Module Manual

Master

Microelectronics and Microsystems

Cohort: Winter Term 2018

Updated: 28th September 2018

Program description

Content

Microelectronics, or better named nanoelectronics, because the minimum structure size of state-of-the-art integrated electronic circuits are in the range of 20 nm and below, is the base of the products that significantly

influence the daily life of people almost anywhere on earth. Examples are personal computers and smartphones. Both of them open up new possibilities of communication and give access to almost unlimited sources of information, especially when those devices are connected to the world wide web. Another example are medical diagnostic tools for computer tomography or nuclear resonance tomography or intelligent medical implants as all these systems are based on the high computational performance and high data communication efficiency provided by advanced nanoelectronics.

The fundament for microelectronics and microsystems is semiconductor physics and technology. Thus, the objective of the International Master Program "Microelectronics and Microsystems" is to give the students a profound knowledge on physical level about electronic effects in semiconductor materials, especially silicon, and on the functionality of electronic devices. Furthermore, the students are taught about process technology for fabrication of integrated circuits and microsystems. This will enable the students to understand in depth the function of advanced electronic devices and fabrication processes. They will be able to comprehend in a critical way the problems accompanied with the transition to smaller minimum structure sizes. Thus, the students can conceive which possible solutions may exist or could be developed to overcome the problems of scaling-down the device minimum feature size. This will enable the students to understand the ongoing scaling-down of MOS transistors with its potential but also with its limitations.

Besides the essential role of physical basics the precise knowledge of process dependent manufacturing procedures are of key importance for training of the students in the field of nanoelectronics and microsystems. This will help them to develop during their professional life the ability to generate innovative concepts and bring them to practical applications.

The International Master Program "Microelectronics and Microsystems" qualifies the students for scientific professional work in the fields of electrical engineering and information technology. This professional work may extend from the development, production and application to the quality control of complex systems with highly integrated circuits and microsystems components. Both fields are coming closer and closer together, as a fast rising number of complex applications requires the integration of nanoelectronics and microsystems to one combined system.

In particular, this program enables the students not only to design new complex systems for innovative applications, but also to make them usable for practical applications. This can be realized by teaching the students engineering methods both on a physical and theoretical level and on an application oriented level.

Career prospects

The graduates of the International Master Program "Microelectronics and Microsystems" can find a wide variety of professional options as they have well founded knowledge about technology, design and application of highly integrated systems based on nanoelectronics and microsystems.

Thus, one group of possible employers are large companies with international sites for the production of integrated circuits, but also small or medium-sized companies for microsystems. Many job opportunities also exist in the field of development and design of integrated circuits and of microsystems. Because of the fast decline in prices of high-performance computer system, even small companies can conduct tasks that require many computational efforts such as the design of integrated circuits that, then, are fabricated by specialized companies, so-called silicon foundries. This allows many small companies to participate in the market for integrated circuits, so that they can contribute to a good job market for engineers in nanoelectronics and microsystems.

Learning target

Knowledge

• The students understand the basic physical principles of microelectronic devices and functional block of microsystems. Furthermore, they have solid knowledge regarding fabrication technologies, so that they

can explain them in detail.

- They have gained solid knowledge in selected fields based on a broad theoretical and methodical fundament.
- The students possess in-depth knowledge of interdisciplinary relationships.
- They have the required background knowledge in order to position their professional subjects by appropriate means in the scientific and social environment.

Skills

The students are able

- to apply computational methods for quantitative analysis of design parameters and for development of innovative systems for microelectronics and microsystems.
- to solve complex problems and tasks in a self-dependent manner by basic methodical approaches that may be, if necessary, beyond the standard patterns
- to consider technological progress and scientific advancements by taking into account the technical, financial and ecological boundary conditions.

Social Skills

The students are capable of

- working in interdisciplinary teams and organizing their tasks in a process oriented manner to become prepared for conducting research based professional work and for taking management responsibilities.
- to present their results in a written or oral form effectively targeting the audience, on international stage also.

Autonomy

- The students can pervade in an effectively and self-dependently organized way special areas of their professional fields using scientific methods.
- They are able to present their knowledge by appropriate media techniques or to describe it by documents with reasonable lengths.
- The students are able to identify the need for additional information and to develop a strategy for selfdependent enhancement of their knowledge.

Program structure

The curriculum of the International Master Program "Microelectronics and Microsystems" is structured as follows:

- Core Qualification:
- Main subject: The students choose one main subject out of the following two options:
- •

The students have to take for their main subjects moduls totaling 18 CPs (1. - 3. semester).

• Master thesis with 30 CP (4. semester)

The sum of required credit points of this Master program is 120 CP.

Core qualification

| Module M0523: B | Business & Management |
|-----------------------------------|---|
| Module Responsible | |
| Admission Requirements | None |
| Recommended Previous Knowledge | None |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge. |
| Skills | Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management. |
| Personal Competence | |
| Social Competence | Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems |
| Autonomy | Students are capable of acquiring necessary knowledge independently by means of research and preparation of material. |
| Workload in Hours | Depends on choice of courses |
| Credit points | 6 |

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

| Module Responsible | Dagmar Richter |
|-----------------------------------|--|
| Admission Requirements | None |
| Recommended Previous Knowledge | None |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Competence | The Nontechnical Academic Programms (NTA) |
| | imparts skills that, in view of the TUHH's training profile, professional engineering studi require but are not able to cover fully. Self-reliance, self-management, collaboration are professional and personnel management competences. The department implements the training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting to specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementa courses. |
| | The Learning Architecture |
| | consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses. |
| | The learning architecture demands and trains independent educational planning as regar the individual development of competences. It also provides orientation knowledge in the for of "profiles". |
| | The subjects that can be studied in parallel throughout the student's entire study program need be, it can be studied in one to two semesters. In view of the adaptation problems the individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is obligation to study these subjects in one or two specific semesters during the course studies. |
| | Teaching and Learning Arrangements |
| | provide for students, separated into B.Sc. and M.Sc., to learn with and from each other acro semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learnin in courses are part of the learning architecture and are deliberately encouraged in speci courses. |
| Knowledge | Fields of Teaching |
| <i>Nitowieuge</i> | are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, communication studies, migration studies and sustainability researce and from engineering didactics. In addition, from the winter semester 2014/15 students on Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way. |
| | The fields of teaching are augmented by soft skills offers and a foreign language offer. Here the focus is on encouraging goal-oriented communication skills, e.g. the skills required outgoing engineers in international and intercultural situations. |
| | The Competence Level |

| | a dambara Initarettu di Tachanbara |
|-----------------------|---|
| | of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc. This is also reflected in the different quality of soft skills, which relate to the different team |
| | positions and different group leadership functions of Bachelor's and Master's graduates in their future working life. |
| | Specialized Competence (Knowledge) |
| | Students can |
| | explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject. |
| | Professional Competence (Skills) |
| | In selected sub-areas students can |
| Skills | apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject. |
| Persona Competence | Personal Competences (Social Skills) |
| | Students will be able |
| Social Competence | to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen). |
| | Personal Competences (Self-reliance) Students are able in selected areas |
| | • to reflect on their own profession and professionalism in the context of real-life fields of |

| Autonomy | application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) |
|-------------------|--|
| Workload in Hours | Depends on choice of courses |
| Credit points | 6 |

| Courses | |
| Title | Typ Hrs/wk CP |
| | Prof. Hoc Khiem Trieu |
| Admission Requirements | None |
| | Basic knowledge in electrical enginnering, physics, semiconductor devices and mathematics at Bachelor of Science level |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | As this modul can be chosen from the modul catalogue of the department E, the competence to be acquired is acccording to the chosen subject. |
| Skills | As this modul can be chosen from the modul catalogue of the department E, the skills to be acquired is acccording to the chosen subject. |
| Personal Competence | |
| Social Competence | Students can team up with one or several partners who may have differen professional backgrounds Students are able to work by their own or in small groups for solving problems and answer scientific questions. |
| Autonomy | Students are able to assess their knowledge in a realistic manner. The students are able to draw scenarios for estimation of the impact of advanced mobile electronics on the future lifestyle of the society. |
| Workload in Hours | Depends on choice of courses |
| Credit points | 6 |
| Assignment for the Following Curricula | |

| Educational Objectives | After taking part successfu | ully, students have re | eached the following | learning resul | ts |
| Professional Competence | | | | | |
| Knowledge | The students know about the most important and most common simulation and design methods used in microsystem design. The scientific background of finite element methods and the basic theory of these methods are known. | | | | - |
| Skills | Students are able to apply simulation methods and commercial simulators in a goal oriented approach to complex design tasks. Students know to apply the theory in order achieve estimates of expected accuracy and can judge and verify the correctness of results. Students are able to develop a design approach even if only incomplete information about material data or constraints are available. Student can make use of approximate and reduced order models in a preliminary design stage or a system simulation. | | | | |
| Personal Competence | | | | | |
| | | ve specific problems | s alone or in a group | o and to prese | ent the results |
| Social Competence | Students are able to solve specific problems alone or in a group and to present the results accordingly. Students can develop and explain their solution approach and subdivide the design task to subproblems which are solved separately by group members. | | | | |
| Autonomy | Students are able to acquire particular knowledge using specialized literature and to integrate and associate this knowledge with other fields. | | | | |

Specialization Communication and Signal Processing

Students of the specialization Communication and Signal Processing learn both physical and technical basics of state-of-the-art wired and wireless communication systems and the hardware realization of those systems. They can deepen their knowledge towards core areas such as systems for audio or video signal processing. The students understand the fundamental concepts of those systems and can identify their limitations. Based on this knowledge they are able to determine possible improvements and to implement them.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

Module M0836: Communication Networks

| Courses | | | | | | |
|-----------------------------------|---|------------------------------------|--------|----|--|--|
| Title | | Тур | Hrs/wk | СР | | |
| Analysis and Structure of | Communication Networks (L0897) | Lecture | 2 | 2 | | |
| Selected Topics of Comm | unication Networks (L0899) | Project-/problem-based Learning | 2 | 2 | | |
| Communication Networks | Excercise (L0898) | Project-/problem-based Learning | 1 | 2 | | |
| Module Responsible | Prof. Andreas Timm-Giel | | | | | |
| Admission Requirements | None | | | | | |
| Recommended Previous Knowledge | Fundamental stochastics Basic understanding of computer networks and/or communication technologies is beneficial | | | | | |
| Educational Objectives | After taking part successfully, students have reached the following learning results | | | | | |
| Professional Competence | | | | | | |
| Knowledge | Students are able to describe the principles and structures of communication networks in detail. They can explain the formal description methods of communication networks and their protocols. They are able to explain how current and complex communication networks work and describe the current research in these examples. | | | | | |
| Skills | Students are able to evaluate the performance of communication networks using the learned methods. They are able to work out problems themselves and apply the learned methods. They can apply what they have learned autonomously on further and new communication networks. | | | | | |
| Personal | | | | | | |
| Competence | | | | | | |
| Social Competence | Students are able to define tasks themselves in small teams and solve these problems together using the learned methods. They can present the obtained results. They are able to discuss and critically analyse the solutions. | | | | | |
| Autonomy | Students are able to obtain the necessary expert knowledge for understanding the functionality and performance capabilities of new communication networks independently. | | | | | |
| Workload in Hours | Independent Study Time 110, Study Time in Lecture 70 | | | | | |
| Credit points | 6 | | | | | |
| Studienleistung | None | | | | | |
| Examination | Presentation | | | | | |
| | | | | | | |

Examination duration 1.5 hours colloquium with three students, therefore about 30 min per student. Topics of the **and scale** colloquium are the posters from the previous poster session and the topics of the module.

| Recommended Previous Knowledge | Lecture "Signals and Systems" Lecture "Fundamentals of Telecommunications and Stochastic Processes" Lecture "Digital Communications" | | | | | |
| Educational Objectives | After taking na | After taking part successfully, students have reached the following learning results | | | | |
| Professional Competence | | | | | | |
| Knowledge | Students are able to explain the general as well as advanced principles and techniques that are applied to wireless communications. They understand the properties of wireless channels and the corresponding mathematical description. Furthermore, students are able to explain the physical layer of wireless transmission systems. In this context, they are proficient in the concepts of multicarrier transmission (OFDM), modulation, error control coding, channel estimation and multi-antenna techniques (MIMO). Students can also explain methods of multiple access. On the example of contemporary communication systems (UMTS, LTE) they can put the learnt content into a larger context. | | | | | |
| Skills | Using the acquired knowledge, students are able to understand the design of current and future wireless systems. Moreover, given certain constraints, they can choose appropriate parameter settings of communication systems. Students are also able to assess the suitability of technical concepts for a given application. | | | | | |
| Personal Competence | | | | | | |
| Social Competence | Students can jointly elaborate tasks in small groups and present their results in an adequa fashion. | | | | | |
| Autonomy | Students are able to extract necessary information from given literature sources and put it into the perspective of the lecture. They can continuously check their level of expertise with the help of accompanying measures (such as online tests, clicker questions, exercise tasks) and based on that, to steer their learning process accordingly. They can relate their acquired knowledge to topics of other lectures, e.g., "Fundamentals of Communications and Stochastic Processes" and "Digital Communications". | | | | | |

| Content | The lecture deals with technical principles and related concepts of mobile communications. In this context, the main focus is put on the physical and data link layer of the ISO-OSI stack. In the lecture, the transmission medium, i.e., the mobile radio channel, serves as the starting point of all considerations. The characteristics and the mathematical descriptions of the radio channel are discussed in detail. Subsequently, various physical layer aspects of wireless transmission are covered, such as channel coding, modulation/demodulation, channel estimation, synchronization, and equalization. Moreover, the different uses of multiple antennas at the transmitter and receiver, known as MIMO techniques, are described. Besides these physical layer topics, concepts of multiple access schemes in a cellular network are outlined. In order to illustrate the above-mentioned technical solutions, the lecture will also provide a system view, highlighting the basics of some contemporary wireless systems, including UMTS/HSPA, LTE, LTE Advanced, and WiMAX. | | | |

| Educational Objectives | After taking nart succ | essfully, students h | ave reached the following le | arning resu | lts |
| Professional Competence | | | | | |
| Knowledge | The students know and understand basic algorithms of digital signal processing. They are familiar with the spectral transforms of discrete-time signals and are able to describe and analyse signals and systems in time and image domain. They know basic structures of digital filters and can identify and assess important properties including stability. They are aware of the effects caused by quantization of filter coefficients and signals. They are familiar with the basics of adaptive filters. They can perform traditional and parametric methods of spectrum estimation, also taking a limited observation window into account. | | | | |
| Skills | The students are able to apply methods of digital signal processing to new problems. The can choose and parameterize suitable filter striuctures. In particular, the can design adaptiv filters according to the minimum mean squared error (MMSE) criterion and develop a efficient implementation, e.g. based on the LMS or RLS algorithm. Furthermore, the student are able to apply methods of spectrum estimation and to take the effects of a limite observation window into account. | | | | |
| Personal Competence | | | | | |
| Social Competence | The students can joi | ntly solve specific pr | oblems. | | |
| Autonomy | The students are able to acquire relevant information from appropriate literature sources. They can control their level of knowledge during the lecture period by solving tutorial problems software tools, clicker system. | | | | |

| Professional Competence | | | | _ | |
| Knowledge | This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for general- purpose computers and for special-purpose machines (e.g., signal processors). Next, foundational aspects of the micro-architecture of processors are covered. Here, the focus particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies. | | | | |
| Skills | The students are able to describe the organization of processors. They know the differen architectural principles and programming models. The students examine various structures o pipelined processor architectures and are able to explain their concepts and to analyze them w.r.t. criteria like, e.g., performance or energy efficiency. They evaluate different structures o memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism. | | | | |
| Personal | | | | | |
| Competence | | | | | |
| Social Competence | Students are able to solve similar problems alone or in a group and to present the results accordingly. | | | | |
| Autonomy | Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes. | | | | |

| Content | The PrBL course part will be performed in small groups of students. Topics are from the field of wireless sensor networks and are loosely related to the lecture contents. Project descriptions and goals are provided but have to be solved by the students as follow: Group meeting, creation of working plan and milestones kick-off presentation (during lecture) free working poster creation and presentation Throughout the semester, there will be meetings with the supervisor on a regular basis (weekly or biweekly). Details about the topics and course organization will be provided in the first lecture. Please note that the number of participants is limited due to the available capacity (rooms, equipment, supervisors). |
| Literature | Will be provided individually |

| Professional Competence | | | | | |
| | This module provides in-depth, hands-on experience on advanced concepts of comput architecture. Using the Hardware Description Language VHDL and using reconfigurab FPGA hardware boards, students learn how to design complex computer systems (so-calle systems-on-chip, SoCs), that are commonly found in the domain of embedded systems, actual hardware. | | | | |
| Knowledge | <i>Ige</i> Starting with a simple processor architecture, the students learn to how realize is processing of a computer processor according to the principle of pipelining. They different styles of cache-based memory hierarchies, examine strategies for scheduling of machine instructions and for branch prediction, and finally construct MPSoC system (multi-processor system-on-chip) that consists of multiple processor are connected via a shared bus. | | | ney impleme for dynan ruct a compl | |
| Skills | Students will be able to analyze, how highly specific and individual computer systems can be constructed using a library of given standard components. They evaluate the interference between the physical structure of a computer system and the software executed thereon. The way, they will be enabled to estimate the effects of design decision at the hardware level of the performance of the entire system, to evaluate the whole and complex system and propose design options to improve a system. | | | | |
| Personal | | | | | |
| Competence Social Competence | Students are able to solve similar problems alone or in a group and to present the resul | | | | |
| Autonomy | Students are able to acquire new knowledge from specific literature, to transform thi | | | | |

Specialization Microelectronics Complements

Students of the specialization Microelectronics Complements expand their knowledge towards the application of microelectronics and microsystems for medical use, the processing of digital signals, the development and design of highly complex integrated systems and networks for optical communication. Thus, they strengthen their knowledge by analyzing practical applications and link it up with the requirements of technical realizations.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

Module M0921: Electronic Circuits for Medical Applications Courses Title Тур Hrs/wk CP Electronic Circuits for Medical Applications (L0696) Lecture 3 2 Electronic Circuits for Medical Applications (L1056) Recitation Section (small) 1 2 Electronic Circuits for Medical Applications (L1408) Practical Course 1 1 Module Responsible Prof. Matthias Kuhl Admission None Requirements Recommended Fundamentals of electrical engineering **Previous Knowledge** Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence Students can explain the basic functionality of the information transfer by the central nervous system Students are able to explain the build-up of an action potential and its propagation along an axon Students can exemplify the communication between neurons and electronic devices Students can describe the special features of low-noise amplifiers for medical Knowledge applications Students can explain the functions of prostheses, e.g. an artificial hand Students are able to discuss the potential and limitations of cochlea implants and artificial eyes • Students can calculate the time dependent voltage behavior of an action potential Students can give scenarios for further improvement of low-noise and low-power signal acquisition. Skills Students can develop the block diagrams of prosthetic systems • Students can define the building blocks of electronic systems for an articifial eye. Personal Competence Students are trained to solve problems in the field of medical electronics in teams together with experts with different professional background. Students are able to recognize their specific limitations, so that they can ask for assistance to the right time. Social Competence Students can document their work in a clear manner and communicate their results in

| | a way that others can be involved whenever it is necessary | | | | |
|---|--|--|--|--|--|
| Autonomy | Students are able to realistically judge the status of their knowledge and to define actions for improvements when necessary. Students can break down their work in appropriate work packages and schedule their work in a realistic way. Students can handle the complex data structures of bioelectrical experiments without needing support. Students are able to act in a responsible manner in all cases and situations of experimental work. | | | | |

| Professional Competence | | | |
| Knowledge | Students are able to explain the fundamental principles, inter-dependencies, and methods of Electromagnetic Compatibility of electric and electronic systems and to ensure Electromagnetic Compatibility of such systems. They are able to classify and explain the common interference sources and coupling mechanisms. They are capable of explaining the basic principles of shielding and filtering. They are able of giving an overview over measurement and simulation methods for the characterization of Electromagnetic Compatibility in electrical engineering practice. | | |
| Skills | Students are able to apply a series of modeling methods for the Electromagnetic Compatibility of typical electric and electronic systems. They are able to determine the most important effects that these models are predicting in terms of Electromagnetic Compatibility. They can classify these effects and they can quantitatively analyze them. They are capable of deriving problem solving strategies from these predictions and they can adapt them to applications in electrical engineering practice. They can evaluate their problem solving strategies against each other. | | |
| Personal | | | |
| Competence | Studente are able to wark together | on subject related tasks in small | aroupe They are able to |
| Social Competence | Students are able to work together present their results effectively in Er | | |
| Autonomy | Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to make a connection between their knowledge obtained in this lecture with the content of other lectures (e.g. Theoretical Electrical Engineering and Communication Theory). They can communicate problems and solutions in the field of Electromagnetic Compatibility in english language. | | |

Module M0781: EMC II: Signal Integrity and Power Supply of Electronic Systems

| Courses | | | |
|---|----------------------------|--------|----|
| Title | Тур | Hrs/wk | СР |
| EMC II: Signal Integrity and Power Supply of Electronic Systems (L0770) | Lecture | 3 | 4 |
| EMC II: Signal Integrity and Power Supply of Electronic Systems (L0771) | Recitation Section (small) | 1 | 1 |
| EMC II: Signal Integrity and Power Supply of Electronic Systems (L0774) | Practical Course | 1 | 1 |

| | Prof. Christian Schuster |
|-----------------------------------|---|
| Admission Requirements | None |
| Recommended Previous Knowledge | |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Students are able to explain the fundamental principles, inter-dependencies, and methods of signal and power integrity of electronic systems. They are able to relate signal and power integrity to the context of interference-free design of such systems, i.e. their electromagnetic compatibility. They are capable of explaining the basic behavior of signals and power supply in typical packages and interconnects. They are able to propose and describe problem solving strategies for signal and power integrity issues. They are capable of giving an overview over measurement and simulation methods for characterization of signal and power integrity in electrical engineering practice. |
| Skills | Students are able to apply a series of modeling methods for characterization of electromagnetic field behavior in packages and interconnect structure of electronic systems. They are able to determine the most important effects that these models are predicting in terms of signal and power integrity. They can classify these effects and they can quantitatively analyze them. They are capable of deriving problem solving strategies from these predictions and they can adapt them to applications in electrical engineering practice. The can evaluate their problem solving strategies against each other. |
| Personal Competence | |
| Social Competence | |
| Autonomy | Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to make a connection between their knowledge obtained in this lecture with the content of other lectures (e.g. theory of electromagnetic fields, communications, and semiconductor circuit design). They can communicate problems and solutions in the field of signal integrity and power supply of interconnect and packages in English. |

Thesis

| Module M-002: M | laster Thesis |
|-----------------------------------|---|
| Courses | |
| Title | Typ Hrs/wk CP |
| Module Responsible | Professoren der TUHH |
| Admission Requirements | |
| Recommended Previous Knowledge | |
| Educational Objectives | Atter taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | The students can use specialized knowledge (facts, theories, and methods) of the subject competently on specialized issues. The students can explain in depth the relevant approaches and terminologies in on or more areas of their subject, describing current developments and taking up a critical position on them. The students can place a research task in their subject area in its context and describ and critically assess the state of research. |
| Skills | The students are able: To select, apply and, if necessary, develop further methods that are suitable for solvin the specialized problem in question. To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incompletely defined problems in a solution-oriente way. To develop new scientific findings in their subject area and subject them to a critical assessment. |
| Personal Competence | |
| Social Competence | Students can Both in writing and orally outline a scientific issue for an expert audience accurately understandably and in a structured way. Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholding their own assessments an viewpoints convincingly. |
| Autonomy | Students are able: To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. |

| | • To apply the techniques of scientific work comprehensively in research of their own. |
