Program description

Content

Microelectronics, or better named nanoelectronics, because the minimum structure size of state-of-the-art integrated electronic circuits are in the range of 20 nm and below, is the base of the products that significantly influence the daily life of people almost anywhere on earth. Examples are personal computers and smartphones. Both of them open up new possibilities of communication and give access to almost unlimited sources of information, especially when those devices are connected to the world wide web. Another example are medical diagnostic tools for computer tomography or nuclear resonance tomography or intelligent medical implants as all these systems are based on the high computational performance and high data communication efficiency provided by advanced nanoelectronics.

The fundament for microelectronics and microsystems is semiconductor physics and technology. Thus, the objective of the International Master Program "Microelectronics and Microsystems" is to give the students a profound knowledge on physical level about electronic effects in semiconductor materials, especially silicon, and on the functionality of electronic devices. Furthermore, the students are taught about process technology for fabrication of integrated circuits and microsystems. This will enable the students to understand in depth the function of advanced electronic devices and fabrication processes. They will be able to comprehend in a critical way the problems accompanied with the transition to smaller minimum structure sizes. Thus, the students can conceive which possible solutions may exist or could be developed to overcome the problems of scaling-down the device minimum feature size. This will enable the students to understand the ongoing scaling-down of MOS transistors with its potential but also with its limitations.

Besides the essential role of physical basics the precise knowledge of process dependent manufacturing procedures are of key importance for training of the students in the field of nanoelectronics and microsystems. This will help them to develop during their professional life the ability to generate innovative concepts and bring them to practical applications.

The International Master Program "Microelectronics and Microsystems" qualifies the students for scientific professional work in the fields of electrical engineering and information technology. This professional work may extend from the development, production and application to the quality control of complex systems with highly integrated circuits and microsystems components. Both fields are coming closer and closer together, as a fast rising number of complex applications requires the integration of nanoelectronics and microsystems to one combined system.

In particular, this program enables the students not only to design new complex systems for innovative applications, but also to make them usable for practical applications. This can be realized by teaching the students engineering methods both on a physical and theoretical level and on an application oriented level.

Career prospects

The graduates of the International Master Program "Microelectronics and Microsystems" can find a wide variety of professional options as they have well founded knowledge about technology, design and application of highly integrated systems based on nanoelectronics and microsystems.

Thus, one group of possible employers are large companies with international sites for the production of integrated circuits, but also small or medium-sized companies for microsystems. Many job opportunities also exist in the field of development and design of integrated circuits and of microsystems. Because of the fast decline in prices of high-performance computer system, even small companies can conduct tasks that require many computational efforts such as the design of integrated circuits that, then, are fabricated by specialized companies, so-called silicon foundries. This allows many small companies to participate in the market for integrated circuits, so that they can contribute to a good job market for engineers in nanoelectronics and microsystems.

Learning target

Knowledge

- The students understand the basic physical principles of microelectronic devices and functional block of microsystems. Furthermore, they have solid knowledge regarding fabrication technologies, so that they can explain them in detail.
- They have gained solid knowledge in selected fields based on a broad theoretical and methodical fundament.
- The students possess in-depth knowledge of interdisciplinary relationships.
- They have the required background knowledge in order to position their professional subjects by appropriate means in the scientific and social environment.

Skills

The students are able

- to apply computational methods for quantitative analysis of design parameters and for development of innovative systems for microelectronics and microsystems.
- to solve complex problems and tasks in a self-dependent manner by basic methodical approaches that may be, if necessary, beyond the standard patterns
- to consider technological progress and scientific advancements by taking into account the technical, financial and ecological boundary conditions.

Social Skills

The students are capable of

- working in interdisciplinary teams and organizing their tasks in a process oriented manner to become prepared for conducting research based professional work and for taking management responsibilities.
- to present their results in a written or oral form effectively targeting the audience, on international stage also.

Autonomy

- The students can pervade in an effectively and self-dependently organized way special areas of their professional fields using scientific methods.
- They are able to present their knowledge by appropriate media techniques or to describe it by documents with reasonable lengths.
- The students are able to identify the need for additional information and to develop a strategy for self-dependent enhancement of their knowledge.

Program structure

The curriculum of the International Master Program "Microelectronics and Microsystems" is structured as follows:

Module Manual M.Sc. "Microelectronics and Microsystems"

- Core Qualification:
- Main subject: The students choose one main subject out of the following two options:

The students have to take for their main subjects moduls totaling 18 CPs (1. - 3. semester).

• Master thesis with 30 CP (4. semester)

The sum of required credit points of this Master program is 120 CP.

Core qualification

| Module M0523: Busin | ess & Management |
|-------------------------|---|
| Module Responsible | Prof. Matthias Meyer |
| Admission Requirements | None |
| Recommended Previous | None |
| Knowledge | |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Students are able to find their way around selected special areas of management within the scope of business managemen Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge. |
| Skills | Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management. |
| Personal Competence | |
| Social Competence | |
| Autonomy | Students are capable of acquiring necessary knowledge independently by means of research and preparation of material. |
| Workload in Hours | Depends on choice of courses |
| Credit points | 6 |

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module M0524: Non-technical Courses for Master

| Produce responsible Baginar raci | Module Responsible | Dagmar | Rich |
|----------------------------------|--------------------|--------|------|
|----------------------------------|--------------------|--------|------|

Admission Requirements None

Knowledge

Recommended Previous None

Educational Objectives After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge The Nontechnical Academic Programms (NTA)

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- · explain specialized areas in context of the relevant non-technical disciplines,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area.
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- · apply basic and specific methods of the said scientific disciplines,
- · aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- · to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

| Personal Competence | |
|---------------------|--|
| · | Personal Competences (Social Skills) |
| | to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge. |
| Autonomy | Personal Competences (Self-reliance) |
| | Students are able in selected areas |
| | to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) |
| | Depends on choice of courses |
| Credit points | 6 |

Module M1137: Technical Elective Complementary Course for IMPMM - field ET (according to Subject Specific Regulations)

| Courses | | | | | |
|--|--|--|--|--|--|
| Title | Typ Hrs/wk CP | | | | |
| Module Responsible | Prof. Hoc Khiem Trieu | | | | |
| Admission Requirements | None | | | | |
| Recommended Previous | Basic knowledge in electrical enginnering, physics, semiconductor devices and mathematics at Bachelor of Science level | | | | |
| Knowledge | | | | | |
| Educational Objectives | After taking part successfully, students have reached the following learning results | | | | |
| Professional Competence | | | | | |
| Knowledge | As this modul can be chosen from the modul catalogue of the department E, the competence to be acquired is acccording to t chosen subject. | | | | |
| Skills | As this modul can be chosen from the modul catalogue of the department E, the skills to be acquired is acccording to the choser subject. | | | | |
| Personal Competence | | | | | |
| Social Competence | | | | | |
| | Students can team up with one or several partners who may have different professional backgrounds Students are able to work by their own or in small groups for solving problems and answer scientific questions. | | | | |
| Autonomy | | | | | |
| | Students are able to assess their knowledge in a realistic manner. The students are able to draw scenarios for estimation of the impact of advanced mobile electronics on the future lifestyle the society. | | | | |
| Workload in Hours | Depends on choice of courses | | | | |
| Credit points | 6 | | | | |
| Assignment for the Following Curricula | Microelectronics and Microsystems: Core qualification: Elective Compulsory | | | | |

| Module M0930: Semio | conductor Seminar | | | | |

| Recommended Previous | Semiconductors | | | | |
| Knowledge | | | | | |
| Educational Objectives | After taking part successfully, students have | reached the following learning results | | | |
| Professional Competence | | | | | |
| Knowledge | Students can explain the most important fact | ts and relationships of a specific topic from | the field of semicondu | ctors. | |
| Skills | Students are able to compile a specified topi | | | | |
| | | presentation of the subject. They can comply with a given duration of the presentation. They can write in English a summary | | | |
| | including illustrations that contains the most | important results, relationships and explai | nations of the subject. | | |
| Personal Competence | | | | | |
| Social Competence | Students are able to adapt their presentation | with respect to content, detailedness, an | d presentation style to | the composition and | |
| | previous knowledge of the audience. They ca | n answer questions from the audience in a | a curt and precise manr | ner. | |
| Autonomy | Students are able to autonomously carry out | a literature research concerning a given | topic. They can indepe | ndently evaluate the | |
| | material. They can self-reliantly decide which | parts of the material should be included i | n the presentation. | | |
| Workload in Hours | Independent Study Time 32, Study Time in L | ecture 28 | | | |

| Content | Prepare, present, and discuss talks about recent topics from the field of semiconductors. The presentations must be given in English. |
| | • understanding of subject, discussion, response to questions • structure and logic of presentation (clarity, precision) • coverage of the topic, selection of subjects presented • linguistic presentation (clarity, comprehensibility) • visual presentation (clarity, comprehensibility) • handout (see below) • compliance with timing requirement. |
| | Handout: Before your presentation, it is mandatory to distribute a printed handout (short abstract) of your presentation in English language. This must be no longer than two pages A4, and include the most important results, conclusions, explanations and diagrams. |

| Knowledge | | | | | |
| | After taking part successfully, students have reached the following learning results | | | | |
| Professional Competence | | | | | |
| Knowledge | Students can explain the structure and philosophy of the software framework for circuit design. Students can determine all necessary input parameters for circuit simulation. Students know the basics physics of the analog behavior. Students can explain the algorithms of circuit verification. Students are able to select the appropriate transistor models for fast and accurate simulations. | | | | |
| Skills | Students can activate and execute all necessary checking routines for verification of proper circuit functionality. Students can define the specifications of the electronic circuits to be designed. Students can optimize the electronic circuits for low-noise and low-power. Students can develop analog circuits for specific applications. | | | | |
| Personal Competence Social Competence | Students are trained to work through complex circuits in teams. Students are able to share their knowledge for efficient design work. Students can help each other to understand all the details and options of the design software. Students are aware of their limitations regarding circuit design, so they do not go ahead, but they involve experts who required. Students can present their design approaches for easy checking by more experienced experts. | | | | |
| Autonomy | Students are able to realistically judge the status of their knowledge and to define actions for improvements who necessary. Students can break down their design work in sub-tasks and can schedule the design work in a realistic way. Students can handle the complex data structures of their design task and document it in consice but understandable way. Students are able to judge the amount of work for a major design project. | | | | |

Module M1131: Technical Elective Complementary Course for IMPMM - field TUHH (according to Subject Specific Regulations)

| Courses | |
|--------------------------------|---|
| Title | Typ Hrs/wk CP |
| Module Responsible | Prof. Hoc Khiem Trieu |
| Admission Requirements | None |
| Recommended Previous | |
| Knowledge | Basic knowledge in electrical enginnering, physics, semiconductor devices, software and mathematics at Bachelor of Science level |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | |
| | As this module can be chosen from the module catalogue of the TUHH, the competence to be acquired is according to the choser |
| | subject. |
| Skills | |
| | |
| | As this module can be chosen from the module catalogue of the TUHH, the skills to be acquired is according to the chosen subject. |
| | |
| Personal Competence | |
| Social Competence | |
| | Students can team up with one or several partners who may have different professional backgrounds |
| | Students are able to work by their own or in small groups for solving problems and answer scientific questions. |
| Autonomy | |
| | Depends on choice of courses |
| Credit points | 6 |
| Assignment for the | Microelectronics and Microsystems: Core qualification: Elective Compulsory |
| | Microelectronics and Microsystems: Core qualification: Elective Compulsory |

Specialization Communication and Signal Processing

Students of the specialization Communication and Signal Processing learn both physical and technical basics of state-of-the-art wired and wireless communication systems and the hardware realization of those systems. They can deepen their knowledge towards core areas such as systems for audio or video signal processing. The students understand the fundamental concepts of those systems and can identify their limitations. Based on this knowledge they are able to determine possible improvements and to implement them.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

| Content | The lecture deals with technical principles and related concepts of mobile communications. In this context, the main focus is put on the physical and data link layer of the ISO-OSI stack. |
| | In the lecture, the transmission medium, i.e., the mobile radio channel, serves as the starting point of all considerations. The characteristics and the mathematical descriptions of the radio channel are discussed in detail. Subsequently, various physical layer aspects of wireless transmission are covered, such as channel coding, modulation/demodulation, channel estimation, synchronization, and equalization. Moreover, the different uses of multiple antennas at the transmitter and receiver, known as MIMO techniques, are described. Besides these physical layer topics, concepts of multiple access schemes in a cellular network are outlined. In order to illustrate the above-mentioned technical solutions, the lecture will also provide a system view, highlighting the basics of some contemporary wireless systems, including UMTS/HSPA, LTE, LTE Advanced, and WiMAX. |

|---|---|---------------------------------------|--------|-------------|
| Courses | | | | |
| Title Digital Audio Signal Processing (L0650) | | Typ Lecture | Hrs/wk | CP 4 |
| Digital Audio Signal Processing (L06 | | Recitation Section (large) | 1 | 2 |
| Module Responsible | Prof. Udo Zölzer | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Signals and Systems | | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have re | eached the following learning results | | |
| | Die Studierenden können die grundlegenden Verfahren und Methoden der digitalen Audiosignalverarbeitung erklären. Sie können die wesentlichen physikalischen Effekte bei der Sprach- und Audiosignalverarbeitung erläutern und in Kategorien einordnen. Sie können einen Überblick der numerischen Methoden und messtechnischen Charakterisierung von Algorithmen zur Audiosignalverarbeitung geben. Sie können die erarbeiteten Algorithmen auf weitere Anwendungen im Bereich der Informationstechnik und Informatik abstrahieren. | | | |
| | The students will be able to apply methods and techniques from audio signal processing in the fields of mobile and internet communication. They can rely on elementary algorithms of audio signal processing in form of Matlab code and interactive JAVA applets. They can study parameter modifications and evaluate the influence on human perception and technical applications in a variety of applications beyond audio signal processing. Students can perform measurements in time and frequency domain in order to give objective and subjective quality measures with respect to the methods and applications. | | | |
| Personal Competence | | | | |
| · | The students can work in small groups to study special tasks and problems and will be enforced to present their results with adequate methods during the exercise. | | | |
| | The students will be able to retrieve information out of the relevant literature in the field and putt hem into the context of the lecture. They can relate their gathered knowledge and relate them to other lectures (signals and systems, digital communication systems, image and video processing, and pattern recognition). They will be prepared to understand and communicate problems and effects in the field audio signal processing. | | | |

| Recommended Previous | System theory of one-dimensional signals (convolution and correlation, sampling theory, interpolation and decimation, Four |
| Knowledge | transform, linear time-invariant systems), linear algebra (Eigenvalue decomposition, SVD), basic stochastics and statist |
| | (expectation values, influence of sample size, correlation and covariance, normal distribution and its parameters), basics of Matl |
| | basics in optics |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Students can |
| | |
| | Describe imaging processes |
| | Depict the physics of sensorics Trucking linear and any linear fitting of singular |
| | Explain linear and non-linear filtering of signals Establish interdisciplinary connections in the subject area and arrange them in their context |
| | Interpret effects of the most important classes of imaging sensors and displays using mathematical methods and physi |
| | models. |
| | |
| Skills | Students are able to |
| | |
| | Use highly sophisticated methods and procedures of the subject area |
| | Identify problems and develop and implement creative solutions. |
| | Students can solve simple arithmetical problems relating to the specification and design of image processing and image analy |
| | systems. |
| | Students are able to accord different colution approaches in multidimensional decision making areas |
| | Students are able to assess different solution approaches in multidimensional decision-making areas. |
| | Students can undertake a prototypical analysis of processes in Matlab. |
| | |
| Personal Competence | |
| Social Competence | k.A. |
| | |
| Autonomy | Students can solve image analysis tasks independently using the relevant literature. |

| Recommended Previous | Module "Computer Engineering" | | | | |
| Knowledge | | | | | |
| Educational Objectives | After taking part successfully, st | udents have reached th | ne following learning results | | |
| Professional Competence | | | | | |
| | This module presents advanced concepts from the discipline of computer architecture. In the beginning, a broad overview over various programming models is given, both for general-purpose computers and for special-purpose machines (e.g., signal processors). Next, foundational aspects of the micro-architecture of processors are covered. Here, the focus particularly lies on the so-called pipelining and the methods used for the acceleration of instruction execution used in this context. The students get to know concepts for dynamic scheduling, branch prediction, superscalar execution of machine instructions and for memory hierarchies. | | | | |
| Skills | The students are able to describe the organization of processors. They know the different architectural principles and programming models. The students examine various structures of pipelined processor architectures and are able to explain their concepts and to analyze them w.r.t. criteria like, e.g., performance or energy efficiency. They evaluate different structures of memory hierarchies, know parallel computer architectures and are able to distinguish between instruction- and data-level parallelism. | | | | |
| Personal Competence | | | | | |
| Social Competence | Students are able to solve similar problems alone or in a group and to present the results accordingly. | | | | |
| Autonomy | Students are able to acquire new knowledge from specific literature and to associate this knowledge with other classes. | | | | |

| Content | Description |
| | The term dependability comprises various aspects of a system. These are typically: |
| | ReliabilityAvailabilityMaintainability |
| | Safety Security |
| | This makes dependability a core aspect that has to be considered early in system design, no matter whether software, embedded systems or full scale cyber-physical systems are considered. Contents |
| | The module introduces the basic concepts for the design and the analysis of dependable systems. Design examples for getting practical hands-on-experience in dependable design techniques. The module focuses towards embedded systems. The following topics are covered: |
| | Modelling Fault Tolerance Design Concepts Analysis Techniques |

| Content | The PrBL course part will be performed in small groups of students. Topics are from the field of wireless sensor networks and are loosely related to the lecture contents. Project descriptions and goals are provided but have to be solved by the students as follow: 1. Group meeting, creation of working plan and milestones 2. kick-off presentation (during lecture) 3. free working 4. poster creation and presentation Throughout the semester, there will be meetings with the supervisor on a regular basis (weekly or biweekly). Details about the topics and course organization will be provided in the first lecture. Please note that the number of participants is limited due to the available capacity (rooms, equipment, supervisors). |
| Literature | Will be provided individually |

|----------------------------------|--|
| Courses | |
| Title | Typ Hrs/wk CP |
| Advanced System-on-Chip Design (| L1061) Project-/problem-based Learning 3 6 |
| Module Responsible | Prof. Heiko Falk |
| Admission Requirements | None |
| Recommended Previous | Successful completion of the practical FPGA lab of module "Computer Architecture" is a mandatory prerequisite. |
| Knowledge | |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | This module provides in-depth, hands-on experience on advanced concepts of computer architecture. Using the Hardware Description Language VHDL and using reconfigurable FPGA hardware boards, students learn how to design complex computer systems (so-called systems-on-chip, SoCs), that are commonly found in the domain of embedded systems, in actual hardware. Starting with a simple processor architecture, the students learn to how realize instruction-processing of a computer processor |
| | according to the principle of pipelining. They implement different styles of cache-based memory hierarchies, examine strategies for dynamic scheduling of machine instructions and for branch prediction, and finally construct a complex MPSoC system (multi-processor system-on-chip) that consists of multiple processor cores that are connected via a shared bus. |
| Skills | Students will be able to analyze, how highly specific and individual computer systems can be constructed using a library of given standard components. They evaluate the interferences between the physical structure of a computer system and the software executed thereon. This way, they will be enabled to estimate the effects of design decision at the hardware level on the performance of the entire system, to evaluate the whole and complex system and to propose design options to improve a system. |
| Personal Competence | |
| Social Competence | Students are able to solve similar problems alone or in a group and to present the results accordingly. |
| Autonomy | Students are able to acquire new knowledge from specific literature, to transform this knowledge into actual implementations of complex hardware structures, and to associate this knowledge with contents of other classes. |

Specialization Microelectronics Complements

Students of the specialization Microelectronics Complements expand their knowledge towards the application of microelectronics and microsystems for medical use, the processing of digital signals, the development and design of highly complex integrated systems and networks for optical communication. Thus, they strengthen their knowledge by analyzing practical applications and link it up with the requirements of technical realizations.

Students have to choose lectures with a total of 18 credit points from the catalog of this specialization.

| Module Responsible | Prof. Christian Schust | er | | | | |
| Admission Requirements | None | | | | | |
| Recommended Previous | Fundamentals of Elec | trical Engineering | | | | |
| Knowledge | | | | | | |
| Educational Objectives | After taking part succ | essfully, students hav | ve reached the follow | ing learning results | | |
| Professional Competence | | | | | | |
| Skills | Students are able to explain the fundamental principles, inter-dependencies, and methods of Electromagnetic Compatibility of electric and electronic systems and to ensure Electromagnetic Compatibility of such systems. They are able to classify and explain the common interference sources and coupling mechanisms. They are capable of explaining the basic principles of shielding and filtering. They are able of giving an overview over measurement and simulation methods for the characterization of Electromagnetic Compatibility in electrical engineering practice. Students are able to apply a series of modeling methods for the Electromagnetic Compatibility of typical electric and electronic systems. They are able to determine the most important effects that these models are predicting in terms of Electromagnetic Compatibility. They can classify these effects and they can quantitatively analyze them. They are capable of deriving problem solving strategies from these predictions and they can adapt them to applications in electrical engineering practice. They can evaluate their problem solving strategies against each other. | | | | | |
| Personal Competence | | | | | | |
| Social Competence | Students are able to work together on subject related tasks in small groups. They are able to present their results effectively in English, during laboratory work and exercises, e.g | | | | | |
| Autonomy | Students are capable to gather necessary information from the references provided and relate that information to the context of the lecture. They are able to make a connection between their knowledge obtained in this lecture with the content of other lectures (e.g. Theoretical Electrical Engineering and Communication Theory). They can communicate problems and solutions in the field of Electromagnetic Compatibility in english language. | | | | | |

| Admission Requirements | | | |
| | According to General Regulations §21 (1): | | |
| | At least 60 credit points have to be achieved in study programme. The examinations b | oard decides on e | exceptions. |
| | | | |
| Recommended Previous | | | |
| Knowledge | | | |
| | After taking part successfully, students have reached the following learning results | | |
| Professional Competence | | | |
| Knowledge | The students can use specialized knowledge (facts, theories, and methods) of their | r subject compe | ently on specialized |
| | issues. | , | |
| | The students can explain in depth the relevant approaches and terminologies in | one or more are | eas of their subject, |
| | describing current developments and taking up a critical position on them. | | |
| | The students can place a research task in their subject area in its context and desc | ribe and critically | assess the state of |
| | research. | | |
| | | | |
| | | | |
| Skills | The students are able: | | |
| | To the desired for the state of | | |
| | To select, apply and, if necessary, develop further methods that are suitable for solving | | |
| | To apply knowledge they have acquired and methods they have learnt in the cours in apply knowledge they have acquired and methods they have learnt in the cours | se of their studie | s to complex and/or |
| | incompletely defined problems in a solution-oriented way. | -cocomont | |
| | To develop new scientific findings in their subject area and subject them to a critical as | ssessment. | |
| Personal Competence | | | |
| Social Competence | Students can | | |
| | | | |
| | Both in writing and orally outline a scientific issue for an expert audience accurately | , understandably | and in a structured |
| | way. | *b-+ ii- | |
| | Deal with issues competently in an expert discussion and answer them in a manner while unhelding their own assessments and viewpoints convincingly. | тпат із арргоріта | te to the addressees |
| | while upholding their own assessments and viewpoints convincingly. | | |
| | | | |
| Autonomy | Students are able | | |
| Autonomy | Students are able: | | |
| | To structure a project of their own in work packages and to work them off accordingly. | | |
| | To work their way in depth into a largely unknown subject and to access the informatic | on required for the | em to do so. |
| | To apply the techniques of scientific work comprehensively in research of their own. | | |

| | | | |
| Examination | Thesis | | |
| Examination duration and | According to General Regulations | | |
| scale | Civil Facing signs. Thesis, Commuters | | |
| | Civil Engineering: Thesis: Compulsory | | |
| Following Curricula | | | |
| | Chemical and Bioprocess Engineering: Thesis: Compulsory Computer Science: Thesis: Compulsory | | |
| | Electrical Engineering: Thesis: Compulsory | | |
| | Energy and Environmental Engineering: Thesis: Compulsory | | |
| | Energy Systems: Thesis: Compulsory | | |
| | Environmental Engineering: Thesis: Compulsory | | |
| | | | |
| | Aircraft Systems Engineering: Thesis: Compulsory | | |
| | Global Innovation Management: Thesis: Compulsory | | |
| | Global Innovation Management: Thesis: Compulsory | | |
| | | | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory | | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory | у | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Management and Engineering: Thesis: Compulsory | у | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Management and Engineering: Thesis: Compulsory Joint European Master in Environmental Studies - Cities and Sustainability: Thesis: Compulsor | у | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Management and Engineering: Thesis: Compulsory Joint European Master in Environmental Studies - Cities and Sustainability: Thesis: Compulsor Logistics, Infrastructure and Mobility: Thesis: Compulsory | у | |
| | Global Innovation Management: Thesis: Compulsory Computational Science and Engineering: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Management and Engineering: Thesis: Compulsory Joint European Master in Environmental Studies - Cities and Sustainability: Thesis: Compulsor Logistics, Infrastructure and Mobility: Thesis: Compulsory Materials Science: Thesis: Compulsory | у | |

Module Manual M.Sc. "Microelectronics and Microsystems"

| Microsystems" | |
|---------------|---|
| | Mechatronics: Thesis: Compulsory |
| | Biomedical Engineering: Thesis: Compulsory |
| | Microelectronics and Microsystems: Thesis: Compulsory |
| | Product Development, Materials and Production: Thesis: Compulsory |
| | Renewable Energies: Thesis: Compulsory |
| | Naval Architecture and Ocean Engineering: Thesis: Compulsory |
| | Ship and Offshore Technology: Thesis: Compulsory |
| | Teilstudiengang Lehramt Metalltechnik: Thesis: Compulsory |
| | Theoretical Mechanical Engineering: Thesis: Compulsory |
| | Process Engineering: Thesis: Compulsory |
| | Water and Environmental Engineering: Thesis: Compulsory |
| | Certification in Engineering & Advisory in Aviation: Thesis: Compulsory |
