Module M-001: Bachelor Thesis	180

Program description

Content

Climate change, high energy and resource consumption, disruption of ecosystems and a steadily growing world population are the challenges that humanity is already facing today. What the world of tomorrow will look like thus depends decisively on what solutions we find in dealing with these developments.

The degree programme "Green Technologies: Energy, Water, Climate" addresses precisely these issues. By combining specialist knowledge with technical and communication skills, we train engineers who think in an interdisciplinary and solution-oriented way. The focus is on "green" technologies for a sustainable, climate and resource-friendly energy and water supply.

In the first three semesters, the focus is on learning the basics of mathematics, mechanics, chemistry, computer science, thermodynamics as well as meteorology and climate. In the further course, the study programme is then expanded to include basic engineering subjects and the topics of regenerative energies as well as water supply and treatment. From the fourth semester onwards, you can choose a subject focus according to your personal interests. You can choose from the four specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology".

And of course you can also start a Master's programme. The specialisations of the Bachelor's programme are compiled and coordinated in such a way that you are optimally prepared for a further Master's programme and a seamless transition to subsequent Master's programmes at TU Hamburg is made possible.

The study programme "Green Technologies: Energy, Water, Climate" offers an engineering education in the energy-water-climate nexus that is unique in Germany. To this end, the study programme combines the competences of energy technology, process technology and sustainable supply and disposal engineering with natural science disciplines.

With the Bachelor's degree, you acquire your first academic degree that qualifies you for a profession and you become an engineer. You can already start your professional life.

Career prospects

The study programme Green Technologies: Energy, Water, Climate trains engineers for whom there will be a high demand today and in the future. The spectrum of employers ranges from engineering and planning offices, energy suppliers and water supply and disposal companies to industrial companies and public authorities, but also research institutions.

Learning target

The bachelor's degree programme Green Technologies: Energy, Water, Climate is designed to prepare students both for a professional activity and for a relevant consecutive master's degree programme. The basic methodological knowledge required for this is acquired during the study programme. The learning objectives of the degree programme are achieved through an interplay of basic and advanced modules from mechanical engineering, process engineering, hydraulic engineering and renewable energies.

Through the participation of professional engineers from industry in lectures, through experimental laboratory practicals and the exchange with lecturers from the University of Hamburg in the field of climate and meteorology, the students are able to develop a realistic relationship to the diverse professional field of climate, environmental, water and energy technology during their studies. This significantly increases the graduates' later career opportunities and enables them to help shape our world of tomorrow.

Graduates will be able to responsibly and competently perform an engineering job in various fields of activity in green and future-oriented technologies. In addition, they acquire the necessary scientific knowledge for a subsequent, in-depth Master's degree, which can be studied consecutively based on the chosen specialisation.

Knowledge

The knowledge acquired during the study programme enables graduates to understand the phenomena occurring in the subject areas of green technologies and related disciplines. They have understood the basic principles of climate, urban water management, conventional and renewable energy systems, with particular reference to sustainability and environmental protection. Knowledge is constituted by facts, principles and theories and is acquired in the Bachelor's degree programme Green Technologies in the following areas:

Graduates are able to reproduce basic knowledge in the scientific and engineering fields of mathematics, chemistry, mechanics, thermodynamics, fluid mechanics, computer science, electrical engineering, control engineering and heat and mass transfer.
 Graduates are able to outline and discuss fundamental methods and procedures for solving or approximating iterative decision and optimisation

- Graduates are able to outline and discuss fundamental methods and procedures for solving or approximating iterative decision and optimisation problems, such as differentiation, gradient-based procedures, testing hypotheses, as well as their analysis in terms of complexity, convergence and goodness.

- Through further specialised knowledge of the subject area (energy systems, water, bioresource technology or energy technology), they can further deepen their learned content with a focus on climate and environmental impact and develop procedures for solving environmental issues.

- Graduates are able to describe the construction, operation and organisation of conventional and regenerative energy plants and their components, including the control concepts used in the process. They are able to recognise the challenges of the energetically and economically optimised operation of energy plants, taking into account the additional criteria of resource conservation, sustainability, environmental compatibility and economic efficiency.

- Graduates will be able to investigate suitable technical alternatives in their professional life in order to minimise the environmental and social footprint of their engineering work and effectively support the energy transition.

- Graduates will be able to gain knowledge and skills beyond engineering for their profession through non-technical events.

Skills

The ability to apply learned knowledge to solve specific problems is supported in many ways in the Bachelor's degree programme Green Technologies: - Graduates are able to master relevant, specialised methods and tools, to assess their predictability and complexity and to implement them using suitable programming tools from current practice.

- Graduates are able to understand and further analyse climate processes, describe facilities and processes in the field of green technologies, balance energy systems and identify technical as well as economic relationships between conventional and renewable energy technologies.

- Graduates can identify and describe environmental impacts in general and develop control strategies of environmental pollution from industrial plants. This is also based on experience from related fields of measurement technology and process and environmental engineering.

- Graduates have the ability to identify the objectives of an engineering project, a green technology operation or society for a balanced and sustainable coverage of energy, water and resource needs and to responsibly prioritise in finding the optimal solution approach.

- Graduates are able to present the approach and results of their work in writing and explain them orally. They have mastered presentation techniques and have practised technical communication.

- Graduates are able to independently plan and conduct experiments and interpret the results.

- Graduates are able to apply measurement, control and regulation technology or constructive methods.

- Graduates have the ability to develop designs for processes, machines and apparatus according to specified requirements.

Social competence

Social competence includes the individual ability and willingness to work together with others in a goal-oriented manner, to understand the interests of others, to communicate and to help shape the working and living environment.

- Graduates can organise themselves in a professionally homogeneous team, work out a solution, take on specific subtasks and responsibly deliver partial results, and reflect on their own contribution.

- Graduates are able to discuss their scientific work results interactively and interdisciplinarily, to present them in front of the plenum and to defend them.

- Graduates are able to communicate about the contents and problems of energy and environmental technology with experts and laypersons.

Independence

Personal competences include not only the competence to act independently, but also to further develop one's own ability to act.

- Graduates can independently explore a narrowly defined sub-area of green technologies and summarise the results in detail in a presentation using common presentation techniques or in an essay of several pages. Critical analysis and not mere memorisation is required.
- Graduates are able to realistically assess their existing competences and work on deficits independently.
- Graduates are able to organise and carry out projects independently.
- Graduates are able to work independently on subject-specific sub-projects in a Bachelor's thesis using what they have learned during their studies.
- Graduates are able to independently obtain necessary information from suitable literature sources and to assess their quality.
- Graduates are able to evaluate technical problems in a larger social context and assess the non-technical effects of engineering activities.

Program structure

The curriculum of the Bachelor's degree programme Green Technologies: Energy, Water, Climate, which was designed as an undergraduate degree programme, consists mainly of compulsory courses. Elective options are provided for in the supplementary courses of the non-technical area.

In the first three semesters, the focus is on learning basic knowledge in the areas of mathematics, mechanics, chemistry, computer science, thermodynamics as well as meteorology and climate. Furthermore, the topics and applications of green technologies are taught in a module strand "Green Technologies" in the first, third and fifth semesters.

In the further course, the study programme is then expanded to include basic engineering subjects and the topics of regenerative energies as well as water supply and treatment. From the fourth semester onwards, you can choose a subject focus according to your personal interests. You can choose from the four specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology".

- Structure of the degree programme: - Mathematical-scientific basics (five modules)
- Fundamentals of engineering (ten modules)
- Green Technologies: Fundamentals of Climate and Environmental Engineering (three modules)
- Engineering Applications in Water and Energy (three modules).
- Electives in the specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology" (five modules)
- The following content from the non-technical area is added:
- One module on business administration
- Further supplementary courses from the non-technical compulsory elective catalogue (one module)

The scope of the Bachelor's programme in Energy and Environmental Engineering thus comprises 28 modules. These are divided into 26 subject modules and two non-technical supplementary modules. The programme is based on a broad mathematical-physical and scientific foundation. It also ensures that the theoretical basic knowledge is deepened and applied in the subjects of green technologies and engineering applications. In addition, the Bachelor's thesis is the module that concludes the degree programme.

Core Qualification

Graduates have acquired a basic knowledge of the natural sciences and engineering in the fields of mathematics, climate and meteorology, chemistry, mechanics and thermodynamics and materials science. It enables them to understand the phenomena occurring in energy technology, environmental technology and related disciplines. They have understood the basic principles of urban water management and conventional and renewable energy pulse transport processes, with particular reference to sustainability. They are familiar with measurement, control and regulation technology and design methods. Furthermore, the students have gained a comprehensive knowledge in the field of green technologies. Graduates are able to

- identify, abstract, formulate and holistically solve technical problems in a fundamentally oriented manner;

- penetrate, analyse and evaluate processes and methods of their discipline on a systems engineering basis;

- select and apply appropriate methods of analysis, modelling, simulation and optimisation;

- conduct literature research and use databases and other sources of information for their work;

- plan and conduct experiments independently and interpret the results;

- successfully complete a Master's degree in green technologies with in the field of process engineering, mechanical engineering or civil engineering. Graduates can responsibly and competently carry out an engineering activity in various fields of activity of climate, environmental and resource-saving technologies and and become the right to carry the professional title of "Engineer" along the lines of the engineering regulations of the German Federal Lands (IngG).

Knowledge	
Educational Objectives Professional Competence	After taking part successfully, students have reached the following learning results
-	The Non-technical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover full
	Self-reliance, self-management, collaboration and professional and personnel management competences. The department
	implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teachin areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence
	level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnic
	complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnic academic programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual development competences. It also provides orientation knowledge in the form of "profiles"
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one
	two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation
	study these subjects in one or two specific semesters during the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealin
	with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberate encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migratic studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semest 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goa private work.
	oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goa oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. The differences are reflected in the practical examples used, in content topics that refer to different professional application context and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadersh functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 locate selected specialized areas with the relevant non-technical mother discipline,
	 outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the location area
	learning area,different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
	sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation
	 in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
Skills	Can communicate in a roleign ranguage in a manner appropriate to the subject. Professional Competence (Skills)
	In selected sub-areas students can
	apply basic methods of the said scientific disciplines,
	 auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned speciali
	discipline,
	 to handle simple questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.
Personal Competence	
Social Competence	Personal Competences (Social Skills)
	Students will be able

-	 addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge. ersonal Competences (Self-reliance) tudents are able in selected areas to reflect on their own profession and professionalism in the context of real-life fields of application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)

Knowledge				
Educational Objectives	After taking part successfully, students have reach	ed the following learning results		
Professional Competence				
Knowledge				
	 Students can name further concepts in an . 	nalysis and linear algebra. They are abl	e to explain the	em using appropri-
	examples.			
	Students can discuss logical connections be	tween these concepts. They are capable	of illustrating th	ese connections w
	the help of examples.They know proof strategies and can reprodu	co thom		
	 They know proof strategies and can reprodu 	ce tien.		
Skills				
JKIIIS	 Students can model problems in analysis ar 	nd linear algebra with the help of the conc	epts studied in th	his course. Moreov
	they are capable of solving them by applying	g established methods.		
	 Students are able to discover and verify furt 	her logical connections between the conce	pts studied in the	e course.
	 For a given problem, the students can deviate 	velop and execute a suitable approach, a	nd are able to c	ritically evaluate
	results.			
Personal Competence				
Social Competence	 Students are able to work together in teams 	. They are capable to use mathematics as	a common langu	age.
	 In doing so, they can communicate new con 	cepts according to the needs of their coop	perating partners	. Moreover, they o
	design examples to check and deepen the u	nderstanding of their peers.		
Autonomy	 Students are capable of checking their under 	erstanding of complex concepts on their o	wn They can sn	ecify open questio
	precisely and know where to get help in solv		with they can sp	certy open question
	 Students have developed sufficient persister 	-	s in a goal-orien	ted manner on ha
	problems.

Тур	Lecture
Hrs/wk	4
СР	4
Workload in Hours	Independent Study Time 64, Study Time in Lecture 56
Lecturer	Prof. Nina Schützenmeister
Language	DE
Cycle	SoSe
Content	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic
	compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further,
	fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and
	aromatic substitution. Also modern reaction mechanisms will be described.

Cycle	SoSe
	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkanes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Technical Thermodynamics I (L043	7)	Lecture	2	4	
Technical Thermodynamics I (L043	9)	Recitation Section (large)	1	1	
Technical Thermodynamics I (L044	1)	Recitation Section (small)	1	1	
Module Responsible	Prof. Arne Speerforck				
Admission Requirements	None				
	Elementary knowledge in Mathematics an	nd Mechanics			
Knowledge					
Educational Objectives	After taking part successfully, students ha	ave reached the following learning results			
Professional Competence					
Knowledge	stadents are farminal with the laws of th	nermodynamics. They know the relation of the k			
	Thermodynamics and are aware about th	e limits of energy conversions according to 2 nd la	w of Thermodynar	nics. They are able	
	distinguish between state variables and	process variables and know the meaning of dif	ferent state variat	oles like temperatu	
	enthalpy, entropy and also the meaning	of exergy and anergy. They are able to draw	the Carnot cycle i	n a Thermodynam	
	related diagram. They know the physical	difference between an ideal and a real gas and	are able to use the	e related equations	
	state. They know the meaning of a fundar	mental state of equation and know the basics of t	wo phase Thermod	ynamics.	
Skills	Students are able to calculate the interna	al energy, the enthalpy, the kinetic and the poter	tial energy as well	as work and heat	
	simple change of states and to use this ca	alculations for the Carnot cycle. They are able to	alculate state vari	ables for an ideal	
	for a real gas from measured thermal stat	te variables.			
Personal Competence					
Social Competence	The students can discuss in small groups	and work out a solution. You can answer compreh	ension questions a	about the content (
	are provided in the lecture with the Clicke	erOnline tool "TurningPoint" after discussions with	other students.		
Autonomy	Chudents con understand the problems	oosed in tasks physically. They are able to select	the methode tous	ht in the lecture of	
Autonomy			the methods taug		
	exercise to solve problems and apply them independently to different types of tasks.

Module M1803: Engin	eering Mechanics II (Elastostati	cs)		
Courses				
Title		Тур	Hrs/wk	СР
Engineering Mechanics II (Elastosta	tics) (L0493)	Lecture	2	2
Engineering Mechanics II (Elastosta		Recitation Section (large)	2	2
Engineering Mechanics II (Elastosta	tics) (L0494)	Recitation Section (small)	2	2
Module Responsible	Prof. Christian Cyron			
Admission Requirements	None			
	Engineering Mechanics I, Mathematics I (basic knowledge of rigid body mechanics such as balance of linear and angula momentum, basic knowledge of linear algebra like vector-matrix calculus, basic knowledge of analysis such as differential ar integral calculus)			
Educational Objectives	After taking part successfully, students have re	eached the following learning results		
Professional Competence		-		
	Having accomplished this module, the students know and understand the basic concepts of continuum mechanics an elastostatics, in particular stress, strain, constitutive laws, stretching, bending, torsion, failure analysis, energy methods an stability of structures.			
SkillS	 Having accomplished this module, the students are able to apply the fundamental concepts of mathematical and mechanical modeling and analysis to problems of their choice apply the basic methods of elastostatics to problems of engineering, in particular in the design of mechanical structures to educate themselves about more advanced aspects of elastostatics 			
Personal Competence				
Social Competence	Ability to communicate complex problems in	elastostatics, to work out solution to these p	problems togethe	er with others, and
	communicate these solutions			
Autonomy	self-discipline and endurance in tackling inde knowledge	ependently complex challenges in elastostati	cs; ability to lea	irn also very abstra
Workload in Hours	Independent Study Time 96, Study Time in Leo	ture 84

Cycle	SoSe
	The lecture Engineering Mechanics II introduces the fundamental concepts of stress and strain and explains how these can be used to characterize and compute elastic deformations of mechanical bodies under loading. The focus of the lecture lies on: basis of continuum mechanics: stress, strain, constitutive laws truss torsion bar beam theory: bending, moment of inertia of area, transverse shear energy methods: Maxwell-Betti reciprocal work theorem, Castigliano's second theorem, theorem of Menabrea strength of materials: maximum principle stress criterion, yield criteria according to Tresca and von Mises stability of mechanical structures: Euler buckling strut

Technical Thermodynamics II (L044 Technical Thermodynamics II (L045		Lecture Recitation Section (large)	2 1	4 1
Technical Thermodynamics II (L045		Recitation Section (small)	1	1
Module Responsible				
Admission Requirements	None			
Recommended Previous	Elementary knowledge in Mathematics, Mechanics	and Technical Thermodynamics I		
Knowledge				
Educational Objectives	After taking part successfully, students have reach	ned the following learning results		
Professional Competence				
Knowledge	Students are familiar with different cycle processes like Joule, Otto, Diesel, Stirling, Seiliger and Clausius-Rankine. They are ab derive energetic and exergetic efficiencies and know the influence different factors. They know the difference between		-	
	clockwise and clockwise cycles (heat-power cycle,	, cooling cycle). They have increased know	ledge of steam c	ycles and are able
	draw the different cycles in Thermodynamics re			-
	processes and are able to perform simple combus		basic knowledge	in gas dynamics a
	know the definition of the speed of sound and kno	w about a Laval nozzle.		
Skills	Students are able to use thermodynamic laws for	the design of technical processes. Especia	lly they are able	to formulate ener
	exergy- and entropy balances and by this to optim	mise technical processes. They are able to	perform simple s	safety calculation
	regard to an outflowing gas from a tank. They	are able to transform a verbal formulat	ed message into	an abstract for
	procedure.			
Personal Competence				
Social Competence	The students are able to discuss in small groups	and develop an approach. You can answe	r comprehension	questions about
	content that are provided in the lecture with the C	lickerOnline tool "TurningPoint" after discu	ssions with other	students.
Autonomy	Students can physically understand and explain t	the complex problems (cycle processes, a	ir conditioning pr	ocesses, combust
	processes) set in tasks. They are able to select t	he methods taught in the lecture and exe	ercise to solve co	mplex problems a
	apply them independently to different types of tas	ks.

Content	In the Practical Course in Measurement Technology the theory from the lectures "Physical Fundamentals of Measurement Technology" and "Measurement Technology" will be applied in practice. In small groups students learn how to handle different measurement techniques from industry and research. During the practical course, a wide range of different measurement methods will be taught, including the use of HLPC columns for qualitative mass analysis, the determination of mass transfer coefficients using optical oxygen sensors or the evaluation of image data to obtain process parameters. The practical course also teaches how measurement data are statistically evaluated and experiments are correctly documented.

Content	Basic introduction to measurement technology for process engineers. Includes error calculation, measurement units, calibration, measurement data analysis, measurement techniques and sensors. Particular attention is paid to the measurement of temperature, pressure, flow and level. The lecture provides insights into the latest developments in sensor technology in measurement technology and process engineering.

Professional Competence	After taking part successionly, students have reached	the following learning results			
•	 With the completion of this modul the students obtain profound knowledge of environmental technology. They are able to desc With the completion of this modul the students obtain profound knowledge of environmental technology. They are able to desc the behaviour of chemicals in the environment. Students can give an overview of scientific disciplines involved. They can exp terms and allocate them to related methods. Additional students acquire in-depth knowledge of important cause-effect chains of potential environmental problems which m occur from production processes, projects or construction measures. They have knowledge about the methodological diversity are competent in dealing with different methods and instruments to assess environmental impacts. Besides the students are to estimate the complexity of these environmental processes as well as uncertainties and difficulties with their measurement. 				
Skills	determine geochemical parameters and to assess th	are able to propose appropriate management and mitigation measures for environmental problems. They are able to geochemical parameters and to assess the potential of pollutants to migrate and transform. The students are able to well founded opinions on how Environmental Technology contributes to sustainable development, and they can presend these opinons in front of and against the group.			
	The students are able to select a suitable method for the respective case from the variety of assessment methods. The can develop suitable solutions for managing and mitigating environmental problems in a business context. They are able out Life Cycle Impact Assessments independently and can apply the software programs OpenLCA and the database E After finishing the course the students have the competence to critically judge research results or other public environmental impacts.				
Personal Competence					
Social Competence	The students are able to discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They to develop different approaches to the task as a group as well as to discuss their theoretical or practical implementation. Due to the selected lecture topics, the students receive insights into the multi-layered issues of the environment protection concept of sustainability. Their sensitivity and consciousness towards these subjects are raised and which helps to ra awareness of their future social responsibilities in their role as engineers.				
Autonomy	The students learn to research, process and present a scientific topic independently. They are able to carry out independe scientific work. They can solve an environmental problem in a business context and are able to judge results of other publication

Content	The practical course Environmental Engineering currently consists of 5 experiments, which deal with the different focal points of environmental engineering in the areas of air, water, soil, energy and noise. The following experiments are carried out for this purpose: biological degradation of artificial materials, fine dust measurement in the air, water analysis, noise emission measurement, photovoltaic energy
	Within the lab course students discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They discuss different approaches to the task as well as it's theoretical or practical implementation.

Content	In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards.

	The lecture on drinking water supply provides students with a basic understanding of the entire water supply system, encompassing water catchment, water treatment including pump systems, water storage, and the distribution system that carries water to the consumer.
	Initially, basics in hydraulics and pump systems are presented (system curve and pump curve). Students learn how the duty point of the pump is determined. Students learn about different water resources and will be able to design groundwater wells. Students learn how to determine water demand and derive planning values for designing the different elements of a water supply system (e.g. firefighting requirements). The functions of reservoirs, their design and arrangement in the water supply system are explained. Students will be able to design simple water distribution systems.
1	A further part of the lecture deals with the processes involved in drinking water supply. This includes a presentation of the essential mechanisms and layout parameters for sedimentation, filtration, coagulation, membrane treatment, adsorption, water softening, gas exchange, ion exchange and disinfection. The basics of process treatment technology will be built on with parallel analysis of the impacts on chemical and physical water quality parameters.

Knowledge				
Educational Objectives	After taking part successfully, studen	ts have reached the following learning results		
Professional Competence				
Skills	 energy trade in this context, taking into account contexts bordering on other disciplines. The students can explain this knowled which is applicable to almost all energy systems, in particular detail for conventional energy systems and take a critical stance them. Furthermore, they can explain the environmental impact of using conventional energy systems. They also have an overvior of reserves and resources as well as global and national market volumes. This also includes the legal framework, which sho especially take into account the mitigation of climate change. Students are able to apply methodologies for determining energy demand or energy supply to different types of energy system Furthermore, they can evaluate energy systems technically, ecologically and economically as well as systemically and are a able to design them under certain given conditions. They are able to select the regulations necessary for this in a subject-spectiment, especially by means of non-standard solutions to a problem. Students are able to orally explain issues from the subject area and approaches to dealing with them and to classify them in respective context. 			
Personal Competence				
Social Competence	The students are able to analyze su	uitable technical alternatives and to assess them	with technical, econo	mical and ecolog
	criteria under sustainability aspects.

Cycle	SoSe
Content	This lecture addresses the mechanisms by which price formation works in global and national energy markets. For this purpose, the global price formation mechanism for crude oil and for natural gas and coal is explained. The national energy markets (e.g. power exchange, gas markets) are also discussed. The legal framework, which is ultimately decisive for market price formation, is always addressed. In this context, the various instruments with which the energy markets are to be influenced in such a way that climate protection already takes effect with market-based measures are also discussed. The expected future development/change of the energy markets against the background of the increasing use of renewable energies will also be addressed.

Language	DE
Cycle	SoSe
Content	The aim of this lecture is to present and discuss the different fossil energy systems in their entirety. This includes the petroleum, natural gas, hard coal, lignite and nuclear energy systems. In each case, the formation processes, the exploration technologies, the exploration processes, the extraction technologies, the further processing processes and the corresponding utilization are presented. In addition, the respective markets and their development, the existing reserves and resources, and the environmental effects associated with extraction and utilization are discussed. A total system approach is pursued, which includes a presentation of the entire energy system including the given interdependencies and (geo)political dependencies. The current changes in these energy systems for Germany and internationally, and those that are expected in the coming years, are also discussed. In addition, the respective reserve and resource availability is illuminated.

Content	This module includes a presentation of the renewable energy supply and a discussion of the respective technologies for providing the desired final or useful energy. Specifically, this includes the options for solar energy use for heat and power generation (i.e., passive solar energy use, solar collectors for low-temperature heat provision, solar thermal power generation, photovoltaic power generation), wind energy use for power generation (i.e. onshore and offshore wind power use), hydroelectric power use for electricity generation (i.e., run-of-river and storage hydroelectric power), ocean energy use for electricity generation (including tidal power plants), and geothermal energy use for heat and electricity generation (i.e., near-surface use by means of heat pumps, deep geothermal energy use for heat and/or electricity generation).

	This lecture covers all options for energy supply from biomass; this includes the supply of heat, electricity and fuels. The biomass resource and its origin will be discussed first. Afterwards the biomass supply is addressed, which bridges the gap between biomass generation and utilization. Subsequently, the different conversion options are discussed. Only those options are presented in depth that have a corresponding significance on the market in Germany and Europe. This includes (a) heat generation from biogenic solid fuels in small and large-scale plants (b) power generation from solid biomass via combustion (c) a biogas production from residues, by-products and waste, (d) alcohol production from sugar and starch (e) biodiesel production from vegetable oils. Special attention is also paid to the corresponding environmental aspects. An economic classification of the various options is also provided.

Knowledge				
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence				
Skills	environmental point of view; i.e. they will be able to systematize / analyze an intended / planned project on the basis of certain criteria and then, with the help of economic and environmental instruments, evaluate such planned projects on the basis of the specific provision costs and selected environmental parameters. Such an approach includes a basic knowledge in the field of economic calculations (e.g. static and dynamic methods) on the one hand and a basic understanding in relation to the preparation of a life cycle assessment / an eco balance on the other hand. In addition, there is the knowledge to implement these instruments for corresponding specific use cases through balance boundaries to be drawn independently by the students and to interpret the results accordingly. The students are able to apply the methods for an economic evaluation (e.g. annuity method) and for an environmental evaluation (e.g. life cycle assessment / eco balance) to different types of projects - and this related to various frame conditions. They will then be able to evaluate corresponding projects (including energy projects, chemical projects) in economic and environmental terms - and on the basis of this - in a systemic manner, and to make statements about the corresponding economic and environmental limitations. Additionally, students are able to orally explain issues from the subject area, approaches to dealing with them, and place them in their respective context.			
Personal Competence				
Social Competence	Students are able to investigate suitable technical projects and ultimately evaluate them based on economic and environmenta evaluation criteria - and thus finally under a wide range of sustainability aspects.			
Autonomy	Students will be able to independently access various sources about the field, acquire knowledge, and transform it to address new issues.

Specialization Biotechnologies

In the specialisation "Bioresource Technology", process engineering and biotechnological contents and competences are combined in a comprehensive subject area. The students gain a deeper understanding of the interactions and interfaces between bioresources and process engineering for the establishment of a sustainable bioeconomy.

	The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and fellow students. The students work small groups with a high degree of division of labor. For every experiment, the students write a report. They receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they car increase their capabilities in this area. Topics of the practical course: Introduction in the thermal process engineering and to the main features of separation processes Simple equilibrium processes, several steps processes Distillation of binary mixtures, enthalpy-concentration diagrams Extractive and azeotrope distillation, water vapor distillation, stepwise distillation Extraction: separation ternary systems, ternary diagram Multiphase separation including complex mixtures Designing of separation devices without discrete stages Drying Chromatographic separation processes Membrane separation Energy demand of separation processes

Cycle	SoSe				
Content	Performing and evaluation of experiments concerning chemical reaction engineering with emphasis on ideal reactors:				
	* Batch reactor - Estimation of kinetic parameters for the saponification of ethylacetate				
	*CSTR - Residence time distribution, reaction				
	*CSTR in Series - Residence time distribution, reaction				
	^c Plug Flow Reactor - Residence time distribution, reaction				
	Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice.				
	The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Knowledge					
Educational Objectives	After taking part successfully, students have	e reached the following learning results			
Professional Competence					
Knowledge	The students, based on a literature survey, learn to study in detail a subject theme from the disciplines of green technologies an deliver afterwards a summary presentation to a specialised audience. Environmental issues and their multidisciplinary linkages ar preferred, when selecting the thematic area of these studies. Through their own written contribution the students communicate a overview over the subject and practice technical writing. With the discussion the students practice scientific debating on specialised subject matter.				
Skills	The students can, when working on a techni conduct a literature survey choose the relevant information for th prepare a written summary present results in front of peers and s correctly cite and reference sources.	heir presentation			
	The students practice a critical assessment of the literature in a predefined specialised theme and learn to give presentations their own technical sub-topic tailored to their public and discuss with the audience. When attending technical presentations, students can formulate questions to other speakers and participate in the ensuing discussion. The fulfilment of the tasks combines independent work with group and teamwork. The students can, guided by instructors, critically reflect on their learning and work status, and write a scientific report.

Content	Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes).

Cycle Content	 The seminar offers an introduction into the diverse aspects of academic research and writing: Finding the topic, finding specinformation, knowledge organisation, writing, presenting and publishing. Suggestions for reflecting own processes of learning and writing - in addition to practical recommendations and tips - facilitate the start and the creation of bachel master theses, works, which bring thoroughly self-fulfillment and make fun. Topics of the seminar will be in particular Scientific scholarship and academic research methods: Introduction, organization, attributes of science: How is scientific knowledge created? Work scheduling, finding topics, time management, specialities of academic research in engineering Finding specialized information: Full texts and library resources, databases http://www.tub.tuhh.de/en/sriinformation/informing-points-to-survive/ Reference management: http://www.tub.tuhh.de/en/publishing/reference-management/Knowledge organisation and creating publications with Citavi Citing correctly and avoiding plagiarism Preparing and doing presentations

Admission Requirements	Prof. Johannes Gescher					
Recommended Previous	The module is divided into two parts. In the winter					
Knowledge	knowledge is required for this lecture. In the following summer semester, the second part of the module is offered. This is div into an internship and an introductory lecture. For these two parts of the module, attendance of the lecture in the winter seme is strongly recommended.					
Educational Objectives	After taking part successfully, students have reache	ed the following learning results				
Professional Competence						
Knowledge	The module aims to teach you the basic principl constructed and what basic characteristics can be about the ways in which biological systems can pro addition, you will learn how enzymes are constru- enzymes exert their effect.	used to distinguish organisms from oduce energy and you will apply the p	the three kingdoms principles of biologica	of life. You will lea I thermodynamics.		
	At the end of the module					
	 you will be able to describe basic principles of living systems and explain the metabolism of organisms by applying them. you will be able to assign organisms to the three kingdoms of life based on some basic characteristics 					
	- you will be able to describe the tasks of enzymes generically on the basis of some example reactions					
	- you will be able to deduce from the basic characteristics of organisms and enzymes which biotechnological applications a possible with these systems.					
	- you can understand and use the technical vocabulary of biological systems and processes					
	- you will be able to perform simple bioinformatic operations to assign DNA sequences to a function					
	- you can confidently apply the basic principles of using primary literature					
Skills	The students master the basic techniques of sterile work and molecular diagnostics. They can independently prepare media maintain microorganisms in culture. In addition, they can isolate and characterize organisms from enrichment cultures environmental samples.					
Personal Competence						
Social Competence	The students are able,					
	- to gather knowledge in groups of about 2 to 10 students					
	- to introduce their own knowledge and to argue the	eir view in discussions in teams				
	- to divide a complex task into subtasks, solve these	e and to present the combined results	5			
Autonomy	Students are able to independently structure their internship days and prioritize tasks. Furthermore, they are able to collect a process basic information on microorganisms via a literature search.

Cycle	WiSe				
Content	In the lecture we will learn the basic characteristics of organisms of all kingdoms of life. This includes cell biology as well as cell physiology. We understand the energetic foundations of living systems and the variety of possible metabolic concepts of life. From these basic laws we will understand how and to what extent an application and genetic reprogramming of organisms for application can take place.

Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Phase Equilibria Thermodynamics (Lecture	2	2	
Phase Equilibria Thermodynamics (Recitation Section (small)	1	2	
Phase Equilibria Thermodynamics (Recitation Section (large)	1	2	
Module Responsible	Prof. Irina Smirnova				
Admission Requirements	None				
Recommended Previous	Mathematics, Physical Chemistry, Thermodynam	ics I and II			
Knowledge					
Educational Objectives	After taking part successfully, students have read	ched the following learning results			
Professional Competence					
Knowledge					
	 Starting from the very basics of thermod 	ynamics, the students learn the mathemati	cal tools to deso	cribe thermodyna	
	equilibria.				
	 They learn how state variables are influe 	nced by the mixing of compounds and lear	n concepts to qu	antitatively desc	
	these properties.				
	 Moreover, the students learn how phase 			-	
		ist in equilibrium. Furthermore the fundamen			
	 For different phase equilibria, several ex 	amples relevant for different kinds of proc	esses are show	n and the necess	
	knowledge for plotting and interpreting the	e equilibria are taught.			
Skills					
	 Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibrium 				
	state and know how to simplify these equations meaningfully.				
	The students know models which can be used to determine the properties of the system in the equilibrium state and t				
	are able to solve the resulting mathematic	al relations.			
	 For specific applications, they are able to 	self-reliantly find necessary physico-chemica	I properties of c	ompounds as wel	
	model parameters in literature sources.				
	Beside pure compound properties the students are capable of describing the properties of mixtures.				
	The students know how to visualize phase equilibria graphically and they know how to interpret the occurring phenomena				
	 Based on their knowledge, the students 	n their knowledge, the students are able to understand fundamental concepts that are the basis for ma			
	separation and reaction processes in chemical engineering.				
Personal Competence					
Social Competence	The students are able to work in small groups, t	to solve the corresponding problems and to	present them or	aly to the tutors	
	other students				
Autonomy					
, (accricing)	 The students are able to find necessary inf 	formation self-reliantly in literature sources a	nd to judge their	quality.	
	 During the semester the students are a 	ble to check their learning progress conti	nuously in exer	cises. Based on	
	knowledge the students can adept their le	arning process.

Course L0886: Genetics and	Molecular Biology
Тур	Lecture
Hrs/wk	2
CP	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Johannes Gescher
Language	DE
Cycle	WiSe/SoSe
Content	- Organisation, structure and function of procaryotic DNA
	- DNA replication, transcription, translation
	- Regulation of gene expression
	- Mechanisms of gene transfer, recombination, transposition
	- Mutatuion and DNA repair
	- DNA cloning
	- DNA sequencing
	- Polymerase chain reaction
	- Genome sequencing, (meta)genomics, transcriptomics, proteomics
Literature	Rolf Knippers, Molekulare Genetik, Georg Thieme Verlag Stuttgart
	Munk, K. (ed.), Genetik , 2010, Thieme Verlag
	John Ringo, Genetik kompakt, 2006, Elsevier GmbH, München

Hrs/wk	
CP	
	Independent Study Time 48, Study Time in Lecture 42
	Prof. Johannes Gescher
Language	DE
Cycle	WiSe/SoSe
Content	Widespread techniques of microbiological, biochemical and genetic approaches will be taught during this course.
	Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice.
	The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.
	Topics and Methods of the course include:
	- Morphology and growth of different bacteria strains
	- Measuring of microbial growth by turbidity
	- Preparation of several culture media
	- Strain identification by gram staining and analytical profile index (API test)
	- Genetic background identification by 16S rRNA analysis
	- Microscopy
	- BLAST analyses
	- Colony PCR procedure
	- Enzyme activity measurements and kinetics (Michaelis-Menten equation, Lineweaver-Burk plot)
	- Enzymes as biocatalysts (exemplarily use of enzymes in detergents)
	- Measurement of protein concentrations (Bradford protein assay)
	- Qualitative and quantitative enzyme activity assay
Literature	Brock Mikrobiologie / Brock Microbiology (Michael T. Madigan, John M. Martinko)
	Mikrobiologisches Grundpraktikum (Steve K. Alexander, Dennis Strete)

Regulatory aspects of biological ag		Lecture	2	3		
	Prof. Anna-Lena Heins					
Admission Requirements						
	1. Experience in the general operation	of industrial chemical and bioprocesses				
Knowledge	2. Knowledge of biological relationship	s and substance groups				
	3. Experience with the handling of haz	ardous substances, which has been acquired in	laboratory experiments			
Educational Objectives	After taking part successfully, students	s have reached the following learning results				
Professional Competence						
Knowledge	After successfully participating in the o	course "Regulatory Aspects of Biological Agents"	", students can			
	- explain the legal framework for biote	chnological and chemical work,				
	- Illustrate excerpts from e.g. the Act	on the Implementation of Measures of Occup	ational Safety and Heal	th, Biological Age		
	Ordinance, Infection Protection Act, G	erman Chemicals Act, Hazardous Substances C	Ordinance, Genetic Engin	eering Act Stem (
	Act, and Embryo Protection Act,					
	- Assign genetic engineering work and equipment in biotechnological genetic laboratories according to the security level,					
	- Assign current Good Manufacturing Practice (cGMP) with reference to the EU-GMP guidelines as well as internation					
	and guidelines for biopharmaceuticals (ICH guidelines).					
Skills	Students will be able to evaluate biot framework.	echnological work with not modified and genet	ically modified organism	s based on the le		
Personal Competence						
		dent assessment of legal issues, especially in th	ne biotechnological field.			
Autonomy	Students will be able to responsibly all	ign and perform their own work with knowledge	of the legal situation and	d assist colleagues		
	assessing the legal situation.

Cycle	SoSe
Content	This lecture deals with the legal framework of biotechnological and chemical work. On the basis of the acts and ordinacesto be considered (e.g. Occupational Health and Safety Act, Biological Substances Ordinance, Genetic Engineering Act, etc.), the legal frameworks are explained. In addition, requirements for safety classifications of genetic engineering work and the equipment of laboratories for genetic engineering work genetic are presented. Furthermore, national and international requirements for drug production with industrial reference are discussed.
Literature	Die zum Zeitpunkt der Vorlesung gültigen Gesetze werden in der Vorlesung dargestellt und bekanntgegeben.

Knowledge	statents should be familiar with the busies of molecular biology	and genetics, and hav	re knowledge of fillerook		
J.	In addition, prior knowledge of DNA sequencing technologies an	d the phylogenetic tre	e of life is advantageous	. Also helpful is sor	
	experience with command line based computer input.				
Educational Objectives	After taking part successfully, students have reached the follow	ing learning results			
Professional Competence					
Knowledge	During the course, students gain knowledge of different app	olication areas of DNA	A sequencing technolog	ies, the potential	
	previously uncharacterized microbial metabolic pathways, how	life forms differ in the	metabolism of microbes	s, and the benefits	
	the growth of microbial communities.				
Skills	By the end of the seminar, participants will be familiar with the				
	large data sets. Specifically, applications for analyzing sequencing data will be practiced, as well as interpretation fo				
	characterizing microbial systems.				
	Topics covered in the course:				
	- Genome sequencing on a MinION				
	- De novo genome assembly				
	- Metagenome analyses				
	- Functional and taxonomic annotation of gene sequences				
	- Construction of phylogenetic trees				
	- Representation of metabolic pathways				
	- Genome mining				
	- Protein structure analyses				
Personal Competence					
Social Competence		of the used parameters	, methods and intermed	diate results must b	
	chosen for communication in the group.				
Autonomy	Students will be able to summarize their findings from the comp	pleted subtasks in a rep	port.

Admission Requirements							
Recommended Previous Knowledge	Process engineering fundamentals, in particular unit operations in mechanical and thermal process engineering and chemic reaction engineering						
Educational Objectives	After taking part successfully, students have reached	the following learning results					
Professional Competence							
Knowledge	Students are able to						
	- classify and formulate global balance equations and	linear material balance models for proce	ess engineering s	ystems			
	- understand and apply system concepts						
	- explain and apply strategies for the synthesis of read	ctors in the synthesis of separation syste	ems				
	- understand PINCH analyses						
	- specify static and dynamic methods of cost and prof	itability calculation					
	- Specify static and dynamic methods of cost and profitability calculation						
Skills	Students are enabled to						
	- prepare mass and energy balances of processes and calculate the flows						
	 - calculate mass flows in complex process engineering plants with the aid of linear material balance models - solve balance equalization problems 						
	- perform structured process synthesis for reactors						
	- perform structured process synthesis for separation	Systems					
	- Carry out PINCH analyses						
	- make quantitative statements about manufacturing costs and the economic efficiency of production processes						
Personal Competence							
Social Competence	Students are able to develop solutions together in het	erogeneous small groups					
Autonomv	Students are enabled to acquire knowledge independ	ently on the basis of further literature

Specialization Energy Systems / Renewable Energies

The specialisation "Energy Systems" aims to provide students with an in-depth understanding of the fundamental content in (regenerative) energy systems; this also applies to future-oriented (energy) technologies. The focus is on the interactions of new processes of climate-friendly energy supply and integration of renewable energies with the fundamentals of process, energy and environmental technology. In this specialisation, students acquire competences in the area of "green" technologies as part of a future-oriented and thus sustainable energy system.

Course L1159: Separation Pr	ocesses
Тур	Practical Course
Hrs/wk	1
CP	1
Workload in Hours	Independent Study Time 16, Study Time in Lecture 14
Lecturer	Prof. Irina Smirnova
Language	DE/EN
Cycle	WiSe
Content	The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and fellow students. The students work small groups with a high degree of division of labor. For every experiment, the students write a report. They receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they car increase their capabilities in this area. Topics of the practical course: Introduction in the thermal process engineering and to the main features of separation processes Simple equilibrium processes, several steps processes
	 Distillation of binary mixtures, enthalpy-concentration diagrams Extractive and azeotrope distillation, water vapor distillation, stepwise distillation Extraction: separation ternary systems, ternary diagram Multiphase separation including complex mixtures Designing of separation devices without discrete stages Drying Chromatographic separation processes Membrane separation processes Advance overview of separation processes Selection of separation processes

Content	Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes).

Content	Course Content:
	This course provides a comprehensive introduction to the fundamentals of human-induced climate change. Important concepts such as the Earth's radiation budget, the greenhouse effect, and the various Earth system components (e.g., atmosphere, hydrosphere, cryosphere, biosphere) related to climate change are explained. Fundamentals of climate modeling and climate scenarios are explained. Findings from the Intergovernmental Panel on Climate Change's Assessment Reports are provided in relation to observed and model-based physical climate change and their impacts on various Earth system components Furthermore, the impacts of global and regional climate change on society (e.g., agriculture, infrastructure, energy) will be highlighted and especially the changes and impacts of weather and climate extremes will be discussed. In the last part of the lecture, current global and national climate change targets will be explained and discussed in the context of possible scenarios options and challenges to reduce global warming. Concepts such as "net-zero" emissions and negative emissions will be addressed with important implications for the development of new technologies. Learning Objective: Basic knowledge of human-induced climate change, and how to model climate change, and its impacts on different sectors of the environment and society, and the options and consequences for different sectors to achieve the targeted climate goals (reduction of global awarming). Structure: Introduction Climate Change/Climate Change Reports. The climate system Observed climate change Climate wariability Climate models

Content	Lecturers: MK, Dr. Ben Norden (GFZ), Dr. Conny Schmidt-Hattenberger (GFZ)
	Lecture Content: The goal of this lecture is to address and present technical measures to mitigate climate change. This primarily includes the immediate means by which climate gas emissions can be reduced when they have already occurred. Specifically, the lecture includes the following content:
	- Overview of the main greenhouse gases emitted, including their global warming potential and the average lifetime of the molecules in the atmosphere.
	- Avoidance Methane (CH ₄) (point sources).
	o Emission sources: Methane slip, methane emission from combustion, etc.
	o Reduction methane slip (including gas extraction, biogas plants, waste management).
	o Reduction of methane from combustion (e.g. power plants, ship engines, car engines, CHP engines, etc.)
	o Reduction of other sources if necessary
	- Avoidance Nitrous oxide (N ₂ O) (point sources).
	o Emission sources: Combustion processes, production processes, biological nitrogen oxidation, etc.
	o Reduction of combustion processes
	o Reduction of production processes
	o Reduction of biological nitrogen oxidation
	o Reduction of further sources, if necessary
	- Avoidance of other greenhouse gases (including F-gases) (point sources)
	- Avoidance of carbon dioxide from fossil carbon (point sources)
	o Emission sources: Combustion processes, production processes
	o Capture technologies from exhaust gases
	- Capture carbon dioxide from diffuse sources (ambient air)
	- Temporary storage and transport of carbon dioxide
	- Final storage of carbon dioxide
	o Geological framework and storage options, infrastructure (assessment) o Surface installations / modes of operation / conditioning of CO ₂ (phase behavior) etc.
	o Thermodynamic framework and interactions
	o Tightness of the storage complex (geomechanics) and long-term behavior (modeling), saltwater displacement and upwelling?
	o Monitoring concepts (monitoring methods from geophysics, geochemistry, microbiology, applied on different spatial and temporal scales) and assessment of storage safety
	o Modeling (static, dynamic, chemical, scale-dependent - borehole, reservoir, energy system modeling).
	o Retrievability (interim storage) and after-use concepts (synthetic fuels)?, backfilling (cements, etc.).
	o Examples

Phase Equilibria Thermodynamics (L0114)	Lecture	2	2
Phase Equilibria Thermodynamics (Recitation Section (small)	1	2
Phase Equilibria Thermodynamics (Recitation Section (large)	1	2
Module Responsible	Prof. Irina Smirnova			
Admission Requirements	None			
Recommended Previous	Mathematics, Physical Chemistry, Thermodynam	ics I and II		
Knowledge				
Educational Objectives	After taking part successfully, students have read	ched the following learning results		
Professional Competence				
Knowledge				
	 Starting from the very basics of thermody 	lynamics, the students learn the mathemat	cal tools to deso	cribe thermodyna
	equilibria.			
	 They learn how state variables are influe 	nced by the mixing of compounds and lear	n concepts to qu	uantitatively desc
	these properties.			
	 Moreover, the students learn how phase 			-
		ist in equilibrium. Furthermore the fundamen		
	 For different phase equilibria, several ex 	amples relevant for different kinds of proc	esses are shown	n and the necess
	knowledge for plotting and interpreting th	e equilibria are taught.		
Skills				
	 Applying their knowledge, the students a 	re able to identify the correct equation for	the determination	on of the equilibr
	state and know how to simplify these equations meaningfully.			
	• The students know models which can be used to determine the properties of the system in the equilibrium state and the			
	are able to solve the resulting mathematic	cal relations.		
	 For specific applications, they are able to 	self-reliantly find necessary physico-chemica	al properties of c	ompounds as wel
	model parameters in literature sources.			
	Beside pure compound properties the students are capable of describing the properties of mixtures.			
	 The students know how to visualize phase 	equilibria graphically and they know how to	interpret the occ	urring phenomen
	 Based on their knowledge, the students 	s are able to understand fundamental con	ncepts that are	the basis for m
	separation and reaction processes in chen	nical engineering.		
Personal Competence				
Social Competence	The students are able to work in small groups,	to solve the corresponding problems and to	present them or	raly to the tutors
	other students			
Autonomy				
, (accricing)	 The students are able to find necessary in 	formation self-reliantly in literature sources a	nd to judge their	r quality.
	 During the semester the students are a 	able to check their learning progress conti	nuously in exer	cises. Based on
	knowledge the students can adept their le	arning process.

In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Specialization Energy Technology

The aim of the specialisation "Energy Technology" is to enable students to plan and calculate plants and machines and to familiarise them with various technologies for energy conversion, energy distribution and energy application. Processes can be analysed, abstracted and modelled using scientific methods. Students can assess data and results and use them to develop strategies for innovative solutions.

Content	Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes).

Title	Typ Hrs/wk CP		
Numerical Mathematics I (L0417)	Lecture 2 3		
Numerical Mathematics I (L0418)	Recitation Section (small) 2 3		
Module Responsible	Prof. Sabine Le Borne		
Admission Requirements	None		
Recommended Previous	 Mathematik I + II for Engineering Students (german or english) or Analysis & Linear Algebra I + II for Technomathematici 		
Knowledge	basic MATLAB/Python knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge	Students are able to		
	name numerical methods for interpolation, integration, least squares problems, eigenvalue problems, nonlinear root find		
	 name numerical methods for interpolation, megration, least squares problems, eigenvalue problems, nonimear root interpolation, problems and to explain their core ideas, 		
	 repeat convergence statements for the numerical methods, 		
	 explain aspects for the practical execution of numerical methods with respect to computational and storage complexitx. 		
Skills	Students are able to		
SKIIIS			
	 implement, apply and compare numerical methods using MATLAB/Python, 		
	 justify the convergence behaviour of numerical methods with respect to the problem and solution algorithm, 		
	 select and execute a suitable solution approach for a given problem. 		
Personal Competence			
	Students are able to		
,			
	 work together in heterogeneously composed teams (i.e., teams from different study programs and background knowledge explain theoretical foundations and support each other with practical aspects regarding the implementation of algorithms 		
Autonomy	Students are capable		
	• to assess whether the supporting theoretical and practical excercises are better solved individually or in a team,		
	 to assess their individual progess and, if necessary, to ask questions and seek help. 		
	Independent Study Time 124, Study Time in Lecture 56

Workload in Hours	Independent Study Time 108, Study Time in Lecture 42
Lecturer	Dr. Lars Wiese, Dr. Stylianos Rafailidis
Language	DE
Cycle	WiSe
Content	In the 1 st part of the lecture an overview on thermal power plants is offered, including:
	- Electricity demand and Expectition
	Electricity demand and Forecasting Thermodynamic fundamentals
	Energy Conversion in thermal power plants
	Types of power plant
	Layout of the power plant block
	Individual elements of the power plant
	Cooling systems
	Flue gas cleaning
	Operation characteristics of the power plant
	Construction materials for power plants
	Location of power plants
	Solar thermal plants/geothermal plants/Carbon Capture and Storage plants.
	These are complemented in the 2 nd part of the module by the more specialised issues:
	Energy balance of a turbomachine
	Theory of turbine and compressor stage
	Equal and positive pressure blading
	Flow losses
	Characteristic numbers
	Axial and radial design
	Design features
	Hydraulic turbomachines
	Pump and water turbine designs
	Design examples of reciprocating engines and turbomachinery
	Steam power plants
	Gas turbine systems.

	Individual elements of the power plant
	Cooling systems
	Flue gas cleaning
	Operation characteristics of the power plant
	Construction materials
	Location of power plants
	The environmental impact of acidification, fine particulate or CO ₂ emissions and the resulting climatic effects are a special focus
	the lecture and the lecture hall exercise. The challenges in plant operation from interconnecting conventional power plants a
	renewable energy sources are discussed and the technical options for providing security of supply and network stability a presented, also under consideration of cost effectiveness. In this critical review, focus is especially placed on the compatibility the different solutions with the environment and climate. With this, the awareness for the responsibility of an engineer's or actions are emphasized and the potential extent of the different solutions presented clearly.
	Within the framework of the exercise the students learn the use of the specialised software suite EBSILON Professional TM . With tool small tasks are solved on the PC, to highlight aspects of the design and development of power plant cycles. The stude
	present their results orally and can afterwards ask questions and get feedback. The course work has a positive effect on students final grade.

Production Engineering I (L0608)		Lecture	2	2	
Production Engineering I (L0612)					
Production Engineering II (L0610)		Lecture	2	2	
Production Engineering II (L0611)		Recitation Section (large)	1	1	
Module Responsible	Prof. Jan Hendrik Dege				
Admission Requirements	None				
Recommended Previous	no course assessments required				
Knowledge	internship recommended				
Educational Objectives	After taking part successfully, students have rea	ached the following learning results			
Professional Competence					
Knowledge	Students are able to				
	 name basic criteria for the selection of ma 	anufacturing processes.			
	 name the main groups of Manufacturing ⁻ 	Fechnology.			
	 name the application areas of different m 	anufacturing processes.			
		vantages of the different manufacturing proce	SS		
		and kinematic variables and requirements for		and process	
			cools, workpiece	and process.	
	 explain the essential models of manufact 	uning technology.			
Skills	Students are able to				
	 select manufacturing processes in accord 	ance with the requirements.			
		le tasks to meet the required tolerances of th	e component to b	ne produced	
	 assess components in terms of their prod 			produced.	
	• ussess components in terms of their prod	denon-oriented construction.			
Demonstration of the second					
Personal Competence					
Social Competence	Students are able to				
	 develop solutions in a production environ 	ment with qualified personnel at technical lev	el and renresent	decisions	
			er und represent	accisions.	
A	Chudenha ana akia ha				
Autonomy	Students are able to				
	 interpret independently the manufacturin 	a process.			
	 assess own strengths and weaknesses in 				
	 assess their learning progress and define 				
	 assess possible consequences of their ac 	tions.

Title		Тур	Hrs/wk	СР
Electrical Machines and Actuators (10293)	Lecture	3	4
Electrical Machines and Actuators (Recitation Section (large)	2	2
Module Responsible				
•	None			
	Basics of mathematics, in particular complexe n	umbers, integrals, differentials		
Knowledge	Basics of electrical engineering and mechanical	engineering		
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence	·····,, ····,			
-	Students can to draw and explain the basis prin	riplac of electric and magnetic fields		
Knowledge	Students can to draw and explain the basic prine	liples of electric and magnetic fields.		
	They can describe the function of the stand			
	characteristic curves. For typically used drives the	ley can explain the major parameters of the	energy eniciency	or the whole syste
	from the power grid to the driven engine.			
Skills	Students are able to calculate two-dimensional	electric and magnetic fields in particular fe	rromagnetic circ	uits with air gap. F
	this they apply the usual methods of the design		5	5 1
	They can calulate the operational performance	of electric machines from their given chara	cteristic data an	d selected quantiti
	and characteristic curves. They apply the usual	equivalent circuits and graphical methods.		
Personal Competence				
Social Competence	none			
	Students are able independently to calculate ele	ectric and magnatic fields for applications. Th	nev are able to a	nalvse indenenden
Autonomy	the operational performance of electric machin			
	and characteristic curves.			
	and characteristic curves.

182: Management Tutorial
Recitation Section (small)
2
3
Independent Study Time 62, Study Time in Lecture 28
Prof. Christian Lüthje
DE
WiSe/SoSe
In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Cycle	W126/3026
content	 Introduction to Business and Management, Business versus Economics, relevant areas in Business and Management
	 Important definitions from Management,
	 Developing Objectives for Business, and their relation to important Business functions
	Business Functions: Functions of the Value Chain, e.g. Production and Procurement, Supply Chain Management, Innovation
	Management, Marketing and Sales
	Cross-sectional Functions, e.g. Organisation, Human Ressource Management, Supply Chain Management, Information
	Management
	 Definitions as information, information systems, aspects of data security and strategic information systems Definition and Relevance of innovations, e.g. innovation opporunities, risks etc.
	 Definition and Relevance of Innovations, e.g. innovation opportunities, risks etc. Relevance of marketing, B2B vs. B2C-Marketing
	 different techniques from the field of marketing (e.g. scenario technique), pricing strategies
	important organizational structures
	basics of human ressource management
	 Introduction to Business Planning and the steps of a planning process
	Decision Analysis: Elements of decision problems and methods for solving decision problems
	Selected Planning Tasks, e.g. Investment and Financial Decisions
	 Introduction to Accounting: Accounting, Balance-Sheets, Costing
	Relevance of Controlling and selected Controlling methods
	Important aspects of Entrepreneurship projects

Courses					
Title		Тур		Hrs/wk	СР
Fundamentals of Ship Structural De	esign (L0411)	Lecture		2	2
Fundamentals of Ship Structural De	esign (L0413)	Recitation Section	n (small)	1	2
Fundamentals of Ship Structural Ar		Lecture		2	2
Fundamentals of Ship Structural Ar	nalysis (L0414)	Recitation Section	n (small)	1	2
Module Responsible	Prof. Sören Ehlers				
Admission Requirements	None				
Recommended Previous	Mechanics I - III				
Knowledge	Fundamentals of Materials Science I - III				
	Welding Technology I				
	Fundamentals of Mechanical Design I - III				
Educational Objectives	After taking part successfully, students have reached t	he following learning resul	ts		
Professional Competence					
Knowledge	Students can reproduce the basic contents of the strue	tural behaviour of ship str	uctures; they ca	n explain the	theory and methods
	for the calculation of deformations and stresses in bea	m-like structures.			
	Furthermore they can reproduce the basic contants	f and an (mulan) materials	aansi finishad r	veducte isini	na and aviaciales of
	Furthermore, they can reproduce the basis contents	or codes (rules), materials,	semi-finisned p	products, joini	ng and principles of
	structural design of components in the ship structure.				
Skills	Students are capable of applying the methods and			ations and st	resses in the above
	mentioned structures; they can choose calculation mo	dels of typical ship structur	es.		
	Furthermore, they are capable to apply the methods	of drawing and sizing the s	ship structure; t	hey can selec	t suitable materials,
	semi-finished products and joints.			-	
Personal Competence					
Social Competence	The students are able to communicate and cooperat	e in a professional enviror	nment in the sh	ipbuilding an	d component supply
···· ,·· ,··	industry.			1	
Autonomy	The students are capable to independently idealize re	eal ship structures and to	select suitable i	methods for a	nalysis of beam-like
	structures; they are capable to assess the results of st	ructural analyses.			
	Furthermore, they are capable to assess drawings	of complex ship structu	ires and to de	sian ship str	uctures for various
	requirements and boundary conditions.

f	phase transformations, corrosion and mechanical properties. The students know about the key aspects of characterization met for materials and can identify relevant approaches for characterizing specific properties. They are able to trace mate phenomena back to the underlying physical and chemical laws of nature.			
ם ה לו	The students are able to trace materials phenomena back to the underlying physical and chemical laws of nature. Materia phenomena here refers to mechanical properties such as strength, ductility, and stiffness, chemical properties such as corrosio resistance, and to phase transformations such as solidification, precipitation, or melting. The students can explain the relatic between processing conditions and the materials microstructure, and they can account for the impact of microstructure on the material's behavior.

Cycle	SoSe
Content	1. Numerical Integration, Diffrentation, Interpolation
	- Trapezoidal Rule, Simpson, Tschebyscheff, graphical Integration Methods
	- Determination of Areas, 1st and 2nd order Moments
	- Numerical Diffrentation, Spline Interpolation
	2. Buyoancy
	- Principle of Archimedes
	- Equiibrium Floating Condition
	- Equlibrium Computations
	- Hydrostatic Tables and Sounding Tables
	- Trim Tables
	[147]

3. Stability at large heeling angles
- Stability Equation
- Cross Curves of Stability and Righting Levers
- Numerical and Graphical Determination of Cross Curves
- Heeling Moments of Free Surfaces, Water on Deck, Water Ingress
- Heeling Moments of Different Type
- Balance of Heeling and Righting Moments acc. to BV 1030
- Intact Stability Code (General Critaria)
4. Linearization of Stability Problems
- Linearization of Restoring Forces and Moments
- Correlation between Metacentric Height and Righting Lever at small heeling angles
- Computation of Path of Metacentric Height for Modern Hull Forms
- Correlation between Righting Lever and Path of Metacentric Height
- Hydrostatic Stiffness Matrix
- Definition of MCT
- Computation of Equilibrum Floating Conditions from Hydrostatic Tables
- Effect of Free Surfaces on Initial GM
- Roll Motions at Small Roll Angles
6. Stability in Waves
- Roll Motions at Large Amplitudes
- Pure Loss of Stability on the Wave Crest
- Principle of Parametric Excitation
- Principle of Direct Wave Moments
- Grim´s Equivalent Wave Concept
6 Longitudinal Strength
- Longitudinal Mass Distribution, Shear Forces, Bending Moments
- Longitudinal Strength in Stability Booklet
7. Deadweight Survey and Inclining Experiment
- Deplacement Computations from Draft mark Readings
- Weights to go on /come from board
- Inclining Experiment with Heeling Moments from Weights and Heeling Tanks
- Residual Sounding Volumes
- Determination of COG from Metacentric height and from Cross Curves
- Roll Decay Test
8. Launching and Docking
- Launching Plan, Arrangement of Launching Blocks
- Rigid Body Launching: Tilting, Dumping, Equation of Techel
- Computation of Launching Event
- Bottom Pressure and Longitudinal Strength
- Linear- Elastic Effects
- Transversal Stability on Slipway and in Dock
9. Grounding
- Loss of Buoynacy when Grounded
- Pointwise Grounding
- Ship Grounds on Keel
10. Introduction into Damage Stability Problems

- Added Mass Method
- Loss of Buoyant Volume Method

- Simple Equilibrium Computations	
- Intermediate Stages of Flooding (Addes Mass Method), Cross- and Downflooding	
- Water Ingress Through Openings	
11. Special Problems (optional and agreed upon)	
- e.g. Heavy Lift Operations	
- e.g. Jacking of Jackup Vessels	
- e.g. Sinking After Water Ingress

Content	As preparation for the lecture "Hydrostatics", the students must develop a body plan of a modern twin screw vessel (cruise liner, RoPAx- feryy, RoRo) and perform elementary volumetric computations. The body plan is to be developed from a given GA or can be designed freely. All computations shall be based on graphical integration methods. The body plan consists of : - Grid - approx. 20 sections, 5 Waterlines, 5 Buttocks - Computation Volume and centre of buoyancy for several drafts - Computation of Righting Lever curve for a given displacement based on and graphical integration for several heeling angles.

Content	Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes).

Content	The seminar offers an introduction into the diverse aspects of academic research and writing: Finding the topic, finding special information, knowledge organisation, writing, presenting and publishing. Suggestions for reflecting own processes of leal informing and writing - in addition to practical recommendations and tips - facilitate the start and the creation of bachelo master theses, works, which bring thoroughly self-fulfillment and make fun. Topics of the seminar will be in particular • Scientific scholarship and academic research methods: • Introduction, organization, attributes of science: How is scientific knowledge created? Work scheduling, finding topics, time management, specialities of academic research in engineering • Finding specialized information: Full texts and library resources, databases http://www.tub.tuhh.de/en/sul information/informing-points-to-survive/ • Reference management: http://www.tub.tuhh.de/en/publishing/reference-management/ Knowledge organisation and creating publications with Citavi • Citing correctly and avoiding plagiarism
	Preparing and doing presentations

Course L0293: Electrical Mac	hines and Actuators
Тур	Lecture
Hrs/wk	3
СР	4
Workload in Hours	Independent Study Time 78, Study Time in Lecture 42
Lecturer	Prof. Thorsten Kern, Dennis Kähler
Language	DE
Cycle	SoSe
Content	Electric field: Coulomb's law, flux (field) line, work, potential, capacitor, energy, force, capacitive actuators
	Magnetic field: force, flux line, Ampere's law, field at bounderies, flux, magnetic circuit, hysteresis, induction, self-induction, mutual inductance, transformer, electromagnetic actuators Synchronous machines, construction and layout, equivalent single line diagrams, no-load and short-cuircuit characteristics, vector diagrams, motor and generator operation, stepper motors DC-Machines: Construction and layout, torque generation mechanismen, torque vs speed characteristics, commutation, Asynchronous Machines. Magnetic field, construction and layout, equivalent single line diagram, complex stator current diagram (Heylands'diagram), torque vs. speed characteristics, rotor layout (squirrel-cage vs. sliprings),
	Drives with variable speed, inverter fed operation, special drives

Fundamentals of Mechanical Engine	eering Design (L0258)	Lecture	2	3
Fundamentals of Mechanical Engine	eering Design (L0259)	Recitation Section (large)	2	3
Module Responsible	Prof. Dieter Krause			
Admission Requirements	None			
Recommended Previous	 Basic knowledge about mechanics a 	and production opgingering		
Knowledge	 Internship (Stage I Practical) 	and production engineering		
	• Internation (Stuge Friderical)			
Educational Objectives	After taking part successfully, students ha	ve reached the following learning results		
Professional Competence				
Knowledge	After passing the module, students are ab	le to:		
	explain basic working principles and	functions of machine elements		
		eria, application scenarios and practical exam	oles of basic machi	ne elements. indic
	the background of dimensioning cal			
Skills	After passing the module, students are ab	le to:		
	accomplish dimensioning calculatio	ns of covered machine elements,		
	• transfer knowledge learned in the n	nodule to new requirements and tasks (problem	solving skills),	
	 recognize the content of technical of 	rawings and schematic sketches,		
	 technically evaluate basic designs. 			
Personal Competence				
Social Competence				
oolar competence	 Students are able to discuss technic 	al information in the lecture supported by activ	ating methods.	
Autonomy				
, aconomy	 Students are able to independently deepen their acquired knowledge in exercises. 			
	• Students are able to acquire additional knowledge and to recapitulate poorly understood content e.g. by using the vide			
	recordings of the lectures.			
Workload in Hours	Independent Study Time 124, Study Time	in Lecture 56		
Credit points	6			
Course achievement	None			
Examination	Written exam			
Examination duration and	120 min

182: Management Tutorial
Recitation Section (small)
2
3
Independent Study Time 62, Study Time in Lecture 28
Prof. Christian Lüthje
DE
WiSe/SoSe
In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Specialization Water Technologies

In the specialisation "Water", process engineering, construction and environmental science contents and competences are combined in a comprehensive water-specific subject area. Students gain a deeper understanding of the interactions and interfaces between urban water management and ecosystems as well as water and energy management.

Knowledge						
Educational Objectives A	fter taking part suc	cessfully, students hav	ve reached the following le	earning results		
Professional Competence						
Knowledge S	Students can define generic material interactions between the environmental media. The can demonstrate their knowledge ab					
r	natural as well as anthropogenic materials. They are capable of explaining the natural condition of waters and other					
e	environmental media.					
Skills S	Skills Students are able to research environment-specific aspects of civil engineering independent. They can					resent their findir
using accredited academic media (e.g. posters) and can give a short summary including sci					c references.	
Personal Competence						
	itudents can fulfil a	complex environment-	related assignment in the	e field of civil engineering by	working in a t	eam.
			5	5 5 ,	j i	
Autonomy I	ndividual students p	prepare aspects of the g	given group work indepen	ndently.

Workload in Hours	Independent Study Time 92, Study Time in Lecture 28
Lecturer	Dozenten des Studiengangs
Language	DE
Cycle	WiSe
Content	Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes).

Content	The seminar ""Infrastructure Management Wastewater"" develops the understanding of infrastructure systems in relation to wastewater systems, but also addresses other infrastructure systems.
	Initially, an overview of the entire system is given, including water catchment areas, water distribution, the origin of wastewater in households and industry, stormwater runoff management, and the treatment and reuse of water (constituents). Thereby the design tools especially of digital modelling are understood by practical application. Energetic considerations as well as planning and restoration of pipeline systems are covered.
	For wastewater treatment, the basis developed in Sanitary Engineering I will be deepened and significantly expanded, especially the resource recovery of nutrients and water. Sanitary solutions for different socio-economic and climatic conditions are understood and calculated.

Content	The seminar deepens and expands the knowledge of the processes of drinking water treatment. The seminar deals with ion exchange, oxidation, disinfection, gas exchange and hybrid treatment processes. Further topics include pH adjustment and energy efficiency in water supply. Within the scope of the course, the students work out a seminar performance (presentation, design, modelling) on the basis of a task.

Course L08	Course L0882: Management Tutorial					
Тур	Recitation Section (small)					
Hrs/wk	2					
СР	3					
Workload	Independent Study Time 62, Study Time in Lecture 28					
in Hours						
Lecturer	Prof. Christian Lüthje					
Language	DE					
Cycle	WiSe/SoSe					
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.					
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Title	Typ Hrs/wk CP
Module Responsible Admission Requirements	Professoren der TUHH
Aumssion Requirements	According to General Regulations §21 (1):
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives Professional Competence	After taking part successfully, students have reached the following learning results
Knowledge	
	 The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods).
	• On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of
	opening up and establishing links with extended specialized expertise.The students are able to outline the state of research on a selected issue in their subject area.
	• The students are able to outline the state of research on a selected issue in their subject area.
Skills	• The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve
	subject-related problems.
	 With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.
	• The students can take up a critical position on the findings of their own research work from a specialized perspective.
Personal Competence	
Social Competence	Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and
	in a structured way.
	• The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the
	addressees. In doing so they can uphold their own assessments and viewpoints convincingly.
Autonomy	• The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a
	specified time frame.
	• The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem
	problem.The students can apply the essential techniques of scientific work to research of their own.
