Program description

Content

One of the main challenges in modern society is the reliable, environmentally benign and sustainable supply of energy. An efficient energy supply is moreover essential to secure the economic future of the country.

The exponential increase in world population, the raised living standards and the continuously increasing hunger for feedstocks, acreage and energy make the sustainable handling of natural resources imperative. This includes the reduction of emissions and the minimization of environmental impact. An example with growing significance is the control of the CO_2 emissions that are responsible for the greenhouse effect. For this, possibilities are sought after that bring energy savings or involve increased use of renewable energy sources. In a continued utilization of fossil fuels the reduction of CO_2 emissions is pursued by increasing efficiency and also through separation and underground storage of the CO_2 emitted. The latter approaches make a close cooperation between Energy Engineering and Environmental Engineering unavoidable.

The consecutive degree in Energy and Environmental Engineering had been started already in the beginning of the century in the form of a corresponding Diploma course. The motivation for this development was on the one hand the increasing significance of environmental protection through CO_2 separation in large power stations and, on the other, the growing supply of electricity from regenerative energy sources. Both these key developments in electricity generation are taken into consideration in designing the Bachelor course. Not only for the CO_2 separation technologies but also for other environmental protection purposes, as for example air pollution protection, a wide spectrum of chemistry lectures is incorporated and this contrasts markedly the classical power station engineering curriculum. Renewable electricity generation is covered in the Bachelor degree from a generalist viewpoint only. First in the Master degree of Energy and Environmental Engineering special renewable energy topics are included, to expand the conventional energy systems engineering curriculum. At Master level and in addition to the above mentioned air pollution prevention, also the environmental protection of water and soils are covered.

The Bachelor of Energy and Environmental Engineering conveys a wide and well-founded multidisciplinary fundamental knowledge in the disciplines of Energy Engineering and of Environmental Engineering. This includes a well-grounded understanding over the basic methods of engineering (mathematics, mechanics, thermodynamics, fluid mechanics, chemistry, process engineering, materials engineering and engineering construction). Moreover, basic skills in environmental assessment and environmental technology and particle technology, along with non-technical subjects, are conveyed. These provide necessary qualifications for elaborating the supporting processes during system development. At the skills level the Bachelor degree prepares the student for a Master study or even a PhD research, too, so that after graduation also professional qualifications suitable for a potential future research career are gained.

Career prospects

The operating conditions of the energy market and the environmental protection are subjected to increasingly accelerating changes. To account for this in the degree study, special attention is given to convey future-proof knowledge. This enables the students to be easily adaptable to market changes, so that also in future developments they can react autonomously, adapt successfully to their desired placement targets and extend their professional horizons independently. Towards this aim the Bachelor of Energy and Environmental Engineering covers a wide scientific and methodological basis curriculum

The graduates, after completion of the study program, possess a wide spectrum of fundamental knowledge in the subject areas of energy systems and environmental engineering. They are thus in a position to articulate the fundamental principles of modelling and simulating energy conversion systems encompassing energy, mass and momentum transport processes, while they pay particular attention to sustainability. The graduates are able to analyze energy processes, evaluate the energetically and economically optimal operation of energy systems, draw balances of energy plants and comprehend the technical and economic interplay between conventional and renewable energy technologies. The graduates are in a position to describe the construction, operation and organization of power plants and to explain the constructive characteristics of energy systems and their components. They can also master the automatic control measures used. They can identify the environmental impact in general and develop specific strategies for mitigating the various environmental risks emanating from industrial plant. The students obtain practice in critically studying a problem of their discipline, classify it within their subject area and orally elaborate suitable solution procedures.

The graduates are in a position to undertake responsibly engineering tasks in various activity fields within energy and environmental engineering and carry them out competently. They are allowed to use the professional title "Ingenieur/Ingenieurin" in accordance with the legal framework (IngG) of the German Federal Lands. They furthermore acquire the necessary scientific knowledge for a subsequent, deeper Master study.

Continuous interaction with Industry within the framework of joint research or through further contact opportunities enables to closely follow the increasingly accelerating changes in qualification profiling demanded by the market. This facilitates the continuous adjustment of the curricular contents of the Bachelor of Energy and Environmental Engineering to the prevailing market conditions.

Learning target

The Bachelor of Energy and Environmental Engineering endeavors to give to the graduate not only a professional qualification but also prepare the student for a consecutive Master study program. The essential basic methodological skills to do this are conveyed through a combination of basic and advanced learning modules from Mechanical Engineering, Process Engineering and Environmental Engineering.

Through contributions in the lectures by professional engineers from industry, by using software tools established in the praxis for performing simplified tutorials or by means of on-site visits, the students are able to acquire during their study a realistic overview of the multifaceted professional field of Energy and Environmental Engineering. This strengthens the future career chances of the graduates substantially. The possibility to perform external Bachelor thesis work offers an additional exposure to real professional practice.

The graduates can undertake engineering tasks in various fields of activity in energy and environmental engineering and complete them responsibly and competently. In addition, they acquire the necessary scientific skills for a subsequent more focused Master study.

Knowledge

The background knowledge acquired during the Bachelor study program enables the graduate to understand phenomena incurring in Energy Systems, Environmental Engineering or neighboring disciplines. The graduates learn the basic principles of energy and environmental technology for modelling and simulating the energy conversion and the energy, matter and momentum transfer processes involved, while taking also into account sustainability and environmental protection. Their knowledge consists of facts, basic methods and theories, which are conveyed during the Bachelor of Energy and Environmental Engineering in the following manner:

- The graduates are able to articulate their basic knowledge in subject areas of the natural and engineering sciences such as mathematics, chemistry, mechanics, thermodynamics, fluid mechanics, informatics, materials science, electrical engineering and construction engineering.
- The graduates can utilize basic methods and solution approaches for iterative decision making and optimization of problems, such as differentiation, gradient based approaches or hypothesis testing. They can also analyze and evaluate the above methods as regards complexity, convergence and merit.
- Through further specialized knowledge in the subject areas (Process Engineering, Energy Systems and Environmental Technology) the graduates can describe and compare different layouts of energy processes. This applies to both conventional and renewable energy plants. They can also evaluate the environmental impact from these energy facilities.
- The graduates can describe the structure, operation and organization of conventional and regenerative energy plants and their components. This includes also the automatic control systems used therein. They are competent to identify the facets for an energetically and economically optimal

operation of energy systems, while also considering the additional criteria for conserving resources and enabling sustainability, environmental compatibility and cost effectiveness

- The graduates are familiarized with the situation from the professional life for having to choose between technical alternatives, in order to minimize the environmental and social footprint of their engineering activities and so contribute effectively to the Energy Transition.
- The graduates are capable to extend their knowledge and expand their professional competencies beyond the purely technical level, through non-technical lectures.

Skills

In the Bachelor study program of Energy and Environmental Engineering the skill of using learnt knowledge to solve specific problems is strengthened in various ways:

- The graduates master appropriate and subject relevant methods and tools, they appraise their computing ability and complexity and can put into practice appropriate programming tools.
- The students are in a position to map a general description for a partial problem within their discipline or a neighboring subject area, and can select appropriate methods for problem solving.
- The graduates possess the ability to understand and further analyze energy processes, draw balances in energy systems and identify technical and economic relationships between conventional and renewable energy technologies.
- The graduates can identify and describe in general the environmental impact and develop control strategies to relieve the environmental pressures from industrial plant. To this ability contribute also acquired skills from the neighboring disciplines of measurement technology and process and environmental engineering.
- The graduates are competent to identify the goals of an energy technical project, a plant or the society as a whole, aimed at satisfying the energy demand in a balanced and sustainable manner. They can set priorities responsibly and select the optimal problem solution approaches.
- demand in a balanced and sustainable manner. They can set priorities responsibly and select the optimal problem solution approaches.
 The graduates can present their solution procedure and results in writing and explain them orally. They master presentation techniques and have obtained practice in technical communication.
- The graduates are capable to plan and conduct autonomously experiments, and interpret the results obtained.
- · The graduates can apply measurement, control and regulation techniques or use construction methods.
- The graduates are proficient in sketching processes, machines and apparatuses that fulfill set specifications.

Social Skills

Social competence includes the individual ability and desire to work together with others in achieving set targets, to consider the interests of others, to express oneself clearly, and ultimately to contribute to the common work and living environments.

- The graduates can find themselves within a disciplinary homogeneous team, work out a solution approach, undertake specific partial tasks and deliver responsibly part results. They can also deliberate on their own contribution.
- The graduates are in a position to discuss the results of their scientific work interactively and multidisciplinary, to present them to an audience and defend them.
- The graduates are able to communicate with specialists and the public on contents and problems in energy and environmental engineering.

Autonomy

The interpersonal skills encompass, beyond autonomous handling, also the ability to further develop one's own capacity to act.

- The graduates can investigate independently a narrowly focused part of energy and environmental engineering and summarize in a seminar the results in detail, using current presentation techniques or a multi-page essay. During these assignments they are required to exercise critical analysis and not merely rote learning.
- The graduates can assess their own pre-existing competencies realistically and by themselves reverse deficiencies.
- The graduates can organize and perform projects autonomously.
- The graduates are in a position to carry out confined technical partial projects, by applying stand-alone the skills acquired during the study, in the framework of a Bachelor thesis.
- The graduates are able to acquire alone necessary information from suitable literature sources and assess its quality.
- The graduates are in a position to contemplate technical issues in a broader social context and appraise the non-technical impact of their engineering actions.

Program structure

The curriculum of the Bachelor of Energy and Environmental Engineering, which is received as a first degree, contains mainly compulsory lectures. Optional choices are allowed within the supplementary courses of the non-technical fields.

The structure of the degree is:

- Mathematical and scientific fundamentals (six modules)
- Engineering fundamentals (eleven modules)
- Energy and environmental engineering subjects (five modules)
- Engineering applications (three modules).

Additionally, the following non-technical contents are included:

- one module on management
- Further supplementary lectures from the list of non-technical options (one module)
- The Bachelor thesis in the 6th semester.

In this manner the Bachelor of Energy and Environmental Engineering comprises 28 Modules split into 26 technical Modules and two non-technical supplementary Modules. In the degree study special emphasis is also given to deepen the theoretical fundamental knowledge in energy and environmental subjects towards engineering applications. The Bachelor thesis completes the degree and is based on a wide spectrum of mathematical/physical and scientific fundamentals.

Core Qualification

The graduates gain a fundamental knowledge of the physical and engineering basics of Mathematics, Physics, Chemistry, Mechanics, Thermodynamics and Materials Science. This enables them to understand phenomena present in Energy Systems, Environmental Engineering and associated disciplines. They understand the fundamental principles of energy and environmental technology for modelling and simulating energy conversion and energy, material and impulse transport processes under consideration of sustainability. They are proficient also in measurement, regulation and control techniques as well as constructive methods.

The graduates are able to:

- formulate and solve technical problems from first principles:
- deepen systematically into processes and methods of their discipline, in order to analyse and evaluate them;
- choose and apply appropriate analysis, modelling, simulation and optimisation methods;
- perform literature surveys and use for their studies databases and other information sources;
- independently plan and perform experiments and interpret the results;
- successfully embark in a Master degree in Energy and Environmental Engineering.

The graduates can perform competently and responsibly various engineering tasks in Energy and Environmental Engineering and become the right to carry the professional title of "Engineer" along the lines of the engineering regulations of the German Federal Lands (IngG).

Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	

Knowledae

The Non-technical Academic Programms (NTA)

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles'

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goaloriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- locate selected specialized areas with the relevant non-technical mother discipline,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic methods of the said scientific disciplines,
- auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist
- to handle simple questions in aforementioned scientific disciplines in a sucsessful manner.
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

Personal Competence

Social Competence

Personal Competences (Social Skills)

Students will be able

· to learn to collaborate in different manner.

Autonomy	 to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge. Personal Competences (Self-reliance) Students are able in selected areas to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)

Cycle	WiSe
Content	This elementary course in chemistry comprises the following four topics, i) molecular orbital theory applied to compounds with bonds between s-, p- and d-block elements (octahedral field only), Description of molecular interactions in the gas, liquid and solid phase, (semi) conductivity on account of the formation of band structures, ii) describing chemical reactions in the sense of retention of mass and energy, enthalpy and entropy, chemical equilibrium, concepts of activation energy in conjucture with particle kinetic energy iii) acid-base concepts, acid-base reactions in water, pH calculation, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, overpotential, corrosion (local elments).

Workload in Hours	Independent Study Time 18, Study Time in Lecture 42
Lecturer	Prof. Gerrit A. Luinstra
Language	DE
Cycle	WiSe
Content	This laboratory course comprises the following four topics, i) atomic structure and application of spectroscopic methods, introduction of analytic methods ii) chemical reactions (qualitative analysis), bonding types, reaction types, reaction equations iii) acid-base concepts, acid-base reactions in water, buffer solution, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, galvanic elements and electrolysis. Prior to every experiement, a seminar takes place in small groups (12-15 students). The students participate orally. Team work and cooperation are forwarded because the experiments in the lab and the writing of the reports is conducted in groups of three or four students. Additionally, acedemic writing conveyed (documentation of experiment results in lab journals, literature citations in reports).

Language	DE
Cycle	WiSe
Content	The course is made up of three components: Lectures by invited speakers, excursions and talks by the students. The lectures by invited speakers are connected to the companies where the excursions take place. From the results of the excursions the students prepare their talks under supervision from faculty staff. The talks are presented to the group and discussed. Some example topics are: Conventional steam power plants and combined-cycle power plants Power plant components (boiler, steam turbine, condenser, feed water heaters, etc.) Distributed electricity generation and energy supply District and neighbourhood heating networks Renewable energy Energy storage Electric grids Energy management at end-user level Energy-intensive industries Environmental technology (e.g., wastewater treatment plants)

Content	In the physics lab a number of key experiments on physical phenomena in mechanics, oscillatory and wave motion, thermodynamics, electricity, and optics will be conducted by the students under assistance of a lecturing tutor. Beyond teaching of fundamental physical background the objectives are basic skills in preparation and performing physical
	measurements, usage of physical equipment, analysis of the results and preparation of a report on the experimental data. The students receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing. Before every experiment an colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with the corresponding experiment.
Literature	Zu den Versuchen gibt es individuelle Versuchsanleitungen, die vor der Versuchsdurchführung ausgegeben werden. Zum Teil müssen die zur Versuchsdurchführung notwendigen physikalischen Hintergründe selbstständig erarbeitet werden. Content	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Module M0829: Found	dations of Management
-	
Courses	
Title	Typ Hrs/wk CP
Management Tutorial (L0882)	Recitation Section (small) 2 3
Introduction to Management (L088	
Module Responsible	Prof. Christoph Ihl
Admission Requirements	None
Recommended Previous	Basic Knowledge of Mathematics and Business
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	After taking this module, students know the important basics of many different areas in Business and Management, from Planning
5	and Organisation to Marketing and Innovation, and also to Investment and Controlling. In particular they are able to
	 explain the differences between Economics and Management and the sub-disciplines in Management and to name
	important definitions from the field of Management
	 explain the most important aspects of and goals in Management and name the most important aspects of entreprneurial
	projects
	describe and explain basic business functions as production, procurement and sourcing, supply chain management,
	organization and human ressource management, information management, innovation management and marketing
	explain the relevance of planning and decision making in Business, esp. in situations under multiple objectives and
	uncertainty, and explain some basic methods from mathematical Finance
	state basics from accounting and costing and selected controlling methods.
Skills	Students are able to analyse business units with respect to different criteria (organization, objectives, strategies etc.) and to carry
	out an Entrepreneurship project in a team. In particular, they are able to
	analyse Management goals and structure them appropriately
	analyse organisational and staff structures of companies
	apply methods for decision making under multiple objectives, under uncertainty and under risk
	analyse production and procurement systems and Business information systems
	analyse and apply basic methods of marketing
	select and apply basic methods from mathematical finance to predefined problems
	apply basic methods from accounting, costing and controlling to predefined problems
Personal Competence	
•	Students are able to
30Clai Competence	Students are able to
	work successfully in a team of students
	to apply their knowledge from the lecture to an entrepreneurship project and write a coherent report on the project
	to communicate appropriately and
	to cooperate respectfully with their fellow students.
	Cooperate respection, management and statement
Autonomy	Students are able to
	work in a team and to organize the team themselves
	to write a report on their project.
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70

Course L08	882: Management Tutorial
Тур	Recitation Section (small)
Hrs/wk	2
СР	3
Workload	Independent Study Time 62, Study Time in Lecture 28
in Hours	
Lecturer	Prof. Christoph Ihl, Katharina Roedelius
Language	DE
Cycle	WiSe/SoSe
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se
	selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin
	knowledge from the lecture should come to practical use. The group projects are guided by a mentor.
Literature	Relevante Literatur aus der korrespondierenden Vorlesung.

Electrical Machines and Actuators	1	Recitation Section (large)	2	2
Module Responsible	Prof. Thorsten Kern			
Admission Requirements				
Recommended Previous	Basics of mathematics, in particular complexe	e numbers, integrals, differentials		
Knowledge	Basics of electrical engineering and mechanic	cal engineering		
Educational Objectives	After taking part successfully, students have	reached the following learning results		
Professional Competence				
Knowledge	Students can to draw and explain the basic pr	rinciples of electric and magnetic fields.		
	They can describe the function of the sta	andard types of electric machines and proce	ant the correspon	odina oquations an
		andard types of electric machines and present they can explain the major parameters of the		
	from the power grid to the driven engine.	stricy can explain the major parameters of the	chergy emelency	or the whole system
Skills		nal electric and magnetic fields in particular fe	erromagnetic circ	uits with air gap. Fo
	this they apply the usual methods of the design	gn auf electric machines.		
	They can calulate the operational performan	nce of electric machines from their given chara	acteristic data an	d selected quantitie
	and characteristic curves. They apply the usu	al equivalent circuits and graphical methods.		
Personal Competence				
Social Competence	none			
Autonomy	Students are able independently to calculate	electric and magnatic fields for applications. T	hey are able to a	nalyse independent
	the operational performance of electric mac	hines from the charactersitic data and theycar	n calculate therec	of selected quantitie
	and characteristic curves.

Cycle	SoSe
Content	In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards.

Content	Experiment 1: Emission and immission measurement of gaseous pollutants: different technologies to determine different gaseous pollutants in automotive exhaust are used.
	Experiment 2: Simulation and measurement of asynchrone engine and rotary pump: the dynamic behaviour of e pump engine will be investigated. The starting will be simulated on a PC and compared with measurement.
	Experiment 3: Michelson interferometer and fiber optic: fundamental optical phenonema will be understood and applications with Michelson interferometer and optical fibers demonstrated.
	Experiment 4:Identification of the parameters of a control system and optimal control parameters

Content	The practical course Environmental Engineering currently consists of 5 experiments, which deal with the different focal points of environmental engineering in the areas of air, water, soil, energy and noise. The following experiments are carried out for this purpose: biological degradation of artificial materials, fine dust measurement in the air, water analysis, noise emission measurement, photovoltaic energy Within the lab course students discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They discuss different approaches to the task as well as it's theoretical or practical implementation.

-	The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and fellow students. The students work small groups with a high degree of division of labor. For every experiment, the students write a report. They		
	receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they can increase their capabilities in this area. Topics of the practical course:		
	 Introduction in the thermal process engineering and to the main features of separation processes Simple equilibrium processes, several steps processes Distillation of binary mixtures, enthalpy-concentration diagrams Extractive and azeotrope distillation, water vapor distillation, stepwise distillation Extraction: separation ternary systems, ternary diagram Multiphase separation including complex mixtures Designing of separation devices without discrete stages Drying Chromatographic separation processes Membrane separation Energy demand of separation processes Advance overview of separation processes Selection of separation processes

Module M0639: Gas a	nd Steam Powe	er Plants				
Courses						
Courses Title			Tym		Hrs/wk	СР
Gas and Steam Power Plants (L020	6)		Typ Lecti		3	5
Gas and Steam Power Plants (L021	0)		Reci	tation Section (large)	1	1
Module Responsible	Dr. Kristin Abel-Günth	er				
Admission Requirements	None					
Recommended Previous	"Technical The	rmodynamics I and II"				
Knowledge	"Heat Transfer	•				
	 "Fluid Mechani 	cs"				
Educational Objectives	After taking part succ	essfully, students have re	ached the following lea	arning results		
Professional Competence						
Knowledge	plant, describe the va operation characteris combination possibili equipped with Carbon	aluate the development of arious types of power plant stics of the power plant ties of conventional fossi of Capture and Storage.	at and the layout of the Additionally they ca Il-fuelled power plants	e steam generator block an describe the exhau with solar thermal an	c. They are also al ust gas cleaning d geothermal por	ole to determine the apparatus and the
Personal Competence	The students have basic knowledge about the principles, operation and design of turbomachinery The students will be able, using theories and methods of the energy technology from fossil fuels and based on well-founded knowledge on the function and construction of gas and steam power plants, to identify basic associations in the production of heat and electricity, so as to develop conceptual solutions. Through analysis of the problem and exposure to the inherent interplay between heat and power generation the students are endowed with the capability and methodology to develop realistic optimal concepts for the generation of electricity and the production of heat. From the technical basics the students become the ability to follow better the deliberations on the electricity mix composition within the energy-political triangle (economy, secure supply and environmental protection). Within the framework of the exercise the students learn the use of the specialised software suite EBSILON Professional TM. With this tool small practical tasks are solved with the PC, to highlight aspects of the design and development of power plant cycles. The students are able to do simplified calculations on turbomachinery either as part of a plant, as single component or at stage level. An excursion within the framework of the lecture is planned for students that are interested. The students get in this manner direct contact with a modern power plant in this region. The students will obtain first-hand experience with a power plant in operation and gain insights into the conflicts between technical and political issues. The students assisted by the tutors will be able to develop alone simple simulation models and run with these scenario analyses. In this manner the theoretical and practical knowledge from the lecture is consolidated and the potential effects from different process combinations and boundary conditions highlighted. The students are able independently to analyse the operational performance of steam power plants and

Course L0206: Gas and Stea	m Power Plants
Тур	Lecture
Hrs/wk	3
CP	5
Workload in Hours	Independent Study Time 108, Study Time in Lecture 42
Lecturer	Dr. Kristin Abel-Günther
Language	DE
Cycle	WiSe
Content	In the 1 st part of the lecture an overview on thermal power plants is offered, including:
	Electricity demand and Forecasting
	Thermodynamic fundamentals
	Energy Conversion in thermal power plants
	Types of power plant
	Layout of the power plant block
	Individual elements of the power plant
	Cooling systems
	Flue gas cleaning
	Operation characteristics of the power plant
	Construction materials for power plants
	Location of power plants
	Solar thermal plants/geothermal plants/Carbon Capture and Storage plants.
	These are complemented in the 2 nd part of the module by the more specialised issues:
	Energy balance of a turbomachine
	Theory of turbine and compressor stage
	Equal and positive pressure blading
	Flow losses
	Characteristic numbers
	Axial and radial design
	Design features
	Hydraulic turbomachines
	Pump and water turbine designs
	Design examples of reciprocating engines and turbomachinery
	Steam power plants
	Gas turbine systems.

	Operation characteristics of the power plant
	Construction materials
	Location of power plants
	The environmental impact of acidification, fine particulate or CO ₂ emissions and the resulting climatic effects are a special focu
	the lecture and the lecture hall exercise. The challenges in plant operation from interconnecting conventional power plants
	renewable energy sources are discussed and the technical options for providing security of supply and network stability
	presented, also under consideration of cost effectiveness. In this critical review, focus is especially placed on the compatibility
	the different solutions with the environment and climate. With this, the awareness for the responsibility of an engineer's of actions are emphasized and the potential extent of the different solutions presented clearly.
	actions are emphasized and the potential extent of the different solutions presented clearly.
	Within the framework of the exercise the students learn the use of the specialised software suite EBSILON Professional TM. With
	tool small tasks are solved on the PC, to highlight aspects of the design and development of power plant cycles. The stude
	present their results orally and can afterwards ask questions and get feedback. The course work has a positive effect on
	students final grade.

Knowledge				
Educational Objectives	After taking part successfully, students have reached	I the following learning results		
Professional Competence				
Knowledge	With completion of this module, the students can p	rovide an overview of characteristics	of energy systems	and their economic
	efficiency. They can explain the issues occurring in the	nis context. Furthermore, they can expl	ain details of powe	er generation, power
	distribution and power trading wih regard to sub	ject-related contexts. The students of	an explain these	aspects, which are
	applicable to many energy systems in general, espe	ecially for renewable energy systems a	and critical discuss	them. Furthermore,
	the students can explain the environmental benefits	from the use of such systems.		
Skills	Students are able to apply methodologies for detailed	ed determination of energy demand or	energy production	for various types o
	energy systems. Furthermore, they can evaluate end	ergy systems technically, environmenta	ally and economica	ally and design them
	under certain given conditions. Therefore, they	can choose the necessary subject-sp	pecific calculation	rules, also for no
	standardized solutions of a problem.			
	The shadest are able to contain a continue and a	illa annua ala a ka ika maa aasina faan		
	The students are able to explain questions and poss	sible approaches to its processing from	the field of renev	vable energies orally
	and to put them them into the right context.			
Personal Competence				
Social Competence	The students are able to analyze suitable technica	l alternatives and to assess them with	n technical, econo	mical and ecologica
	criteria under sustainability aspects. This allows then	n to make an effective contribuition to a	a more sustainable	power supply.
Autonomy	1	re the particular knowledge about the	subject area and	transform it to new
	questions.

Content	Students work on different tasks in the field of renewable energies. They present their solutions in the exercise lesson and discuss
	it with other students and the lecturer.
	Possible tasks in the field of renewable energies are:
	Solar thermal heat
	Concentrating solare power
	Photovoltaic
	Windenergie
	Hydropower
	Heat pump
	Deep geothermal energy

Thesis

Module M-001: Bachelor Thesis		
Courses		
Title	Typ Hrs/wk CP	
Module Responsible	Professoren der TUHH	
Admission Requirements	According to General Regulations §21 (1):	
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.	
Recommended Previous Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	 The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods). 	
	 On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise. The students are able to outline the state of research on a selected issue in their subject area. 	
Skills	 The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems. 	
	With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on	
	 technical issues, and develop solutions. The students can take up a critical position on the findings of their own research work from a specialized perspective. 	
Personal Competence Social Competence	 Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way. The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the 	
Autonomy	 The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame. The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem. The students can apply the essential techniques of scientific work to research of their own.
