (temperature measurement, self-generating sensors: Seebeck effect and thermopile; modulating sensors thermo resistor, Pt-100, spreading resistance sensor, pn junction, NTC and PTC; thermal anemometer, mass flow sensor, photometry radiometry, IR sensor: thermopile and bolometer)
	 Mechanical Sensors (strain based and stress based principle, capacitive readout, piezoresistivity, pressure sensor: piezoresistive capacitive and fabrication process; accelerometer: piezoresistive, piezoelectric and capacitive; angular rate sensor: operating principle and fabrication process) Magnetic Sensors (galvanomagnetic sensors: spinning current Hall sensor and magneto-transistor; magnetoresistive sensors: magnetic sensors: ma
	 resistance, AMR and GMR, fluxgate magnetometer) Chemical and Bio Sensors (thermal gas sensors: pellistor and thermal conductivity sensor; metal oxide semiconductor gas sensor, organi semiconductor gas sensor, Lambda probe, MOSFET gas sensor, pH-FET, SAW sensor, principle of biosensor, Clark electrode, enzyme electrode, DNA chip)
	 Micro Actuators, Microfluidics and TAS (drives: thermal, electrostatic, piezo electric and electromagnetic; light modulators, DMD, adaptiv optics, microscanner, microvalves: passive and active, micropumps, valveless micropump, electrokinetic micropumps, micromixer, filte inkjet printhead, microdispenser, microfluidic switching elements, microreactor, lab-on-a-chip, microanalytics)
	 MEMS in medical Engineering (wireless energy and data transmission, smart pill, implantable drug delivery system, stimulators microelectrodes, cochlear and retinal implant; implantable pressure sensors, intelligent osteosynthesis, implant for spinal corregeneration)
	 Design, Simulation, Test (development and design flows, bottom-up approach, top-down approach, testability, modelling: multiphysic: FEM and equivalent circuit simulation; reliability test, physics-of-failure, Arrhenius equation, bath-tub relationship) System Integration (monolithic and hybrid integration, assembly and packaging, dicing, electrical contact: wire bonding, TAB and flip chi bonding; packages, chip-on-board, wafer-level-package, 3D integration, wafer bonding: anodic bonding and silicon fusion bonding; micr electroplating, 3D-MID)

Specialization Communication and Signal Processing

Students of the specialization Communication and Signal Processing learn both physical and technical basics of state-of-the-art wired and wireless communication systems and the hardware realization of those systems. They can deepen their knowledge towards core areas such as systems for audio or video signal processing. The students understand the fundamental concepts of those systems and can identify their limitations. Based on this knowledge they are able to determine possible improvements and to implement them.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

Content	The lecture deals with technical principles and related concepts of mobile communications. In this context, the main focus is put on the physical
	and data link layer of the ISO-OSI stack.
	In the lecture, the transmission medium, i.e., the mobile radio channel, serves as the starting point of all considerations. The characteristics and the
	mathematical descriptions of the radio channel are discussed in detail. Subsequently, various physical layer aspects of wireless transmission are
	covered, such as channel coding, modulation/demodulation, channel estimation, synchronization, and equalization. Moreover, the different uses
	of multiple antennas at the transmitter and receiver, known as MIMO techniques, are described. Besides these physical layer topics, concepts of
	multiple access schemes in a cellular network are outlined.
	In order to illustrate the above-mentioned technical solutions, the lecture will also provide a system view, highlighting the basics of some
	contemporary wireless systems, including UMTS/HSPA, LTE, LTE Advanced, and WiMAX.

Module M0550: Digital Ima	age Analysis		
Courses			
litle	Тур	Hrs/wk	CP
Digital Image Analysis (L0126)	Lecture	4	6
Module Responsible	Prof. Rolf-Rainer Grigat		
Admission Requirements	None		
Recommended Previous	System theory of one-dimensional signals (convolution and correlation, sampling theory, interpolation and	d decimation, Fo	ourier transform, lin
Knowledge	time-invariant systems), linear algebra (Eigenvalue decomposition, SVD), basic stochastics and statistics (e	xpectation value	s, influence of sam
	size, correlation and covariance, normal distribution and its parameters), basics of Matlab, basics in optics		
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
	Students can		
	Describe imaging processes		
	Depict the physics of sensorics		
	Explain linear and non-linear filtering of signals		
	Establish interdisciplinary connections in the subject area and arrange them in their context		
	 Interpret effects of the most important classes of imaging sensors and displays using mathematical m 	ethods and phys	sical models.
Skills	Students are able to		
	Use highly sophisticated methods and procedures of the subject area		
	 Identify problems and develop and implement creative solutions. 		
	Students can solve simple arithmetical problems relating to the specification and design of image processing	a and image ane	llysis systems.
		, 0	
	Students are able to assess different solution approaches in multidimensional decision-making areas.		
	Students can undertake a prototypical analysis of processes in Matlab.		
Personal Competence			
Social Competence	k.A.		
Autonomy	Students can solve image analysis tasks independently using the relevant literature.

Specialization Microelectronics Complements

Students of the specialization Microelectronics Complements expand their knowledge towards the application of microelectronics and microsystems for medical use, the processing of digital signals, the development and design of highly complex integrated systems and networks for optical communication. Thus, they strengthen their knowledge by analyzing practical applications and link it up with the requirements of technical realizations.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

	• Tundamentais of spectral transionins (Fourier series,			
Educational Objectives	After taking part successfully, students have reached the follo	owing learning results		
Professional Competence				
Knowledge	The students know and understand basic algorithms of dig	ital signal processing. They are familiar	with the spectral tra	nsforms of discrete-time
	signals and are able to describe and analyse signals and	systems in time and image domain. The	y know basic structu	ires of digital filters and
	can identify and assess important properties including stal	bility. They are aware of the effects caus	sed by quantization	of filter coefficients and
	signals. They are familiar with the basics of adaptive filters	. They can perform traditional and parar	metric methods of sp	ectrum estimation, also
	taking a limited observation window into account.			
Skills	The students are able to apply methods of digital signal processing to new problems. They can choose and parameterize suitable filter striuctures.			
	In particular, the can design adaptive filters according to the minimum mean squared error (MMSE) criterion and develop an efficient			
	implementation, e.g. based on the LMS or RLS algorithm. F	urthermore, the students are able to apply	methods of spectrum	m estimation and to take
	the effects of a limited observation window into account.			
Personal Competence				
Social Competence	The students can jointly solve specific problems.			
Autonomy	The students are able to acquire relevant information from	appropriate literature sources. They can	control their level c	of knowledge during the
	lecture period by solving tutorial problems, software tools, cli	cker system.

Courses	
Title	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	According to General Regulations §24 (1):
	At least 70 gradit points have to be achieved in study programme. The even institute board desides an eventions
	At least 78 credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	• The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized issues.
	• The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject, describing cur
	developments and taking up a critical position on them.
	• The students can place a research task in their subject area in its context and describe and critically assess the state of research.
21.11	
Skills	The students are able:
	• To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question.
	• To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incomple
	defined problems in a solution-oriented way.
	 To develop new scientific findings in their subject area and subject them to a critical assessment.
Personal Competence	
Social Competence	Students can
	Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way.
	 Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholo their own economic and view points convincingly.
	their own assessments and viewpoints convincingly.
Autonomy	Students are able:
hatonomy	
	 To structure a project of their own in work packages and to work them off accordingly.
	• To work their way in depth into a largely unknown subject and to access the information required for them to do so.
	 To apply the techniques of scientific work comprehensively in research of their own.
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
Credit points	30
Examination	according to Subject Specific Regulations
Examination duration and scale	see FSPO
Assignment for the Following	Civil Engineering: Thesis: Compulsory
Curricula	Bioprocess Engineering: Thesis: Compulsory
	Chemical and Bioprocess Engineering: Thesis: Compulsory
	Computer Science: Thesis: Compulsory
	Electrical Engineering: Thesis: Compulsory
	Energy and Environmental Engineering: Thesis: Compulsory
	Energy Systems: Thesis: Compulsory Environmental Engineering: Thesis: Compulsory
	Aircraft Systems Engineering: Thesis: Compulsory
	Global Innovation Management: Thesis: Compulsory
	Computational Science and Engineering: Thesis: Compulsory
	Information and Communication Systems: Thesis: Compulsory
	International Production Management: Thesis: Compulsory
	International Management and Engineering: Thesis: Compulsory
	Joint European Master in Environmental Studies - Cities and Sustainability: Thesis: Compulsory
	Logistics, Infrastructure and Mobility: Thesis: Compulsory
	Materials Science: Thesis: Compulsory
	Mechanical Engineering and Management: Thesis: Compulsory
	Mechatronics: Thesis: Compulsory
	Biomedical Engineering: Thesis: Compulsory Microelectronics and Microsystems: Thesis: Compulsory
	Product Development, Materials and Production: Thesis: Compulsory
	Renewable Energies: Thesis: Compulsory
	Naval Architecture and Ocean Engineering: Thesis: Compulsory

Ship and Offshore Technology: Thesis: Compulsory
Theoretical Mechanical Engineering: Thesis: Compulsory
Process Engineering: Thesis: Compulsory
Water and Environmental Engineering: Thesis: Compulsory
