Core qualification	5
Module M0523: Business & Management	5
Module M0524: Nontechnical Elective Complementary Courses for Master	6
Module M0913: CMOS Nanoelectronics with Practice	8
Module M1048: Electronic Devices and Circuits	10
Module M0746: Microsystem Engineering	12
Module M0768: Microsystems Technology in Theory and Practice	14
Module M1137: Technical Elective Complementary Course for IMPMM - field ET (according to Subject Specific Regulations)	16
Module M0930: Semiconductor Seminar	17
Module M0747: Microsystem Design	18
Module M0918: Fundamentals of IC Design	20
Module M0919: Laboratory: Analog and Digital Circuit Design	22
Module M1130: Project Work IMPMM	24
Module M0678: Seminar Communications Engineering	25
Module M1131: Technical Elective Complementary Course for IMPMM - field TUHH (according to Subject Specific Regulation	is)
Specialization Communication and Signal Processing 27	726
Module M0836: Communication Networks I - Analysis and Structure	27
Module M0710: Microwave Engineering	29
Module M0645: Fibre and Integrated Optics	31
Module M0637: Advanced Concepts of Wireless Communications	32
Module M0552: 3D Computer Vision	34
Module M0738: Digital Audio Signal Processing	36
Module M0550: Digital Image Analysis	38
Specialization Microelectronics Complements	40
Module M0921: Electronic Circuits for Medical Applications	40
Module M0643: Optoelectronics I - Wave Optics	43
Module M0644: Optoelectronics II - Quantum Optics	45
Module M0925: Design of Highly Complex Integrated Systems and CAD Tools	47
Module M0677: Digital Signal Processing and Digital Filters	48
Thesis	50
Module M-002: Master Thesis	50

## **Module Manual**

# Master Microelectronics and Microsystems

Cohort: Winter Term 2017

Updated: 25th August 2018

### **Program description**

#### Content

Microelectronics, or better named nanoelectronics, because the minimum structure size of state-of-the-art integrated electronic circuits are in the range of 20 nm and below, is the base of the products that significantly influence the daily life of people almost anywhere on earth. Examples are personal computers and smartphones. Both of them open up new possibilities of communication and give access to almost unlimited sources of information, especially when those devices are connected to the world wide web. Another example are medical diagnostic tools for computer tomography or nuclear resonance tomography or intelligent medical implants as all these systems are based on the high computational performance and high data communication efficiency provided by advanced nanoelectronics.

The fundament for microelectronics and microsystems is semiconductor physics and technology. Thus, the objective of the International Master Program "Microelectronics and Microsystems" is to give the students a profound knowledge on physical level about electronic effects in semiconductor materials, especially silicon, and on the functionality of electronic devices. Furthermore, the students are taught about process technology for fabrication of integrated circuits and microsystems. This will enable the students to understand in depth the function of advanced electronic devices and fabrication processes. They will be able to comprehend in a critical way the problems accompanied with the transition to smaller minimum structure sizes. Thus, the students can conceive which possible solutions may exist or could be developed to overcome the problems of scaling-down the device minimum feature size. This will enable the students to understand the ongoing scaling-down of MOS transistors with its potential but also with its limitations.

Besides the essential role of physical basics the precise knowledge of process dependent manufacturing procedures are of key importance for training of the students in the field of nanoelectronics and microsystems. This will help them to develop during their professional life the ability to generate innovative concepts and bring them to practical applications.

The International Master Program "Microelectronics and Microsystems" qualifies the students for scientific professional work in the fields of electrical engineering and information technology. This professional work may extend from the development, production and application to the quality control of complex systems with highly integrated

circuits and microsystems components. Both fields are coming closer and closer together, as a fast rising number of complex applications requires the integration of nanoelectronics and microsystems to one combined system.

In particular, this program enables the students not only to design new complex systems for innovative applications, but also to make them usable for practical applications. This can be realized by teaching the students engineering methods both on a physical and theoretical level and on an application oriented level.

#### **Career prospects**

The graduates of the International Master Program "Microelectronics and Microsystems" can find a wide variety of professional options as they have well founded knowledge about technology, design and application of highly integrated systems based on nanoelectronics and microsystems.

Thus, one group of possible employers are large companies with international sites for the production of integrated circuits, but also small or medium-sized companies for microsystems. Many job opportunities also exist in the field of development and design of integrated circuits and of microsystems. Because of the fast decline in prices of high-performance computer system, even small companies can conduct tasks that require many computational efforts such as the design of integrated circuits that, then, are fabricated by specialized companies, so-called silicon foundries. This allows many small companies to participate in the market for integrated circuits, so that they can contribute to a good job market for engineers in nanoelectronics and microsystems.

#### Learning target

#### Knowledge

- The students understand the basic physical principles of microelectronic devices and functional block of microsystems. Furthermore, they have solid knowledge regarding fabrication technologies, so that they can explain them in detail.
- They have gained solid knowledge in selected fields based on a broad theoretical and methodical fundament.
- The students possess in-depth knowledge of interdisciplinary relationships
- They have the required background knowledge in order to position their professional subjects by appropriate means in the scientific and social environment.

#### Skills

The students are able

- to apply computational methods for quantitative analysis of design parameters and for development of innovative systems for microelectronics and microsystems.
- to solve complex problems and tasks in a self-dependent manner by basic methodical approaches that may be, if necessary, beyond the standard patterns
- to consider technological progress and scientific advancements by taking into account the technical, financial and ecological boundary conditions.

#### Social Skills

The students are capable of

- working in interdisciplinary teams and organizing their tasks in a process oriented manner to become prepared for conducting research based professional work and for taking management responsibilities.
- to present their results in a written or oral form effectively targeting the audience, on international stage also.

#### Autonomy

- The students can pervade in an effectively and self-dependently organized way special areas of their professional fields using scientific methods.
- They are able to present their knowledge by appropriate media techniques or to describe it by documents with reasonable lengths.
- The students are able to identify the need for additional information and to develop a strategy for self-dependent enhancement of their knowledge.

#### **Program structure**

The curriculum of the International Master Program "Microelectronics and Microsystems" is structured as follows:

- Core Qualification:
- Main subject: The students choose one main subject out of the following two options:

The students have to take for their main subjects moduls totaling 18 CPs (1. - 3. semester).

• Master thesis with 30 CP (4. semester)

The sum of required credit points of this Master program is 120 CP.

## **Core qualification**

lulo M0522 : Rusinoss	8. Managamant
lule M0523: Business	a management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	<ul> <li>Students are able to find their way around selected special areas of management within the scope of business management.</li> <li>Students are able to explain basic theories, categories, and models in selected special areas of business management.</li> <li>Students are able to interrelate technical and management knowledge.</li> </ul>
Skills	<ul> <li>Students are able to apply basic methods in selected areas of business management.</li> <li>Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.</li> </ul>
Personal Competence Social Competence	• Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	• Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, management, collaboration and professional and personnel management competences. The department implements these training objectiv its <b>teaching architecture</b> , in its <b>teaching and learning arrangements</b> , in <b>teaching areas</b> and by means of teaching offerings in which stud can qualify by opting for <b>specific competences</b> and a <b>competence level</b> at the Bachelor's or Master's level. The teaching offerings are pool two different catalogues for nontechnical complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical acad programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual development of competences. It provides orientation knowledge in the form of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semester view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university at order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters do the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specourses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication stu migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students o Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-orie communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These difference reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership function Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	<ul> <li>explain specialized areas in context of the relevant non-technical disciplines,</li> <li>outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning an different specialist disciplines relate to their own discipline and differentiate it as well as make connections,</li> <li>sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation ir specialized sciences are subject to individual and socio-cultural interpretation and historicity,</li> <li>Can communicate in a foreign language in a manner appropriate to the subject.</li> </ul>
Skills	Professional Competence (Skills)
	In selected sub-areas students can
	<ul> <li>apply basic and specific methods of the said scientific disciplines,</li> <li>aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,</li> <li>to handle simple and advanced questions in aforementioned scientific disciplines in a successful manner,</li> <li>justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationst the subject.</li> </ul>

Personal Competence

Social Competence	Personal Competences (Social Skills)
	Students will be able
	<ul> <li>to learn to collaborate in different manner,</li> <li>to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,</li> <li>to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),</li> <li>to explain nontechnical items to auditorium with technical background knowledge.</li> </ul>
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	• to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	<ul> <li>to reflect and decide questions in front of a broad education background</li> </ul>
	<ul> <li>to communicate a nontechnical item in a competent way in writen form or verbaly</li> </ul>
	<ul> <li>to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)</li> </ul>

#### **Specialization Communication and Signal Processing**

Students of the specialization Communication and Signal Processing learn both physical and technical basics of state-of-the-art wired and wireless communication systems and the hardware realization of those systems. They can deepen their knowledge towards core areas such as systems for audio or video signal processing. The students understand the fundamental concepts of those systems and can identify their limitations. Based on this knowledge they are able to determine possible improvements and to implement them.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

Fibre and Integrated Optics (Problem So	olving Course) (L0365)	Recitation Section (small)	1	1
Module Responsible	Prof. Manfred Eich			
Admission Requirements	None			
Recommended Previous	Basic principles of electrodynamics and optics			
Knowledge				
Educational Objectives	After taking part successfully, students have reached th	e following learning results		
Professional Competence				
Knowledge	Students can explain the fundamental mathematical and	nd physical relations and technological basics	s of guided optical wa	ves. They can describe
	integrated optical as well as fibre optical structures. T	hey can give an overview on the application	s of integrated optica	l components in optical
	signal processing.			
Skills	Students can generate models and derive mathematica	al descriptions in relation to fibre optical and ir	tearated optical wave	propagation. They can
Okins.	derive approximative solutions and judge factors influe		negrated optical wave	propagation. They can
Personal Competence				
Social Competence	Students can jointly solve subject related problems in g	roups. They can present their results effective	y within the framewor	k of the problem solving
	course.			
Autonomy	Students are capable to extract relevant information fro	om the provided references and to relate this i	nformation to the con	tent of the lecture. They
	can reflect their acquired level of expertise with the he	Ip of lecture accompanying measures such a	s exam typical exam	questions. Students are
	able to connect their knowledge with that acquired from	o other lectures.

Advanced Concepts of Wireless Comm	unications (L0297)	Lecture	3	4
Advanced Concepts of Wireless Comm	unications (L0298)	Recitation Section (large)	1	2
Module Responsible	Dr. Rainer Grünheid			
Admission Requirements	None			
Recommended Previous Knowledge	<ul> <li>Lecture "Signals and Systems"</li> <li>Lecture "Fundamentals of Telecommunications and Lecture "Digital Communications"</li> </ul>	nd Stochastic Processes"		
Educational Objectives	After taking part successfully, students have reached the	following learning results		
Professional Competence				
Knowledge	Students are able to explain the general as well as advanced principles and techniques that are applied to wireless communications. They understand the properties of wireless channels and the corresponding mathematical description. Furthermore, students are able to explain the physical layer of wireless transmission systems. In this context, they are proficient in the concepts of multicarrier transmission (OFDM), modulation error control coding, channel estimation and multi-antenna techniques (MIMO). Students can also explain methods of multiple access. On the example of contemporary communication systems (UMTS, LTE) they can put the learnt content into a larger context.			
Skills	Using the acquired knowledge, students are able to understand the design of current and future wireless systems. Moreover, given certain constraints, they can choose appropriate parameter settings of communication systems. Students are also able to assess the suitability of technical concepts for a given application.			
Personal Competence				
Social Competence Autonomy	Students can jointly elaborate tasks in small groups and present their results in an adequate fashion. Students are able to extract necessary information from given literature sources and put it into the perspective of the lecture. They can continuously check their level of expertise with the help of accompanying measures (such as online tests, clicker questions, exercise tasks) and, based on that, to steer their learning process accordingly. They can relate their acquired knowledge to topics of other lectures, e.g., "Fundamentals of Communications and Stochastic Processes" and "Digital Communications".

Content	The lecture deals with technical principles and related concepts of mobile communications. In this context, the main focus is put on the physical and data link layer of the ISO-OSI stack. In the lecture, the transmission medium, i.e., the mobile radio channel, serves as the starting point of all considerations. The characteristics and the mathematical descriptions of the radio channel are discussed in detail. Subsequently, various physical layer aspects of wireless transmission are covered, such as channel coding, modulation/demodulation, channel estimation, synchronization, and equalization. Moreover, the different uses of multiple antennas at the transmitter and receiver, known as MIMO techniques, are described. Besides these physical layer topics, concepts of multiple access schemes in a cellular network are outlined. In order to illustrate the above-mentioned technical solutions, the lecture will also provide a system view, highlighting the basics of some contemporary wireless systems, including UMTS/HSPA, LTE, LTE Advanced, and WiMAX.

## **Specialization Microelectronics Complements**

Students of the specialization Microelectronics Complements expand their knowledge towards the application of microelectronics and microsystems for medical use, the processing of digital signals, the development and design of highly complex integrated systems and networks for optical communication. Thus, they strengthen their knowledge by analyzing practical applications and link it up with the requirements of technical realizations.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

Digital Signal Processing and Digital Filte Digital Signal Processing and Digital Filte		Lecture Recitation Section (large)	3	4
Module Responsible			·	-
Admission Requirements	None			
Recommended Previous				
Knowledge	<ul> <li>Mathematics 1-3</li> </ul>			
Ũ	<ul> <li>Signals and Systems</li> </ul>			
	Fundamentals of signal and system the			
	<ul> <li>Fundamentals of spectral transforms (F</li> </ul>	Fourier series, Fourier transform, Laplace transform)		
Educational Objectives	After taking part successfully, students have re	ached the following learning results		
Professional Competence				
Knowledge	The students know and understand basic alg	porithms of digital signal processing. They are famili	ar with the spectral tra	unsforms of discrete-tim
	signals and are able to describe and analyse	e signals and systems in time and image domain. T	hey know basic struct	ures of digital filters an
	can identify and assess important properties	including stability. They are aware of the effects ca	aused by quantization	of filter coefficients an
	• •	adaptive filters. They can perform traditional and pa	rametric methods of s	pectrum estimation, als
	taking a limited observation window into accou			
Skills		ital signal processing to new problems. They can cho	•	
	In particular, the can design adaptive filters according to the minimum mean squared error (MMSE) criterion and develop an efficient implementation, e.g. based on the LMS or RLS algorithm. Furthermore, the students are able to apply methods of spectrum estimation and to take			
			ply methods of spectru	im estimation and to tak
Personal Competence	the effects of a limited observation window into	account.		
-	The students can jointly solve specific problem			
Autonomy	The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the			
	lecture period by solving tutorial problems, sof	tware tools, clicker system.		
Workload in Hours	Independent Study Time 124, Study Time in Le	ecture 56		
Credit points	6			
Studienleistung	None

Thesis

ourses	
lle	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	
	According to General Regulations §21 (1):
	At least 60 credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	<ul> <li>The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized issues.</li> <li>The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject, describing cur developments and taking up a critical position on them.</li> <li>The students can place a research task in their subject area in its context and describe and critically assess the state of research.</li> </ul>
Skills	The students are able:
	<ul> <li>To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question.</li> <li>To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incomple defined problems in a solution-oriented way.</li> <li>To develop new scientific findings in their subject area and subject them to a critical assessment.</li> </ul>
Personal Competence	
Social Competence	Students can
	<ul> <li>Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way.</li> <li>Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholo their own assessments and viewpoints convincingly.</li> </ul>
Autonomy	Students are able:
	<ul> <li>To structure a project of their own in work packages and to work them off accordingly.</li> <li>To work their way in depth into a largely unknown subject and to access the information required for them to do so.</li> <li>To apply the techniques of scientific work comprehensively in research of their own.</li> </ul>
