Bachelor

Energy and Environmental Engineering

Cohort: Winter Term 2018

Updated: 28th September 2018

Program description

Content

One of the main challenges in modern society is the reliable, environmentally benign and sustainable supply of energy. An efficient energy supply is moreover essential to secure the economic future of the country.

The exponential increase in world population, the raised living standards and the continuously increasing hunger for feedstocks, acreage and energy make the sustainable handling of natural resources imperative. This includes the reduction of emissions and the minimization of environmental impact. An example with growing significance is the control of the CO_2 emissions that are responsible for the greenhouse effect. For this, possibilities are sought after that bring energy savings or involve increased use of renewable energy sources. In a continued utilization of fossil fuels the reduction of CO_2 emissions is pursued by increasing efficiency and also through separation and underground storage of the CO_2 emitted. The latter approaches make a close cooperation between Energy Engineering and Environmental Engineering unavoidable.

The consecutive degree in Energy and Environmental Engineering had been started already in the beginning of the century in the form of a corresponding Diploma course. The motivation for this development was on the one hand the increasing significance of environmental protection through CO_2 separation in large power stations and, on the other, the growing supply of electricity from regenerative energy sources. Both these key developments in electricity generation are taken into consideration in designing the Bachelor course. Not only for the CO_2 separation technologies but also for other environmental protection purposes, as for example air pollution protection, a wide spectrum of chemistry lectures is incorporated and this contrasts markedly the classical power station engineering curriculum. Renewable electricity generation is covered in the Bachelor degree from a generalist viewpoint only. First in the Master degree of Energy and Environmental Engineering special renewable energy topics are included, to expand the conventional energy systems engineering curriculum. At Master level and in addition to the above mentioned air pollution prevention, also the environmental protection of water and soils are covered.

The Bachelor of Energy and Environmental Engineering conveys a wide and well-founded multidisciplinary fundamental knowledge in the disciplines of Energy Engineering and of Environmental Engineering. This includes a well-grounded understanding over the basic methods of engineering (mathematics, mechanics, thermodynamics, fluid mechanics, chemistry, process engineering, materials engineering and engineering construction). Moreover, basic skills in environmental assessment and environmental technology and particle technology, along with non-technical subjects, are conveyed. These provide necessary qualifications for elaborating the supporting processes during system development. At the skills level the Bachelor degree prepares the student for a Master study or even a PhD research, too, so that after graduation also professional qualifications suitable for a potential future research career are gained.

Career prospects

The operating conditions of the energy market and the environmental protection are subjected to increasingly accelerating changes. To account for this in the degree study, special attention is given to convey future-proof knowledge. This enables the students to be easily adaptable to market changes, so that also in future developments they can react autonomously, adapt successfully to their desired placement targets and extend their professional horizons independently. Towards this aim the Bachelor of Energy and Environmental Engineering covers a wide scientific and methodological basis curriculum.

The graduates, after completion of the study program, possess a wide spectrum of fundamental knowledge in the subject areas of energy systems and environmental engineering. They are thus in a position to articulate the fundamental principles of modelling and simulating energy conversion systems encompassing energy, mass and momentum transport processes, while they pay particular attention to sustainability. The graduates are able to analyze energy processes, evaluate the energetically and economically optimal operation of energy systems, draw balances of energy plants and comprehend the technical and economic interplay between conventional and renewable energy technologies. The graduates are in a position to describe the construction, operation and organization of power plants and to explain the constructive characteristics of energy systems and their components. They can also master the automatic control measures used. They can identify the environmental impact in general and develop specific strategies for mitigating the various environmental risks emanating from industrial plant. The students obtain practice in critically studying a problem of their discipline, classify it within their subject area and orally elaborate suitable solution procedures.

The graduates are in a position to undertake responsibly engineering tasks in various activity fields within energy and environmental engineering and carry them out competently. They are allowed to use the

professional title "Ingenieur/Ingenieurin" in accordance with the legal framework (IngG) of the German Federal Lands. They furthermore acquire the necessary scientific knowledge for a subsequent, deeper Master study.

Continuous interaction with Industry within the framework of joint research or through further contact opportunities enables to closely follow the increasingly accelerating changes in qualification profiling demanded by the market. This facilitates the continuous adjustment of the curricular contents of the Bachelor of Energy and Environmental Engineering to the prevailing market conditions.

Learning target

The Bachelor of Energy and Environmental Engineering endeavors to give to the graduate not only a professional qualification but also prepare the student for a consecutive Master study program. The essential basic methodological skills to do this are conveyed through a combination of basic and advanced learning modules from Mechanical Engineering, Process Engineering and Environmental Engineering.

Through contributions in the lectures by professional engineers from industry, by using software tools established in the praxis for performing simplified tutorials or by means of on-site visits, the students are able to acquire during their study a realistic overview of the multifaceted professional field of Energy and Environmental Engineering. This strengthens the future career chances of the graduates substantially. The possibility to perform external Bachelor thesis work offers an additional exposure to real professional practice.

The graduates can undertake engineering tasks in various fields of activity in energy and environmental engineering and complete them responsibly and competently. In addition, they acquire the necessary scientific skills for a subsequent more focused Master study.

Knowledge

The background knowledge acquired during the Bachelor study program enables the graduate to understand phenomena incurring in Energy Systems, Environmental Engineering or neighboring disciplines. The graduates learn the basic principles of energy and environmental technology for modelling and simulating the energy conversion and the energy, matter and momentum transfer processes involved, while taking also into account sustainability and environmental protection. Their knowledge consists of facts, basic methods and theories, which are conveyed during the Bachelor of Energy and Environmental Engineering in the following manner:

- The graduates are able to articulate their basic knowledge in subject areas of the natural and engineering sciences such as mathematics, chemistry, mechanics, thermodynamics, fluid mechanics, informatics, materials science, electrical engineering and construction engineering.
- The graduates can utilize basic methods and solution approaches for iterative decision making and optimization of problems, such as differentiation, gradient based approaches or hypothesis testing. They can also analyze and evaluate the above methods as regards complexity, convergence and merit.
- Through further specialized knowledge in the subject areas (Process Engineering, Energy Systems and Environmental Technology) the graduates can describe and compare different layouts of energy processes. This applies to both conventional and renewable energy plants. They can also evaluate the environmental impact from these energy facilities.
- The graduates can describe the structure, operation and organization of conventional and regenerative energy plants and their components. This includes also the automatic control systems used therein. They are competent to identify the facets for an energetically and economically optimal operation of energy systems, while also considering the additional criteria for conserving resources and enabling sustainability, environmental compatibility and cost effectiveness.
- The graduates are familiarized with the situation from the professional life for having to choose between technical alternatives, in order to minimize the environmental and social footprint of their engineering activities and so contribute effectively to the Energy Transition.
- The graduates are capable to extend their knowledge and expand their professional competencies beyond the purely technical level, through non-technical lectures.

Skills

In the Bachelor study program of Energy and Environmental Engineering the skill of using learnt knowledge to

solve specific problems is strengthened in various ways:

- The graduates master appropriate and subject relevant methods and tools, they appraise their computing ability and complexity and can put into practice appropriate programming tools.
- The students are in a position to map a general description for a partial problem within their discipline or a neighboring subject area, and can select appropriate methods for problem solving.
- The graduates possess the ability to understand and further analyze energy processes, draw balances in energy systems and identify technical and economic relationships between conventional and renewable energy technologies.
- The graduates can identify and describe in general the environmental impact and develop control strategies to relieve the environmental pressures from industrial plant. To this ability contribute also acquired skills from the neighboring disciplines of measurement technology and process and environmental engineering.
- The graduates are competent to identify the goals of an energy technical project, a plant or the society as a whole, aimed at satisfying the energy demand in a balanced and sustainable manner. They can set priorities responsibly and select the optimal problem solution approaches.
- The graduates can present their solution procedure and results in writing and explain them orally. They master presentation techniques and have obtained practice in technical communication.
- The graduates are capable to plan and conduct autonomously experiments, and interpret the results obtained.
- The graduates can apply measurement, control and regulation techniques or use construction methods.
- The graduates are proficient in sketching processes, machines and apparatuses that fulfill set specifications.

Social Skills

Social competence includes the individual ability and desire to work together with others in achieving set targets, to consider the interests of others, to express oneself clearly, and ultimately to contribute to the common work and living environments.

- The graduates can find themselves within a disciplinary homogeneous team, work out a solution approach, undertake specific partial tasks and deliver responsibly part results. They can also deliberate on their own contribution.
- The graduates are in a position to discuss the results of their scientific work interactively and multidisciplinary, to present them to an audience and defend them.
- The graduates are able to communicate with specialists and the public on contents and problems in energy and environmental engineering.

Autonomy

The interpersonal skills encompass, beyond autonomous handling, also the ability to further develop one's own capacity to act.

- The graduates can investigate independently a narrowly focused part of energy and environmental engineering and summarize in a seminar the results in detail, using current presentation techniques or a multi-page essay. During these assignments they are required to exercise critical analysis and not merely rote learning.
- The graduates can assess their own pre-existing competencies realistically and by themselves reverse deficiencies.
- The graduates can organize and perform projects autonomously.
- The graduates are in a position to carry out confined technical partial projects, by applying stand-alone the skills acquired during the study, in the framework of a Bachelor thesis.
- The graduates are able to acquire alone necessary information from suitable literature sources and assess its quality.
- The graduates are in a position to contemplate technical issues in a broader social context and appraise the non-technical impact of their engineering actions.

Program structure

The curriculum of the Bachelor of Energy and Environmental Engineering, which is received as a first degree, contains mainly compulsory lectures. Optional choices are allowed within the supplementary courses of the non-technical fields.

The structure of the degree is:

- Mathematical and scientific fundamentals (six modules)
- Engineering fundamentals (eleven modules)
- Energy and environmental engineering subjects (five modules)
- Engineering applications (three modules).

Additionally, the following non-technical contents are included:

- one module on management
- Further supplementary lectures from the list of non-technical options (one module)
- The Bachelor thesis in the 6th semester.

In this manner the Bachelor of Energy and Environmental Engineering comprises 28 Modules split into 26 technical Modules and two non-technical supplementary Modules. In the degree study special emphasis is also given to deepen the theoretical fundamental knowledge in energy and environmental subjects towards engineering applications. The Bachelor thesis completes the degree and is based on a wide spectrum of mathematical/physical and scientific fundamentals.

Core qualification

The graduates gain a fundamental knowledge of the physical and engineering basics of Mathematics, Physics, Chemistry, Mechanics, Thermodynamics and Materials Science. This enables them to understand phenomena present in Energy Systems, Environmental Engineering and associated disciplines. They understand the fundamental principles of energy and environmental technology for modelling and simulating energy conversion and energy, material and impulse transport processes under consideration of sustainability. They are proficient also in measurement, regulation and control techniques as well as constructive methods.

The graduates are able to:

- formulate and solve technical problems from first principles:
- deepen systematically into processes and methods of their discipline, in order to analyse and evaluate them;
- choose and apply appropriate analysis, modelling, simulation and optimisation methods;
- perform literature surveys and use for their studies databases and other information sources;
- independently plan and perform experiments and interpret the results;
- successfully embark in a Master degree in Energy and Environmental Engineering.

The graduates can perform competently and responsibly various engineering tasks in Energy and Environmental Engineering and become the right to carry the professional title of "Engineer" along the lines of the engineering regulations of the German Federal Lands (IngG).

|-----------------------------------|--|
| Admission Requirements | None |
| Recommended Previous Knowledge | None |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| | The Non-technical Academic Programms (NTA) |
| | imparts skills that, in view of the TUHH's training profile, professional engineering studie require but are not able to cover fully. Self-reliance, self-management, collaboration ar professional and personnel management competences. The department implements the training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting f specific competences and a competence level at the Bachelor's or Master's level. Th teaching offerings are pooled in two different catalogues for nontechnical complementa courses. |
| | The Learning Architecture |
| | consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses. |
| | The learning architecture demands and trains independent educational planning as regard the individual development of competences. It also provides orientation knowledge in the for of "profiles" |
| | The subjects that can be studied in parallel throughout the student's entire study program - need be, it can be studied in one to two semesters. In view of the adaptation problems the individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course studies. |
| | Teaching and Learning Arrangements |
| | provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in speci- courses. |
| Knowledge | Fields of Teaching |
| Knowledge | are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, migration studies, communication studies and sustainability researc and from engineering didactics. In addition, from the winter semester 2014/15 students on a Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way. |
| | The fields of teaching are augmented by soft skills offers and a foreign language offer. Her the focus is on encouraging goal-oriented communication skills, e.g. the skills required l outgoing engineers in international and intercultural situations. |
| | The Competence Level |

[11]

| | of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc. |
|-------------------|--|
| | This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life. |
| | Specialized Competence (Knowledge) |
| | Students can |
| | locate selected specialized areas with the relevant non-technical mother discipline, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject. |
| | Professional Competence (Skills) |
| | In selected sub-areas students can |
| Skills | apply basic methods of the said scientific disciplines, auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject. |
| Personal | |
| Competence | |
| | Personal Competences (Social Skills) |
| Social Competence | Students will be able to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge. |
| | |
| | Personal Competences (Self-reliance) |
| Autonomy | Students are able in selected areas to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) |
| Workload in Hours | Depends on choice of courses |
| | [12] |

| Content | This laboratory course comprises the following four topics, i) atomic structure and application of spectroscopic methods, introduction of analytic methods ii) chemical reactions (qualitative analysis), bonding types, reaction types, reaction equations iii) acid-base concepts, acid-base reactions in water, buffer solution, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, galvanic elements and electrolysis. Prior to every experiment, a seminar takes place in small groups (12-15 students). The students participate orally. Team work and cooperation are forwarded because the experiments in the lab and the writing of the reports is conducted in groups of three or four students. Additionally, acedemic writing conveyed (documentation of experiment results in lab journals, literature citations in reports). | | |

| Cycle | WiSe | | |
| Content | The course is made up of three components: Lectures by invited speakers, excursions and talks by the students. The lectures by invited speakers are connected to the companies where the excursions take place. From the results of the excursions the students prepare their talks under supervision from faculty staff. The talks are presented to the group and discussed. Some example topics are: • Conventional steam power plants and combined-cycle power plants • Power plant components (boiler, steam turbine, condenser, feed water heaters, etc.) • Distributed electricity generation and energy supply • District and neighbourhood heating networks • Renewable energy • Energy storage • Electric grids • Energy management at end-user level • Energy-intensive industries • Environmental technology (e.g., wastewater treatment plants) | | |

| Content | In the physics lab a number of key experiments on physical phenomena in mechanics, oscillatory and wave motion, thermodynamics, electricity, and optics will be conducted by the students under assistance of a lecturing tutor. The experiments are part of the physics education program presented in the course "Physics for TUHH-VT Engineers". Beyond teaching of fundamental physical background the objectives are basic skills in preparation and performing physical measurements, usage of physical equipment, analysis of the results and preparation of a report on the experimental data. The students receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing. Before every experiment an colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with the corresponding experiment. |
| Literature | Zu den Versuchen gibt es individuelle Versuchsanleitungen, die vor der Versuchsdurchführung ausgegeben werden. Zum Teil müssen die zur Versuchsdurchführung notwendigen physikalischen Hintergründe selbstständig erarbeitet werden, wozu die zur Vorlesung "Physik für TUHH-VT Ingenieure" angegebene Literatur gut geeignet ist. |

| Knowledge | Students are familiar with basic concepts of organic chemistry. They are able to classify organic molecules and to identify functional groups and to describe the respective synthesis routes. Fundamental reaction mechanisms like nucleophilic substitution, eliminations, additions and aromatic substitution can be described. Students are capable to describe in general modern reaction mechanisms. | | | | | |
| Skills | Students are able to us Especially they are able by this to optimise techn verbally formulated mes The students are able scientifically. | e to formulate nical process sage into an | basic routes to es in Process E abstract formal (| synthesize s ngineering. procedure. | mall organic r They are able | nolecules and to transform a |
| Personal Competence | | | | | | |
| Social Competence | The students are able to | discuss in sr | nall groups and | develop an a | approach for g | iven tasks. |
| | Students are able to ge use the knowledge in pr | | edge from existi | ng knowledg | e as well as t | o find ways to |

|---------------------------------|--|--|
| Тур | Lecture | |
| Hrs/wk | 4 | |
| СР | 4 | |
| Workload in Hours | Independent Study Time 64, Study Time in Lecture 56 | |
| Lecturer | Dr. Axel Thomas Neffe | |
| Language | DE | |
| Cycle | SoSe | |
| Content | The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. | |

| Cycle | SoSe |
| Content | The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course. |

| Previous Knowledge | | | |
|----------------------------|---|--|--|
| Educational Objectives | After taking part successfully, students have reached the following learning results | | |
| Professional Competence | | | |
| Knowledge | Students can name the basic concepts in the area of analysis and differential equations. They are able to explain them using appropriate examples. Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples. They know proof strategies and can reproduce them. | | |
| Skills | Students can model problems in the area of analysis and differential equations with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods. Students are able to discover and verify further logical connections between the concepts studied in the course. For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results. | | |
| Personal Competence | | | |
| Social Competence | Students are able to work together in teams. They are capable to use mathematics as a common language. In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers. | | |
| Autonomy | Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them. Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems. | | |

| Professional | | | | | |
| Competence | | | | | |
| Knowledge | The students have acquired a fundamental knowledge on metals, ceramics and polymers and c a n describe this knowledge comprehensively. Fundamental knowledge here means specifically the issues of atomic structure, microstructure, phase diagrams, phase transformations, corrosion and mechanical properties. The students know about the key aspects of characterization methods for materials and can identify relevant approaches for characterizing specific properties. They are able to trace materials phenomena back to the underlying physical and chemical laws of nature. | | | | |
| Skills | The students are able to trace materials phenomena back to the underlying physical and chemical laws of nature. Materials phenomena here refers to mechanical properties such a strength, ductility, and stiffness, chemical properties such as corrosion resistance, and to phase transformations such as solidification, precipitation, or melting. The students can explain the relation between processing conditions and the materials microstructure, and the can account for the impact of microstructure on the material's behavior. | | | | |

| Recommended Previous Knowledge | Mathematics I+II+III Technical Mechanics I+II Technical Thermodynamics I+II Working with force balances Simplification and solving of partial differential equations Integration | | | | |
| Educational Objectives | After taking part successfully stude | nts have reached the following lea | arning resu | ts | |
| Professional Competence | | | | | |
| Knowledge | Students are able to: explain the difference between different types of flow give an overview for different applications of the Reynolds Transport-Theorem in process engineering explain simplifications of the Continuity- and Navier-Stokes-Equation by using physical boundary conditions | | | | |
| Skills | The students are able to describe and model incompressible flows mathematically reduce the governing equations of fluid mechanics by simplifications to archive quantitative solutions e.g. by integration notice the dependency between theory and technical applications use the learned basics for fluid dynamical applications in fields of process engineering | | | | |
| Personal Competence | | | | | |
| Social Competence | The students are capable to gather information from subject related, professional publications and relate that information to the context of the lecture and able to work together on subject related tasks in small groups. They are able to presen their results effectively in English (e.g. during small group exercises) are able to work out solutions for exercises by themselves, to discuss the solutions orally and to present the results. | | | | |
| Autonomy | The students are able to search further literature for each topic and to expand their knowledge with this literature, work on their exercises by their own and to evaluate their actual knowledge with the feedback. | | | | |

| Content | In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards. |

| Course L0882: Management Tutorial | | |
|-----------------------------------|---|--|
| Тур | Recitation Section (large) | |
| Hrs/wk | 2 | |
| СР | 3 | |
| Workload in Hours | Independent Study Time 62, Study Time in Lecture 28 | |
| Lecturer | Prof. Christoph Ihl, Katharina Roedelius, Tobias Vlcek | |
| Language | DE | |
| Cycle | WiSe/SoSe | |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on self-selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the business knowledge from the lecture should come to practical use. The group projects are guided by a mentor. | |
| Literature | Relevante Literatur aus der korrespondierenden Vorlesung. | |

Module M0538: Heat and Mass Transfer Courses Title Hrs/wk СР Typ Heat and Mass Transfer (L0101) Lecture 2 2 Heat and Mass Transfer (L0102) Recitation Section (small) 1 2 2 Heat and Mass Transfer (L1868) Recitation Section (large) 1 Module Responsible Prof. Irina Smirnova Admission None Requirements Basic knowledge: Technical Thermodynamics Recommended **Previous Knowledge** Educational After taking part successfully, students have reached the following learning results Objectives Professional Competence The students are capable of explaining qualitative and determining quantitative heat transfer in procedural apparatus (e.g. heat exchanger, chemical reactors). They are capable of distinguish and characterize different kinds of heat transfer mechanisms namely heat conduction, heat transfer and thermal radiation. The students have the ability to explain the physical basis for mass transfer in detail and to describe mass transfer qualitative and quantitative by using suitable mass Knowledge transfer theories. They are able to depict the analogy between heat- and mass transfer and to describe complex linked processes in detail. The students are able to set reasonable system boundaries for a given transport problem by using the gained knowledge and to balance the corresponding energy and mass flow, respectively. They are capable to solve specific heat transfer problems (e.g. heated chemical reactors, temperature alteration in fluids) and to calculate the corresponding heat flows. Using dimensionless quantities, the students can execute scaling up of technical processes or apparatus. They are able to distinguish between diffusion, convective mass transition and mass transfer. They can use this knowledge for the description and design of apparatus (e.g. Skills extraction column, rectification column). In this context, the students are capable to choose and design fundamental types of heat and mass exchanger for a specific application considering their advantages and disadvantages, respectively. In addition, they can calculate both, steady-state and non-steady-state processes in procedural apparatus. The students are capable to connect their knowledge obtained in this course with knowlegde of other courses (In particular the courses thermodynamics, fluid mechanics and chemical process engineering) to solve concrete technical problems. Personal Competence

| Social Competence | The students are capable to work on subject-specific challenges in teams and to present the results orally in a reasonable manner to tutors and other students. |
|---|--|
| Autonomy | The students are able to find and evaluate necessary information from suitable sources They are able to prove their level of knowledge during the course with accompanying procedure continuously (clicker-system, exam-like assignments) and on this basis they can control their learning processes. |

| Educational Objectives | After taking part successfully, students have rea | ached the following lea | rning resul | ts |
| Professional Competence | | | | |
| | The students can distinguish and des such as distillation extraction and adsort | | of separati | on proce |

- such as distillation, extraction, and adsorption The students develop an understanding for the course of concentration during a separation process, the estimation of the energy demand of a process, the possibilities
- of energy saving, and the selection of separation systems They have good knowledge of designing methods for separation processes and
- devices
 - Using the gained knowledge the students can select a reasonable system boundary for a given separation process and can close the associated energy and material balances
 - The students can use different graphical methods for the designing of a separation process and define the amount of theoretical stages required
 - They can select and design a basic type of thermal separation process for a given case based on the advantages and disadvantages of the process
 - The students are capable to obtain independently the needed material properties from appropriate sources (diagrams and tables)
 - They can calculate continuous and discontinuous processes
 - The students are able to prove their theoretical knowledge in the experimental lab work.
 - The students are able to discuss the theoretical background and the content of the experimental work with the teachers in colloquium.

The students are capable of linking their gained knowledge with the content of other lectures and use it together for the solution of technical problems. Other lectures such as thermodynamics, fluid mechanics and chemical engineering.

Personal Competence

Skills

Knowledge

The students can work technical assignments in small groups and present the combined results in the tutorial

| Social Competence | • The students are able to carry out practical lab work in small groups and organize a functional division of labor between them. They are able to discuss their results and to document them scientifically in a report. | | | | | |
|---|--|--|--|--|--|--|
| Autonomy | The students are capable to obtain the needed information from suitable sources by themselves and assess their quality The students can proof the state of their knowledge with exam resembling assignments and in this way control their learning process | | | | | |

| Content | The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and fellow students. The students work small groups with a high degree of division of labor. For every experiment the students write a report. They receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they can increase their capabilities in this area. Topics of the practical course: Introduction in the thermal process engineering and to the main features of separation processes Simple equilibrium processes, several steps processes Distillation of binary mixtures, enthalpy-concentration diagrams Extractive and azeotrope distillation, water vapor distillation, stepwise distillation Extraction: separation including complex mixtures Designing of separation processes Multiphase separation devices without discrete stages Drying Chromatographic separation processes Advance overview of separation processes Selection of separation processes | | | | |

| Cycle | WiSe | | | | |
| Content | In the 1 st part of the lecture an overview on thermal power plants is offered, including: Electricity demand and Forecasting Thermodynamic fundamentals Energy Conversion in thermal power plants Types of power plant Layout of the power plant block Individual elements of the power plant Cooling systems Flue gas cleaning Operation characteristics of the power plants Location of power plants Location of power plants Solar thermal plants/geothermal plants/Carbon Capture and Storage plants. These are complemented in the 2 nd part of the module by the more specialised issues: Energy balance of a turbomachine Theory of turbine and compressor stage Equal and positive pressure blading Flow losses Characteristic numbers Axial and radial design Design features Hydraulic turbomachines Pump and water turbine designs Design examples of reciprocating engines and turbomachinery Steam power plants | | | | |

| In the 1 st part of the lecture a general introduction into fluid-flow machines and steam power plants is offered, including: |
| Energy balance of a fluid-flow machine Theory of turbine and compressor stage Equal and positive pressure blading Flow losses Characteristic numbers Axial and radial design Design features Hydraulic fluid-flow machines Pump and water turbine designs Design examples of reciprocating engines and turbomachinery Steam power plants Gas turbine systems Diesel engine systems Waste heat utilisation followed by the more specialised issues: Electricity Demand and Forecasting Thermodynamic fundamentals Energy Conversion in Thermal Power Plants Types of Power Plant Layout of the power plant Cooling systems Flue gas cleaning Operation characteristics of the power plant Construction materials Location of power plants The environmental impact of acidification, fine particulate or CO₂ emissions and the resulting climatic effects are a special focus of the lecture and the lecture hall exercise. The challenges in plant operation form interconnecting conventional power plants and renewable energy sources are discussed and the technical options for providing security of supply and network stability are presented, also under consideration of cost effectiveness. In this critical review, stability are presented, also under consideration of cost effectiveness. In this critical review, stability are presented, also under consideration providing security of supply and network stability are presented, also under consideration providing security of supply and network stability are presented, also under consideration solutions with the environment and climate. With this, the awareness for the responsibility of an engineer's own actions are emphasized and the potential extent of the different solutions presented clearly. |

| Module Responsible | Dr. Sven Krause | | |
|---|---|--|--|
| Admission Requirements | None | | |
| Recommended Previous Knowledge | Basic knowledge of physics, chemistry and electrical engineering | | |
| Educational Objectives | After taking part successfully, students have reached the following learning results | | |
| Professional | | | |
| Competence | | | |
| | Students are able to name the most important fundmentals of the Measurement Technology (Quantities and Units, Uncertainty, Calibration, Static and Dynamic Properties of Sensors and Systems). | | |
| Knowledge | They can outline the most important measuring methods for different kinds of quantities to be maesured (Electrical Quantities, Temperature, mechanical quantities, Flow, Time, Frequency). | | |
| | They can describe important methods of chemical Analysis (Gas Sensors, Spectroscopy, Gas Chromatography) | | |
| Skills | Students can select suitable measuring methods to given problems and can use refering measurement devices in practice. The students are able to orally explain issues in the subject area of measurement technology and solution approaches as well as place the issues into the right context and application | | |
| Personal Competence Social Competence | Students can arrive at work results in groups and document them in a common report. | | |
| Autonomy | Students are able to familiarize themselves with new measurement technologies. | | |

| Content | The experiment demonstrates the effect of ionic strength on the binding of dissolved zinc and phosphate by soil surfaces. From the results it can be inferred that the potential of soil surfaces is modified by the application of salt. This has consequences for the retention of nutrients and pollutants. The experiment is carried out with iron oxide rich soil material. Within the lab course students discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They discuss different approaches to the task as well as it's theoretical or practical implementation. |

| Module Responsible Admission | | l | | | |
| Requirements | None | | | | |
| Recommended Previous Knowledge | Fundamentals of inorg | anic/organic cher | nistry and biology | | |
| Educational Objectives | After taking part succe | ssfully, students h | ave reached the following | ng learning resu | ılts |
| Professional Competence | | | | | |
| - | With the completion of this module the students acquire in-depth knowledge of importan cause-effect chains of potential environmental problems which might occur from production processes, projects or construction measures. They have knowledge about the methodological diversity and are competent in dealing with different methods and instruments to assess environmental impacts. Besides the students are able to estimate the complexity o these environmental processes as well as uncertainties and difficulties with their measurement. | | | | |
| | The students are able to select a suitable method for the respective case from the variety of assessment methods. Thereby they can develop suitable solutions for managing an mitigating environmental problems in a business context. They are able to carry out Life Cycle Impact Assessments independently and can apply the software programs OpenLCA and the database EcoInvent. After finishing the course the students have the competence to criticall judge research results or other publications on environmental impacts. | | | | |
| Personal Competence | | | | | |
| Social Competence | The students are able to discuss the various technical and scientific tasks, both subject specific and multidisciplinary. They are able to develop jointly different solutions and t discuss their theoretical or practical implementation. Due to the selected lecture topics, th students receive insights into the multi-layered issues of the environment protection and th concept of sustainability. Their sensitivity and consciousness towards these subjects ar raised and which helps to raise their awareness of their future social responsibilities in the role as engineers. | | | | |
| Autonomy | The students learn to research, process and present a scientific topic independently. They are able to carry out independent scientific work. They can solve an environmental problem in a business context and are able to judge results of other publications. | | | | |

| Title | Typ Hrs/wk CP |
| | Professoren der TUHH |
| Admission Requirements | |
| Recommended Previous Knowledge | |
| Educational Objectives | Atter taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods). On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise. The students are able to outline the state of research on a selected issue in their subject area. |
| Skills | The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems. With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions. The students can take up a critical position on the findings of their own research work from a specialized perspective. |
| Personal Competence | |
| Social Competence | Both in writing and orally the students can outline a scientific issue for an experiaudience accurately, understandably and in a structured way. The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly. |
| Autonomy | The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame. The students are able to identify, open up, and connect knowledge and materia necessary for working on a scientific problem. The students can apply the essential techniques of scientific work to research of thei own. |
