Program description

Content

Climate change, high energy and resource consumption, disruption of ecosystems and a steadily growing world population are the challenges that humanity is already facing today. What the world of tomorrow will look like thus depends decisively on what solutions we find in dealing with these developments.

The degree programme "Green Technologies: Energy, Water, Climate" addresses precisely these issues. By combining specialist knowledge with technical and communication skills, we train engineers who think in an interdisciplinary and solution-oriented way. The focus is on "green" technologies for a sustainable, climate and resource-friendly energy and water supply.

In the first three semesters, the focus is on learning the basics of mathematics, mechanics, chemistry, computer science, thermodynamics as well as meteorology and climate. In the further course, the study programme is then expanded to include basic engineering subjects and the topics of regenerative energies as well as water supply and treatment. From the fourth semester onwards, you can choose a subject focus according to your personal interests. You can choose from the four specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology".

And of course you can also start a Master's programme. The specialisations of the Bachelor's programme are compiled and coordinated in such a way that you are optimally prepared for a further Master's programme and a seamless transition to subsequent Master's programmes at TU Hamburg is made possible.

The study programme "Green Technologies: Energy, Water, Climate" offers an engineering education in the energy-water-climate nexus that is unique in Germany. To this end, the study programme combines the competences of energy technology, process technology and sustainable supply and disposal engineering with natural science disciplines.

With the Bachelor's degree, you acquire your first academic degree that qualifies you for a profession and you become an engineer. You can already start your professional life.

In addition to the foundational curriculum taught at TUHH, seminars on developing personal skills are integrated into the dual study programme, in the context of transfer between theory and practice. These seminars correspond to the modern professional requirements expected of an engineer, as well as promoting the link between the two places of learning.

The intensive dual courses at TUHH integrating practical experience consist of an academic-oriented and a practice-oriented element, which are completed at two places of learning. The academic-oriented element comprises study at TUHH. The practice-oriented element is coordinated with the study programme in terms of content and time, and consists of practical modules and phases spent in an affiliate company during periods when there are no lectures.

Career prospects

The study programme Green Technologies: Energy, Water, Climate trains engineers for whom there will be a high demand today and in the future. The spectrum of employers ranges from engineering and planning offices, energy suppliers and water supply and disposal companies to industrial companies and public authorities, but also research institutions.

In addition, students acquire basic professional and personal skills as part of the dual study programme that enable them to enter professional practice at an early stage and to go on to further study. Students also gain practical work experience through the integrated practical modules. Graduates of the dual course have broad foundational knowledge, fundamental skills for academic work and relevant personal competences.

Learning target

The bachelor's degree programme Green Technologies: Energy, Water, Climate is designed to prepare students both for a professional activity and for a relevant consecutive master's degree programme. The basic methodological knowledge required for this is acquired during the study programme. The learning objectives of the degree programme are achieved through an interplay of basic and advanced modules from mechanical engineering, process engineering, hydraulic engineering and renewable energies.

Through the participation of professional engineers from industry in lectures, through experimental laboratory practicals and the exchange with lecturers from the University of Hamburg in the field of climate and meteorology, the students are able to develop a realistic relationship to the diverse professional field of climate, environmental, water and energy technology during their studies. This significantly increases the graduates' later career opportunities and enables them to help shape our world of tomorrow.

Graduates will be able to responsibly and competently perform an engineering job in various fields of activity in green and future-oriented technologies. In addition, they acquire the necessary scientific knowledge for a subsequent, in-depth Master's degree, which can be studied consecutively based on the chosen specialisation.

Knowledge

The knowledge acquired during the study programme enables graduates to understand the phenomena occurring in the subject areas of green technologies and related disciplines. They have understood the basic principles of climate, urban water management, conventional and renewable energy systems, with particular reference to sustainability and environmental protection. Knowledge is constituted by facts, principles and theories and is acquired in the Bachelor's degree programme Green Technologies in the following areas:

- is acquired in the Bachelor's degree programme Green Technologies in the following areas:
 Graduates are able to reproduce basic knowledge in the scientific and engineering fields of mathematics, chemistry, mechanics, thermodynamics, fluid mechanics, computer science, electrical engineering, control engineering and heat and mass transfer.
- Graduates are able to outline and discuss fundamental methods and procedures for solving or approximating iterative decision and optimisation problems, such as differentiation, gradient-based procedures, testing hypotheses, as well as their analysis in terms of complexity, convergence and goodness.
- Through further specialised knowledge of the subject area (energy systems, water, bioresource technology or energy technology), they can further deepen their learned content with a focus on climate and environmental impact and develop procedures for solving environmental issues.
- Graduates are able to describe the construction, operation and organisation of conventional and regenerative energy plants and their components, including the control concepts used in the process. They are able to recognise the challenges of the energetically and economically optimised operation of energy plants, taking into account the additional criteria of resource conservation, sustainability, environmental compatibility and economic efficiency.
- Graduates will be able to investigate suitable technical alternatives in their professional life in order to minimise the environmental and social footprint of their engineering work and effectively support the energy transition.
- Graduates will be able to gain knowledge and skills beyond engineering for their profession through non-technical events.

Skills

The ability to apply learned knowledge to solve specific problems is supported in many ways in the Bachelor's degree programme Green Technologies:

- Graduates are able to master relevant, specialised methods and tools, to assess their predictability and complexity and to implement them using suitable programming tools from current practice.
- Graduates are able to understand and further analyse climate processes, describe facilities and processes in the field of green technologies, balance energy systems and identify technical as well as economic relationships between conventional and renewable energy technologies.
- Graduates can identify and describe environmental impacts in general and develop control strategies of environmental pollution from industrial plants. This is also based on experience from related fields of measurement technology and process and environmental engineering.
- Graduates have the ability to identify the objectives of an engineering project, a green technology operation or society for a balanced and sustainable coverage of energy, water and resource needs and to responsibly prioritise in finding the optimal solution approach.

- Graduates are able to present the approach and results of their work in writing and explain them orally. They have mastered presentation techniques and have practised technical communication.
- Graduates are able to independently plan and conduct experiments and interpret the results.
- Graduates are able to apply measurement, control and regulation technology or constructive methods.
- Graduates have the ability to develop designs for processes, machines and apparatus according to specified requirements.

Social competence

Social competence includes the individual ability and willingness to work together with others in a goal-oriented manner, to understand the interests of others, to communicate and to help shape the working and living environment.

- Graduates can organise themselves in a professionally homogeneous team, work out a solution, take on specific subtasks and responsibly deliver partial results, and reflect on their own contribution.
- Graduates are able to discuss their scientific work results interactively and interdisciplinarily, to present them in front of the plenum and to defend them.
- Graduates are able to communicate about the contents and problems of energy and environmental technology with experts and laypersons.

Personal competences include not only the competence to act independently, but also to further develop one's own ability to act.

- Graduates can independently explore a narrowly defined sub-area of green technologies and summarise the results in detail in a presentation using common presentation techniques or in an essay of several pages. Critical analysis and not mere memorisation is required.
- Graduates are able to realistically assess their existing competences and work on deficits independently.
- Graduates are able to organise and carry out projects independently.
- Graduates are able to work independently on subject-specific sub-projects in a Bachelor's thesis using what they have learned during their studies.
- Graduates are able to independently obtain necessary information from suitable literature sources and to assess their quality.
- Graduates are able to evaluate technical problems in a larger social context and assess the non-technical effects of engineering activities

By continually switching places of learnings throughout the dual study programme, it is possible for theory and practice to be interlinked. Students reflect theoretically on their individual professional practical experience, and apply the results of their reflection to new forms of practice. They also test theoretical elements of the course in a practical setting, and use their findings as a stimulus for theoretical debate.

Program structure

The curriculum of the Bachelor's degree programme Green Technologies: Energy, Water, Climate, which was designed as an undergraduate degree programme, consists mainly of compulsory courses. Elective options are provided for in the supplementary courses of the non-technical area.

In the first three semesters, the focus is on learning basic knowledge in the areas of mathematics, mechanics, chemistry, computer science, thermodynamics as well as meteorology and climate. Furthermore, the topics and applications of green technologies are taught in a module strand "Green Technologies" in the first, third and fifth semesters.

In the further course, the study programme is then expanded to include basic engineering subjects and the topics of regenerative energies as well as water supply and treatment. From the fourth semester onwards, you can choose a subject focus according to your personal interests. You can choose from the four specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology".

Structure of the degree programme:

- Mathematical-scientific basics (five modules)
- Fundamentals of engineering (ten modules)
- Green Technologies: Fundamentals of Climate and Environmental Engineering (three modules)
- Engineering Applications in Water and Energy (three modules).
- Electives in the specialisations "Energy Systems", "Water", "Bioresource Technology" or "Energy Technology" (five modules)
- The following content from the non-technical area is added:
- One module on business administration
- Further supplementary courses from the non-technical compulsory elective catalogue (one module)

The scope of the Bachelor's programme in Energy and Environmental Engineering thus comprises 28 modules. These are divided into 26 subject modules and two non-technical supplementary modules. The programme is based on a broad mathematical-physical and scientific foundation. It also ensures that the theoretical basic knowledge is deepened and applied in the subjects of green technologies and engineering applications. In addition, the Bachelor's thesis is the module that concludes the degree programme.

The structural model of the dual study programme follows a module-differentiating approach. Given the practice-oriented element, the curriculum of the dual study programme is different compared to a standard Bachelor's course. Five practical modules are completed at the dual students' partner company as part of corresponding practical terms during lecture-free periods.

Core Qualification

Graduates have acquired a basic knowledge of the natural sciences and engineering in the fields of mathematics, climate and meteorology, chemistry, mechanics and thermodynamics and materials science. It enables them to understand the phenomena occurring in energy technology, environmental technology and related disciplines. They have understood the basic principles of urban water management and conventional and renewable energy pulse transport processes, with particular reference to sustainability. They are familiar with measurement, control and regulation technology and design methods. Furthermore, the students have gained a comprehensive knowledge in the field of green technologies.

Graduates are able to

- identify, abstract, formulate and holistically solve technical problems in a fundamentally oriented manner;
- penetrate, analyse and evaluate processes and methods of their discipline on a systems engineering basis;
- select and apply appropriate methods of analysis, modelling, simulation and optimisation;
- conduct literature research and use databases and other sources of information for their work;
- plan and conduct experiments independently and interpret the results;
- successfully complete a Master's degree in green technologies with in the field of process engineering, mechanical engineering or civil engineering.

Graduates can responsibly and competently carry out an engineering activity in various fields of activity of climate, environmental and resource-saving technologies and and become the right to carry the professional title of "Engineer" along the lines of the engineering regulations of the German Federal Lands (IngG).

| Educational Objectives | After taking part successfully, students have re | ached the following learning results | | | | |
| Professional Competence | | | | | | |
| | Sstudents are able to handle molecular orbital theory including the octahedral ligand field, qualitatively describe the resulting electron density distribution and structures of molecules (VSEPR); they have developed an idea of molecular interactions in the gas, liquid and solid phases. They are able to describe chemical reactions in the sense of retention of mass and energy, enthalpy and entropy as well as the chemical equilibrium. They can explain the concept of activation energy in conjucture with particle kinetic energy. They have increased knowledge of acid-base concepts, acid-base reactions in water, can perform pH calculations, understand titration as a quantitative analysis. They can recognize redox processes, correlate redox potentials to Gibbs energy, handle Nernst theory in describing the concentration dependence of redox potentials, known the concept of overpotential and understand corrosion as a redox reaction (local element). Students are able to use general and inorganic chemistry for the design of technical processes. Especially they are able to formulate mass and energy balances and by this to optimise technical processes. They are able to perform simple calculations of pH values in regard to an application of acids and bases, and evaluate the course of redox processes (calculation of redoxpotentials). They are able to transform a verbal formulated message into an abstract formal procedure. Students are able to | | | | | |
| Personal Competence | present and discuss their scientific results in plenum. The students are able to document the results of their experiments scientifically. They are able to use scientific citation methods in their reports. | | | | | |
| Social Competence | The students are able to discuss given tasks in | small groups and to develop an approach. | | | | |
| | Students are able to carry out experiments in small groups in lab scale and to distribute tasks in the group independently. | | | | | |
| Autonomy | Students are able to define independently tasks, to get new knowledge from existing knowledge as well as to find ways to use the knowledge in practice. | | | | | |
| | Students are able to apply their knowledge to plan, prepare and conduct experiments. Students are able to independently judge their own knowledge and to acquire missing knowledge that is required to fulfill their tasks. | | | | | |

| Content | This laboratory course comprises the following four topics, i) atomic structure and application of spectroscopic methods, introduction of analytic methods ii) chemical reactions (qualitative analysis), bonding types, reaction types, reaction equations iii) acid-base concepts, acid-base reactions in water, buffer solution, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, galvanic elements and electrolysis. Prior to every experiement, a seminar takes place in small groups (12-15 students). The students participate orally. Team work and cooperation are forwarded because the experiments in the lab and the writing of the reports is conducted in groups of three or four students. Additionally, acedemic writing conveyed (documentation of experiment results in lab journals, literature citations in reports). |

| Title | | Тур | Hrs/wk | СР |
| Organic Chemistry (L0831) | | Lecture | 4 | 4 |
| Organic Chemistry (L0832) | | Practical Course | 3 | 2 |
| Module Responsible | Prof. Ralph Holl | | | |
| Admission Requirements | None | | | |
| Recommended Previous | High School Chemistry and/or lecture "general and | inorganic chemistry" | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reache | ed the following learning results | | |
| Professional Competence | | | | |
| Knowledge | Students are familiar with basic concepts of organic chemistry. They are able to classify organic molecules and to identify functional groups and to describe the respective synthesis routes. Fundamental reaction mechanisms like nucleophilic substitution, eliminations, additions and aromatic substitution can be described. Students are capable to describe in general modern reaction mechanisms. | | | |
| Skills | Students are able to use basics of organic chemistry for the design of technical processes. Especially they are able to formulate basic routes to synthesize small organic molecules and by this to optimise technical processes in Process Engineering. They are able to transform a verbally formulated message into an abstract formal procedure. The students are able to document and interpret their working process and results scientifically. | | | |
| Personal Competence | | | | |
| Social Competence | The students are able to discuss in small groups and | d develop an approach for given tasks. | | |
| Autonomy | Students are able to get new knowledge from existi | ng knowledge as well as to find ways to | o use the knowledge | in practice. |

| Content | The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic |
| | compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, |
| | fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and |
| | aromatic substitution. Also modern reaction mechanisms will be described. |

| Content | The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course. | | |

| | The lecture Engineering Mechanics II introduces the fundamental concepts of stress and strain and explains how these can be used to characterize and compute elastic deformations of mechanical bodies under loading. The focus of the lecture lies on: • basis of continuum mechanics: stress, strain, constitutive laws • truss • torsion bar • beam theory: bending, moment of inertia of area, transverse shear • energy methods: Maxwell-Betti reciprocal work theorem, Castigliano's second theorem, theorem of Menabrea • strength of materials: maximum principle stress criterion, yield criteria according to Tresca and von Mises • stability of mechanical structures: Euler buckling strut | |

| Content | In the Practical Course in Measurement Technology the theory from the lectures "Physical Fundamentals of Measurement Technology" and "Measurement Technology" will be applied in practice. In small groups students learn how to handle different measurement techniques from industry and research. During the practical course, a wide range of different measurement methods will be taught, including the use of HLPC columns for qualitative mass analysis, the determination of mass transfer coefficients using optical oxygen sensors or the evaluation of image data to obtain process parameters. The practical course also teaches how measurement data are statistically evaluated and experiments are correctly documented. |

| Content | Basic introduction to measurement technology for process engineers. Includes error calculation, measurement units, calibration, measurement data analysis, measurement techniques and sensors. Particular attention is paid to the measurement of temperature, pressure, flow and level. The lecture provides insights into the latest developments in sensor technology in measurement technology and process engineering. |

| Module Responsible | Dr. Marvin Scherzinger | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Fundamentals of inorganic/organic chemistry and biology. | | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reached the fo | ollowing learning results | | |
| Professional Competence | | | | |
| Knowledge | With the completion of this modul the students obtain profethe behaviour of chemicals in the environment. Students | | | |
| Skills | Additional students acquire in-depth knowledge of important cause-effect chains of potential environmental problems which might occur from production processes, projects or construction measures. They have knowledge about the methodological diversity and are competent in dealing with different methods and instruments to assess environmental impacts. Besides the students are able to estimate the complexity of these environmental processes as well as uncertainties and difficulties with their measurement. Students are able to propose appropriate management and mitigation measures for environmental problems. They are able to determine geochemical parameters and to assess the potential of pollutants to migrate and transform. The students are able to work out well founded opinions on how Environmental Technology contributes to sustainable development, and they can present and defend these opinons in front of and against the group. The students are able to select a suitable method for the respective case from the variety of assessment methods. Thereby they can develop suitable solutions for managing and mitigating environmental problems in a business context. They are able to carry out Life Cycle Impact Assessments independently and can apply the software programs OpenLCA and the database Ecolnvent. After finishing the course the students have the competence to critically judge research results or other publications on | | | |
| Personal Competence Social Competence | The students are able to discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They are able to develop different approaches to the task as a group as well as to discuss their theoretical or practical implementation. Due to the selected lecture topics, the students receive insights into the multi-layered issues of the environment protection and the concept of sustainability. Their sensitivity and consciousness towards these subjects are raised and which helps to raise their awareness of their future social responsibilities in their role as engineers. | | | |
| Autonomy | The students learn to research, process and present a scientific topic independently. They are able to carry out independent scientific work. They can solve an environmental problem in a business context and are able to judge results of other publications. | | | |

| Content | The practical course Environmental Engineering currently consists of 5 experiments, which deal with the different focal points of |
| | environmental engineering in the areas of air, water, soil, energy and noise. The following experiments are carried out for this |
| | purpose: |
| | biological degradation of artificial materials, |
| | fine dust measurement in the air, |
| | water analysis, |
| | noise emission measurement, |
| | photovoltaic energy |
| | |
| | Within the lab course students discuss the various technical and scientific tasks, both subject-specific and multidisciplinary. They |
| | discuss different approaches to the task as well as it's theoretical or practical implementation. |

| Content | In the group exercise, the contents of the lecture are taken up and deepened by means of exercises. The exercise tasks correspond in quality and scope to the tasks of the written exam. Topics: Reynolds transport-theorem, pipe flow, free jet, angular momentum, Navier-Stokes equations, potential theory, mock exam, pipe hydraulics, pump design. |

| Content | In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards. |

| Content | The lecture on drinking water supply provides students with a basic understanding of the entire water supply system, encompassing water catchment, water treatment including pump systems, water storage, and the distribution system that carries water to the consumer. | |
| | Initially, basics in hydraulics and pump systems are presented (system curve and pump curve). Students learn how the duty point of the pump is determined. Students learn about different water resources and will be able to design groundwater wells. Students learn how to determine water demand and derive planning values for designing the different elements of a water supply system (e.g. firefighting requirements). The functions of reservoirs, their design and arrangement in the water supply system are explained. Students will be able to design simple water distribution systems. | |
| | A further part of the lecture deals with the processes involved in drinking water supply. This includes a presentation of the essential mechanisms and layout parameters for sedimentation, filtration, coagulation, membrane treatment, adsorption, water softening, gas exchange, ion exchange and disinfection. The basics of process treatment technology will be built on with parallel analysis of the impacts on chemical and physical water quality parameters. | |

| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have | e reached the following learning results | | |
| Professional Competence | | | | |
| Skills | Upon completion of this module, students will be able to provide an overview of characteristics of energy systems. They can explain the issues that arise. Furthermore, they are able to explain knowledge of energy production, energy distribution and energy trade in this context, taking into account contexts bordering on other disciplines. The students can explain this knowledge, which is applicable to almost all energy systems, in particular detail for conventional energy systems and take a critical stance on them. Furthermore, they can explain the environmental impact of using conventional energy systems. They also have an overview of reserves and resources as well as global and national market volumes. This also includes the legal framework, which should especially take into account the mitigation of climate change. Students are able to apply methodologies for determining energy demand or energy supply to different types of energy systems. Furthermore, they can evaluate energy systems technically, ecologically and economically as well as systemically and are also able to design them under certain given conditions. They are able to select the regulations necessary for this in a subject-specific manner, especially by means of non-standard solutions to a problem. Students are able to orally explain issues from the subject area and approaches to dealing with them and to classify them in the respective context. | | | |
| Personal Competence | | | | |
| Social Competence | The students are able to analyze suitable criteria under sustainability aspects. | technical alternatives and to assess ther | m with technical, econor | nical and ecological |
| Autonomy | Students can independently exploit sources , acquire the particular knowledge about the subject area and transform it to new questions. | | | |

| Content | This lecture addresses the mechanisms by which price formation works in global and national energy markets. For this purpose, the global price formation mechanism for crude oil and for natural gas and coal is explained. The national energy markets (e.g. power exchange, gas markets) are also discussed. The legal framework, which is ultimately decisive for market price formation, is always addressed. In this context, the various instruments with which the energy markets are to be influenced in such a way that climate protection already takes effect with market-based measures are also discussed. The expected future development/change of the energy markets against the background of the increasing use of renewable energies will also be addressed. |

| Content | The aim of this lecture is to present and discuss the different fossil energy systems in their entirety. This includes the petroleum, natural gas, hard coal, lignite and nuclear energy systems. In each case, the formation processes, the exploration technologies, the exploration processes, the extraction technologies, the further processing processes and the corresponding utilization are presented. In addition, the respective markets and their development, the existing reserves and resources, and the environmental effects associated with extraction and utilization are discussed. A total system approach is pursued, which includes a presentation of the entire energy system including the given interdependencies and (geo)political dependencies. The current changes in these energy systems for Germany and internationally, and those that are expected in the coming years, are also discussed. In addition, the respective reserve and resource availability is illuminated. |

| Content | This module includes a presentation of the renewable energy supply and a discussion of the respective technologies for providing the desired final or useful energy. Specifically, this includes the options for solar energy use for heat and power generation (i.e., passive solar energy use, solar collectors for low-temperature heat provision, solar thermal power generation, photovoltaic power generation), wind energy use for power generation (i.e. onshore and offshore wind power use), hydroelectric power use for electricity generation (i.e., run-of-river and storage hydroelectric power), ocean energy use for electricity generation (including tidal power plants), and geothermal energy use for heat and electricity generation (i.e., near-surface use by means of heat pumps, deep geothermal energy use for heat and/or electricity generation). |

| Content | This lecture covers all options for energy supply from biomass; this includes the supply of heat, electricity and fuels. The biomass resource and its origin will be discussed first. Afterwards the biomass supply is addressed, which bridges the gap between biomass generation and utilization. Subsequently, the different conversion options are discussed. Only those options are presented in depth that have a corresponding significance on the market in Germany and Europe. This includes (a) heat generation from biogenic solid fuels in small and large-scale plants (b) power generation from solid biomass via combustion (c) a biogas production from residues, by-products and waste, (d) alcohol production from sugar and starch (e) biodiesel production from vegetable oils. Special attention is also paid to the corresponding environmental aspects. An economic classification of the various options is also provided. |

| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reached the | ne following learning results | | |
| Professional Competence | | | | |
| | On completion of this module, students will be able to analyze and evaluate projects / project ideas from an economic and environmental point of view; i.e. they will be able to systematize / analyze an intended / planned project on the basis of certain criteria and then, with the help of economic and environmental instruments, evaluate such planned projects on the basis of the specific provision costs and selected environmental parameters. Such an approach includes a basic knowledge in the field of economic calculations (e.g. static and dynamic methods) on the one hand and a basic understanding in relation to the preparation of a life cycle assessment / an eco balance on the other hand. In addition, there is the knowledge to implement these instruments for corresponding specific use cases through balance boundaries to be drawn independently by the students and to interpret the results accordingly. The students are able to apply the methods for an economic evaluation (e.g. annuity method) and for an environmental evaluation (e.g. life cycle assessment / eco balance) to different types of projects - and this related to various frame conditions. They will then be able to evaluate corresponding projects (including energy projects, chemical projects) in economic and environmental terms - and on the basis of this - in a systemic manner, and to make statements about the corresponding economic and environmental limitations. Additionally, students are able to orally explain issues from the subject area, approaches to dealing with them, and place them in their respective context. | | | |
| · | Students are able to investigate suitable technical pro evaluation criteria - and thus finally under a wide range | of sustainability aspects. | | |
| Autonomy | Students will be able to independently access various sissues. | sources about the field, acquire knowl | edge, and transfo | orm it to address new |

Specialization Biotechnologies

In the specialisation "Bioresource Technology", process engineering and biotechnological contents and competences are combined in a comprehensive subject area. The students gain a deeper understanding of the interactions and interfaces between bioresources and process engineering for the establishment of a sustainable bioeconomy.

| Thermal Separation Processes (L03 Separation Processes (L1159) | (41) | Recitation Section (large) Practical Course | 1 | 1 |
| • | Prof. Irina Smirnova | Tractical Course | - | - |
| Module Responsible Admission Requirements | None | | | |
| Recommended Previous | | | | |
| Kecommended Previous Knowledge | Recommended requirements: Thermodynamics III | | | |
| Kilowieuge | | | | |
| Educational Objectives | After taking part successfully, students have reached the fol | lowing learning results | | |
| Professional Competence | | | | |
| Knowledge | | t types of constation processes | cuch as distillat | ion overaction and |
| | The students can distinguish and describe differen adsorption | t types of separation processes | such as distillat | ion, extraction, and |
| | adsorption The students develop an understanding for the course of concentration during a separation process, the estimation | | | he estimation of the |
| | energy demand of a process, the possibilities of energy | | | ne estimation or the |
| | They have good knowledge of designing methods for | | | |
| | | • | | |
| | | | | |
| | | | | |
| | | | | |
| Skills | Using the gained knowledge the students can select | a reasonable system boundary for | a given separa | tion process and can |
| | close the associated energy and material balances | | | · |
| | The students can use different graphical methods | for the designing of a separation | process and d | efine the amount of |
| | theoretical stages required | | | |
| | They can select and design a basic type of therma | I separation process for a given | case based on | the advantages and |
| | disadvantages of the process | | | |
| | The students are capable to obtain independently th | e needed material properties fron | n appropriate so | urces (diagrams and |
| | tables) | | | |
| | They can calculate continuous and discontinuous prod | | | |
| | The students are able to prove their theoretical know | - ' | | |
| | The students are able to discuss the theoretical back | ground and the content of the ex | perimental work | with the teachers in |
| | colloquium. | | | |
| | The students are capable of linking their gained knowledge | with the content of other lectures | and use it togeth | er for the solution of |
| | technical problems. Other lectures such as thermodynamics | , fluid mechanics and chemical en | gineering. | |
| | | | | |
| | | | | |
| Personal Competence | | | | |
| Social Competence | | | d and a college for the college | |
| | The students can work technical assignments in small | groups and present the combined | results in the ti | itoriai |
| | The students are able to carry out practical lab wor | k in small groups and organize a | functional divisi | on of labor between |
| | them. They are able to discuss their results and to do | 3 , | | on or labor between |
| | | | | |
| Autonomy | The students are capable to obtain the needed inform | nation from suitable sources by the | mealyon and ac | coss their quality |
| | The students are capable to obtain the needed inform The students can proof the state of their knowledge. | • | | |
| | learning process | ge with exam resembling assigni | nents and in th | is way control their |
| | learning process | | | |

| | The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and fellow students. The students work small groups with a high degree of division of labor. For every experiment, the students write a report. They receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they can increase their capabilities in this area. Topics of the practical course: Introduction in the thermal process engineering and to the main features of separation processes Simple equilibrium processes, several steps processes Distillation of binary mixtures, enthalpy-concentration diagrams Extractive and azeotrope distillation, water vapor distillation, stepwise distillation Extraction: separation ternary systems, ternary diagram Multiphase separation including complex mixtures Designing of separation devices without discrete stages Drying Chromatographic separation processes Membrane separation Energy demand of separation processes |

| Knowledge | methods for engineers. | | | |
| Educational Objectives | After taking part successfully, students have reache | ed the following learning results | | |
| Professional Competence | | | | |
| Knowledge | The students are able to explain basic concepts of | chemical reaction engineering. They are | able to point out | differences between |
| | thermodynamical and kinetical processes. The stu | idents have a strong ability to outline p | arts of isotherma | l and non-isothermal |
| | ideal reactors and to describe their properties. | | | |
| Skills | After successful completion of the module, students | s are able to: | | |
| | - apply different computational methods to dimensi | on isothermal and non-isothermal ideal r | eactors, | |
| | - determine and compute stable operation points fo | or these reactors , | | |
| | - conduct experiments on a lab-scale pilot plants ar | nd document these according to scientific | guidelines. | |
| Personal Competence | | | | |
| Social Competence | After successful completition of the lab-course the | students have a strong ability to organi | ze themselfes in s | small groups to solve |
| | issues in chemical reaction engineering. The stud- | ents can discuss their subject related k | nowledge among | each other and with |
| | their teachers. | | | |
| Autonomy | The students are able to obtain further inform | ation and assess their relevance auto | nomously. Stude | nts can apply their |
| | knowldege discretely to plan, prepare and conduct | experiments. | | |

| Cycle | WiSe |
| content | Fundamentals of chemical reaction engineering, definitions, calculation of species concentrations (reactor, reaction mixture, reactants, products, inerts and solvents, reaction volume, Reaktor volume, chemical reaction, mass, moles, mole fraction, volume, density, molar concentration, mass-concentration, molality, partial pressure, hydrodynamic residence time, space time, extent of reaction, reactor throughput, reactor load, conversion, selectivity, yield, concentration calculations in stationary and flowing multicomponent-mixtures) |
| | Stoichiometry and stoichiometric calculations (simple reactions, complex reactions, key reactions, key species, matrix of stoichiometric coefficients, linear dependent and independent reactions, element-species-matrix, row reduced form of a matrix, rank of a matrix, Gauss Jordan elimination, relation between stoichiometry and kinetics, calculating the extent of reaction from mole number changes in complex reactions) |
| | Thermodynamics (What is thermodynamics?, importance of thermodynamics in chemical reaction engineering, zeroth law of thermodynamics, temperature scales, temperature measurements in praxis, first law of thermodynamics, internal energy, enthalpy, calorimeter, heat of reaction, standard heat of formation, Hess law, heat capacity, Kirchhoff law, standard heat of reaction, pressure dependence of the heat of reaction, second law of thermodynamics, reversible and irreversible processes, entropy, Clausius inequality, free energy, Gibbs Energy, chemical potential, chemical equilibrium, activity, van't Hoff law, calculation of chemical equilibrium, principle of Le Chatelier and Braun, equilibrium calculations in multiple reaction systems, Lagrange Multipliers) |
| | Chemical kinetics (reversible and irreversible reactions, homogeneous and heterogeneous reactions, elementary step, reaction mechanism, microkinetics, macrokinetics, formal kinetics, reaction rate, rate of change of species mole number, Arrhenius-equation, activation energy and pre-exponential factor for komplex reactions, reactions of 0., 1. and 2. order, analytical integration |

of rate laws, Damköhler-number, differential and integral method of kinetic analysis, laboratory reactors for kinetic measurements, half life, kinetics of complex reactions, parallel reactions, reversible reactions, sequence of reactions, irreversible reaction with pre-equilibrium, reduction of reaction mechanisms, quasi-stationarity principle of Bodenstein, rate limiting step, Michaelis-Menten kinetics, analytical integration of first order differential equations - integrating factor, numerical integration of complex kinetics)

Types of chemical Reaktors (chemical reactors in industry and laboratory, ideal vs. real reaktors, discontinuous, half continuous and continuous reactors, single phase - biphasic- and multiphase reactors, batch-reactor, semi-batch reactor, CSTR, Plug Flow reactor, fixed bed reactor, adiabatic staged reactors, rotating furnaces, fluidized bed reactors, gas-liquid-reactors, multi-phase reactors)

Isothermal ideal reactors (mole-balance of a chemical reactor, mole balance of a batch reactor, integration of the batch reactor mole balance for various kinetics, partial fraction decomposition, mole balance of the semi-batch reactor, mole balance of the plug flow reactor, analogy batch reactor - plug flow reactor, design of plug flow reactors for reactions with volume change and complex reactions, mole balance of a fixed bed reactor, design of a membrane reactor, mole balance of a continuously stirred tank reactor, comparison of CSTR and PFR with respect to conversion and selectivity, mole-balance of a cascade of tank reactors, numerical-interative calculation of a cascade of tank reactors, Newton-Raphson method, graphical analysis of a cascade of tank reactors)

non-isothermal ideal reactors (energy balance of a reactor, adiabatic reactor, adiabatic temperature rise, staged reactor for adiabatic exothermic reactions limited by chemical equilibrium, design of an adiabatic plug flow reactor, Levenspiel-plots, heat transfer through a reactor wall, heat transfer by convection, heat conduction, heat transfer through a cylindrical wall, design of a plug flow reactor in parallel and counter flow, heat balance of the cooling fluid, CSTR with heat exchange, multiple stationary states, ignition-extinction behavior, stability of a CSTR, complex reactions in non-isothermal reactors, optimum temperature profile of a reactor)

| | *CSTR in Series - Residence time distribution, reaction |
| | * Plug Flow Reactor - Residence time distribution, reaction |
| | Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice. |
| | The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course. |

| Recommended Previous | keine | | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reached the f | following learning results | | |
| Professional Competence | | | | |
| Knowledge | The students, based on a literature survey, learn to study in detail a subject theme from the disciplines of green technologies and deliver afterwards a summary presentation to a specialised audience. Environmental issues and their multidisciplinary linkages are preferred, when selecting the thematic area of these studies. Through their own written contribution the students communicate an overview over the subject and practice technical writing. With the discussion the students practice scientific debating on a specialised subject matter. | | | |
| Skills | The students can, when working on a technical topic not for a conduct a literature survey choose the relevant information for their presentation is prepare a written summary present results in front of peers and staff correctly cite and reference sources. | | | |
| Personal Competence Social Competence | The students practice a critical assessment of the literatu their own technical sub-topic tailored to their public and students can formulate questions to other speakers and particular the fulfilment of the tasks combines independent work with | discuss with the audience. Wharticipate in the ensuing discus | en attending technica | • |
| Autonomy | The students can, guided by instructors, critically reflect o | n their learning and work statu | s, and write a scientifi | c report. |

| Content | Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes). | |

| Fundamental Biological and Bioche | emical Practical Course (L2901) | Practical Course | 3 | 3 |
| Introduction to the Biological and B | Biochemical Practical Course (L2902) | Lecture | 1 | 1 |
| Module Responsible | - | | | |
| Admission Requirements | | | | |
| Recommended Previous Knowledge | The module is divided into two parts. In the winter knowledge is required for this lecture. In the follow into an internship and an introductory lecture. For its strongly recommended. | ring summer semester, the second par | t of the module is of | fered. This is divided |
| Educational Objectives | After taking part successfully, students have reache | ed the following learning results | | |
| Professional Competence | | | | |
| Knowledge | The module aims to teach you the basic principles of biological systems and biocatalysts. You will learn how organisms are constructed and what basic characteristics can be used to distinguish organisms from the three kingdoms of life. You will learn about the ways in which biological systems can produce energy and you will apply the principles of biological thermodynamics. In addition, you will learn how enzymes are constructed and, using some classes of enzymes as examples, you will learn how enzymes exert their effect. | | | |
| | At the end of the module | | | |
| | - you will be able to describe basic principles of livin | | | plying them. |
| | - you will be able to assign organisms to the three k | | | |
| | - you will be able to describe the tasks of enzymes | generically on the basis of some exam | pie reactions | |
| | you will be able to deduce from the basic characteristics of organisms and enzymes which biotechnological application possible with these systems. you can understand and use the technical vocabulary of biological systems and processes | | | gical applications are |
| | | | | |
| | - you will be able to perform simple bioinformatic o | perations to assign DNA sequences to | a function | |
| | - you can confidently apply the basic principles of u | using primary literature | | |
| Skills | The students master the basic techniques of sterile work and molecular diagnostics. They can independently prepare media and maintain microorganisms in culture. In addition, they can isolate and characterize organisms from enrichment cultures and environmental samples. | | | |
| Personal Competence | | | | |
| Social Competence | The students are able, | | | |
| | - to gather knowledge in groups of about 2 to 10 st | udents | | |
| | - to introduce their own knowledge and to argue th | eir view in discussions in teams | | |
| | - to divide a complex task into subtasks, solve thes | e and to present the combined results | | |
| Autonomy | Students are able to independently structure their internship days and prioritize tasks. Furthermore, they are able to collect and process basic information on microorganisms via a literature search. | | | |

| Content | In the lecture we will learn the basic characteristics of organisms of all kingdoms of life. This includes cell biology as well as cell physiology. We understand the energetic foundations of living systems and the variety of possible metabolic concepts of life. From these basic laws we will understand how and to what extent an application and genetic reprogramming of organisms for application can take place. |

| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. |
| | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups of selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the but knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

| | Widespread techniques of microbiological, biochemical and genetic approaches will be taught during this course. |
| | Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice. |
| | The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course. |
| | Topics and Methods of the course include: - Morphology and growth of different bacteria strains |
| | - Measuring of microbial growth by turbidity |
| | - Preparation of several culture media |
| | - Strain identification by gram staining and analytical profile index (API test) |
| | - Genetic background identification by 16S rRNA analysis |
| | - Microscopy |
| | - BLAST analyses |
| | - Colony PCR procedure |
| | - Enzyme activity measurements and kinetics (Michaelis-Menten equation, Lineweaver-Burk plot) |
| | - Enzymes as biocatalysts (exemplarily use of enzymes in detergents) |
| | - Measurement of protein concentrations (Bradford protein assay) |
| | - Qualitative and quantitative enzyme activity assay |

| Content | This lecture deals with the legal framework of biotechnological and chemical work. On the basis of the acts and ordinacesto be considered (e.g. Occupational Health and Safety Act, Biological Substances Ordinance, Genetic Engineering Act, etc.), the legal frameworks are explained. In addition, requirements for safety classifications of genetic engineering work and the equipment of laboratories for genetic engineering work genetic are presented. Furthermore, national and international requirements for drug production with industrial reference are discussed. |
| Literature | Die zum Zeitpunkt der Vorlesung gültigen Gesetze werden in der Vorlesung dargestellt und bekanntgegeben. |

| Module M1770: Bioinf | formatics |
|------------------------------|---|
| Courses | |
| Title Bioinformatics (L2899) | TypHrs/wkCPSeminar23 |
| Module Responsible | Prof. Johannes Gescher |
| Admission Requirements | None |
| Recommended Previous | Students should be familiar with the basics of molecular biology and genetics, and have knowledge of microbial cultivation. |
| Knowledge | In addition, prior knowledge of DNA sequencing technologies and the phylogenetic tree of life is advantageous. Also helpful is some experience with command line based computer input. |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| | During the course, students gain knowledge of different application areas of DNA sequencing technologies, the potential in previously uncharacterized microbial metabolic pathways, how life forms differ in the metabolism of microbes, and the benefits in the growth of microbial communities. By the end of the seminar, participants will be familiar with the basics of command line usage and the difficulties of dealing with large data sets. Specifically, applications for analyzing sequencing data will be practiced, as well as interpretation for characterizing microbial systems. |
| | Topics covered in the course: |
| | - Genome sequencing on a MinION |
| | - De novo genome assembly |
| | - Metagenome analyses |
| | - Functional and taxonomic annotation of gene sequences |
| | - Construction of phylogenetic trees |
| | - Representation of metabolic pathways |
| | - Genome mining |
| | - Protein structure analyses |
| Personal Competence | |
| Social Competence | Tasks are worked on in groups. Whereby a clear presentation of the used parameters, methods and intermediate results must be chosen for communication in the group. |
| Autonomy | Students will be able to summarize their findings from the completed subtasks in a report. |
| Workload in Hours | Independent Study Time 62, Study Time in Lecture 28 |

Specialization Energy Systems / Renewable Energies

The specialisation "Energy Systems" aims to provide students with an in-depth understanding of the fundamental content in (regenerative) energy systems; this also applies to future-oriented (energy) technologies. The focus is on the interactions of new processes of climate-friendly energy supply and integration of renewable energies with the fundamentals of process, energy and environmental technology. In this specialisation, students acquire competences in the area of "green" technologies as part of a future-oriented and thus sustainable energy system.

| Content | Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes). | | |

| 3011311 | Lecture Content: |
| | The goal of this lecture is to address and present technical measures to mitigate climate change. This primarily includes the immediate means by which climate gas emissions can be reduced when they have already occurred. Specifically, the lecture includes the following content: |
| | - Overview of the main greenhouse gases emitted, including their global warming potential and the average lifetime of the molecules in the atmosphere. |
| | - Avoidance Methane (CH ₄) (point sources). |
| | o Emission sources: Methane slip, methane emission from combustion, etc. |
| | o Reduction methane slip (including gas extraction, biogas plants, waste management). |
| | o Reduction of methane from combustion (e.g. power plants, ship engines, car engines, CHP engines, etc.) |
| | o Reduction of other sources if necessary |
| | - Avoidance Nitrous oxide (N ₂ O) (point sources). |
| | o Emission sources: Combustion processes, production processes, biological nitrogen oxidation, etc. |
| | o Reduction of combustion processes |
| | o Reduction of production processes |
| | o Reduction of biological nitrogen oxidation |
| | o Reduction of further sources, if necessary |
| | - Avoidance of other greenhouse gases (including F-gases) (point sources) |
| | - Avoidance of carbon dioxide from fossil carbon (point sources) |
| | o Emission sources: Combustion processes, production processes |
| | o Capture technologies from exhaust gases |
| | - Capture carbon dioxide from diffuse sources (ambient air) |
| | - Temporary storage and transport of carbon dioxide |
| | - Final storage of carbon dioxide |
| | o Geological framework and storage options, infrastructure (assessment) |
| | o Surface installations / modes of operation / conditioning of CO $_{\rm 2}$ (phase behavior) etc. |
| | o Thermodynamic framework and interactions |

| Module M0544: Phase | e Equilibria Thermodynamics | | | |
|-----------------------------------|--|---|-------------------|-----------------------|
| Courses | | | | |
| Title | | Тур | Hrs/wk | СР |
| Phase Equilibria Thermodynamics (| L0114) | Lecture | 2 | 2 |
| Phase Equilibria Thermodynamics (| L0140) | Recitation Section (small) | 1 | 2 |
| Phase Equilibria Thermodynamics (| L0142) | Recitation Section (large) | 1 | 2 |
| Module Responsible | Prof. Irina Smirnova | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Mathematics, Physical Chemistry, Thermodynamics | I and II | | |
| Knowledge | | | | |
| | | | | |
| Educational Objectives | After taking part successfully, students have reach | ed the following learning results | | |
| Professional Competence | | | | |
| Knowledge | Starting from the very basics of thermodyn | namics, the students learn the mathematic | cal tools to desc | ribe thermodynamic |
| | equilibria. | | | |
| | They learn how state variables are influence | ed by the mixing of compounds and learn | concepts to qu | antitatively describe |
| | these properties. | | | |
| | Moreover, the students learn how phase ed | quilibria can be described mathematically | and which phen | omena may occur if |
| | different phases (vapor, liquid, solid) coexist | in equilibrium. Furthermore the fundament | als of reaction e | quilibria are taught. |
| | For different phase equilibria, several exar | nples relevant for different kinds of proce | esses are shown | and the necessary |
| | knowledge for plotting and interpreting the e | equilibria are taught. | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| Skills | Applying their knowledge, the students are | able to identify the correct equation for | the determination | on of the equilibrium |
| | state and know how to simplify these equation | | | |
| | The students know models which can be us | ed to determine the properties of the syst | em in the equilib | orium state and they |
| | are able to solve the resulting mathematical | relations. | | |
| | For specific applications, they are able to se | lf-reliantly find necessary physico-chemica | properties of co | ompounds as well as |
| | model parameters in literature sources. | | | |
| | Beside pure compound properties the studer | | | |
| | The students know how to visualize phase ed | | | |
| | Based on their knowledge, the students a | | cepts that are | the basis for many |
| | separation and reaction processes in chemic | al engineering. | | |
| | | | | |
| | | | | |
| Personal Competence | | | | |
| Social Competence | The students are able to work in small groups, to | solve the corresponding problems and to | present them or | aly to the tutors and |
| Autonom | other students | | | |
| Autonomy | The students are able to find necessary infor | mation self-reliantly in literature sources a | nd to judge their | quality. |
| | During the semester the students are abl | e to check their learning progress conti | nuously in exer | ises. Based on this |
| | knowledge the students can adept their lear | ning process. | | |
| | | | | |

| Cycle | WiSe/SoSe |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. |
| | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on some selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

Specialization Energy Technology

The aim of the specialisation "Energy Technology" is to enable students to plan and calculate plants and machines and to familiarise them with various technologies for energy conversion, energy distribution and energy application. Processes can be analysed, abstracted and modelled using scientific methods. Students can assess data and results and use them to develop strategies for innovative solutions.

| Content | Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes). |

| CP | 1 |
| | |
| Workload in Hours | |
| Lecturer | |
| Language | |
| Cycle | |
| Content | In the 1 st part of the lecture a general introduction into fluid-flow machines and steam power plants is offered, including: |
| | Energy balance of a fluid-flow machine |
| | Theory of turbine and compressor stage |
| | Egual and positive pressure blading |
| | Flow losses |
| | Characteristic numbers |
| | Axial and radial design |
| | Design features |
| | Hydraulic fluid-flow machines |
| | Pump and water turbine designs |
| | Design examples of reciprocating engines and turbomachinery |
| | Steam power plants |
| | Gas turbine systems |
| | Diesel engine systems |
| | Waste heat utilisation |
| | followed by the more specialised issues: |
| | Florida Donor and and English Donor and En |
| | Electricity Demand and Forecasting The wave departing for a least state. |
| | Thermodynamic fundamentals Figure Conversion in Thermod Device Plants |
| | Energy Conversion in Thermal Power Plants There of Power Plant |
| | Types of Power Plant Layout of the power plant black |
| | Layout of the power plant block Individual elements of the power plant |
| | Cooling systems |
| | Flue gas cleaning |
| | Operation characteristics of the power plant |
| | Construction materials |
| | Location of power plants |
| | The environmental impact of acidification, fine particulate or CO ₂ emissions and the resulting climatic effects are a special focus of |
| | |
| | the lecture and the lecture hall exercise. The challenges in plant operation from interconnecting conventional power plants and renewable energy sources are discussed and the technical options for providing security of supply and network stability are presented, also under consideration of cost effectiveness. In this critical review, focus is especially placed on the compatibility of the different solutions with the environment and climate. With this, the awareness for the responsibility of an engineer's own |
| | actions are emphasized and the potential extent of the different solutions presented clearly. |
| | Within the framework of the exercise the students learn the use of the specialised software suite EBSILON Professional TM. With th |
| | tool small tasks are solved on the PC, to highlight aspects of the design and development of power plant cycles. The students |
| | present their results orally and can afterwards ask questions and get feedback. The course work has a positive effect on the |
| | students final grade. |

| Module Responsible | Prof. Thorsten Kern |
| Admission Requirements | None |
| Recommended Previous | Basics of mathematics, in particular complexe numbers, integrals, differentials |
| Knowledge | Basics of electrical engineering and mechanical engineering |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Students can to draw and explain the basic principles of electric and magnetic fields. |
| | They can describe the function of the standard types of electric machines and present the corresponding equations an characteristic curves. For typically used drives they can explain the major parameters of the energy efficiency of the whole syster from the power grid to the driven engine. |
| Skills | Students are able to calculate two-dimensional electric and magnetic fields in particular ferromagnetic circuits with air gap. For this they apply the usual methods of the design auf electric machines. |
| | They can calulate the operational performance of electric machines from their given characteristic data and selected quantitie and characteristic curves. They apply the usual equivalent circuits and graphical methods. |
| Barrard Comment | |
| Personal Competence | |
| Social Competence | |
| Autonomy | Students are able independently to calculate electric and magnatic fields for applications. They are able to analyse independently the operational performance of electric machines from the characteristic data and they can calculate thereof selected quantities and characteristic curves. |

| in Hours | |
| Lecturer | Prof. Christian Lüthje |
| Language | DE |
| Cycle | WiSe/SoSe |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. |
| | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on s selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

| Module M0659: Funda | amentals of Ship Structural Design | and Analysis | | |
|---|--|--|-------------------|------------------------|
| Courses | | | | |
| | | - | Here feeds | |
| Title Fundamentals of Ship Structural De | Typ Lecture | Hrs/wk 2 | CP 2 | |
| Fundamentals of Ship Structural De | | Recitation Section (small) | 1 | 2 |
| Fundamentals of Ship Structural Ar | _ | Lecture | 2 | 2 |
| Fundamentals of Ship Structural Ar | nalysis (L0414) | Recitation Section (small) | 1 | 2 |
| Module Responsible | Prof. Sören Ehlers | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Mechanics I - III | | | |
| Knowledge | Fundamentals of Materials Science I - III | | | |
| | Welding Technology I | | | |
| | Fundamentals of Mechanical Design I - III | | | |
| | | | | |
| Educational Objectives | After taking part augagafully atualanta have gagle | d the fellowing learning regults | | |
| Professional Competence | After taking part successfully, students have reache | a the following learning results | | |
| | Students can reproduce the basic contents of the st | ructural hobaviour of chip structures, the | y can avalain the | theory and mothods |
| Knowieage | for the calculation of deformations and stresses in b | · | y can explain the | theory and methods |
| | Furthermore, they can reproduce the basis content | s of codes (rules), materials, semi-finish | ed products, join | ing and principles of |
| | structural design of components in the ship structur | | | |
| | | | | |
| | | | | |
| Skills | Students are capable of applying the methods an | d tools for the calculation of linear defe | ormations and st | resses in the above |
| | mentioned structures; they can choose calculation models of typical ship structures. | | | |
| | From the arms are the sure of the second sec | do of decreios and sision the chin atmests | o they can eale | st avitable mesteriels |
| | Furthermore, they are capable to apply the method semi-finished products and joints. | is of drawing and sizing the ship structur | e; they can selec | Li Sullable Materials, |
| | semi-inistieu products and joints. | | | |
| | | | | |
| Personal Competence | | | | |
| Social Competence | The students are able to communicate and cooper | rate in a professional environment in the | e shipbuilding an | d component supply |
| | industry. | | | |
| | | | | |
| Autonomy | The students are capable to independently idealize | | ole methods for a | analysis of beam-like |
| | structures; they are capable to assess the results of | structural analyses. | | |
| | Furthermore, they are capable to assess drawin | gs of complex ship structures and to | design ship st | ructures for various |
| | requirements and boundary conditions. | | | |
| | | | | |

| Content | As preparation for the lecture "Hydrostatics", the students must develop a body plan of a modern twin screw vessel (cruise liner, RoPAx- feryy, RoRo) and perform elementary volumetric computations. The body plan is to be developed from a given GA or can be designed freely. All computations shall be based on graphical integration methods. The body plan consists of: - Grid - approx. 20 sections, 5 Waterlines, 5 Buttocks - Computation Volume and centre of buoyancy for several drafts - Computation of Righting Lever curve for a given displacement based on and graphical integration for several heeling angles. |

| | Students should have sound knowledge of engineering m with the foundations of partial/ordinary differential equathermodynamics. | | | |
| Educational Objectives | After taking part successfully, students have reached the | following learning results | | |
| | Students will have the required combined knowledge of thermo-/fluid dynamics and numerical analysis to translate general principles of thermo-/fluid engineering into discrete algorithms on the basis of local (finite differences/volumes) and global (potential theory) ansatz functions. They are familiar with the similarities and differences between different discretisation and approximation concepts for investigating coupled systems of non-linear, convective partial differential equations (PDE), and explain the motivation for applying them. Students have the required background knowledge to develop, code, explain and apply numerical algorithms dedicated to the solution of thermofluid dynamic PDEs. They are familiar with most numerical methods used to predict thermofluid dynamic fields, in particular their realms and limitations. The students are able choose and apply appropriate numerical procedures that integrate the governing thermofluid dynamic PDEs. | | | |
| | in space and time. They can apply/optimise numeric computational algorithms in a structured way, apply t extract simulation data for an engineering analysis. | | | |
| Personal Competence Social Competence | The students are able to discuss problems, present the r solution strategies that address given technical reference | | tly develop, impl | ement and report o |
| Autonomy | The students can independently analyse numerical me analyse own results as well as external data with regards | | problems. They | are able to criticall |

| Content | Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes). |

| | The seminar offers an introduction into the diverse aspects of academic research and writing: Finding the topic, finding specialized information, knowledge organisation, writing, presenting and publishing. Suggestions for reflecting own processes of learning, informing and writing - in addition to practical recommendations and tips - facilitate the start and the creation of bachelor and master theses, works, which bring thoroughly self-fulfillment and make fun. Topics of the seminar will be in particular Scientific scholarship and academic research methods: Introduction, organization, attributes of science: How is scientific knowledge created? Work scheduling, finding topics, time management, specialities of academic research in engineering Finding specialized information: Full texts and library resources, databases http://www.tub.tuhh.de/en/subject-information/informing-points-to-survive/ Reference management: http://www.tub.tuhh.de/en/publishing/reference-management/ Knowledge organisation and creating publications with Citavi Citing correctly and avoiding plagiarism Preparing and doing presentations | | | |

| Admission Requirements | None | | | | | |
| Recommended Previous | · · · · · · · · · · · · · · · · · · · | | | | | |
| Knowledge | Basics of electrical engineering and mechanical engineering | | | | | |
| Educational Objectives | After taking part successfully, students have reached the following learning results | | | | | |
| Professional Competence | | | | | | |
| Knowledge | Students can to draw and explain the basic principles of electric and magnetic fields. | | | | | |
| | They can describe the function of the standard types of electric machines and present the corresponding equations and characteristic curves. For typically used drives they can explain the major parameters of the energy efficiency of the whole system from the power grid to the driven engine. | | | | | |
| Skills | Students are able to calculate two-dimensional electric and magnetic fields in particular ferromagnetic circuits with air gap. Fo this they apply the usual methods of the design auf electric machines. | | | | | |
| | They can calulate the operational performance of electric machines from their given characteristic data and selected quantities and characteristic curves. They apply the usual equivalent circuits and graphical methods. | | | | | |
| | | | | | | |
| Personal Competence | | | | | | |
| Social Competence | | | | | | |
| Autonomy | Students are able independently to calculate electric and magnatic fields for applications. They are able to analyse independently the operational performance of electric machines from the characteristic data and theycan calculate thereof selected quantities and characteristic curves. | | | | | |

| Management Tutorial (L0882) Introduction to Management (L088 | 0) | Recitation Section (small) Lecture | 2 3 | 3 3 | |
| Module Responsible | | Lecture | 3 | 3 | |
| Admission Requirements | None | | | | |
| | Basic Knowledge of Mathematics and Business | | | | |
| Knowledge | | | | | |
| Educational Objectives | | | | | |
| Professional Competence | | | | | |
| Knowledge | After taking this module, students know the important basics of many different areas in Business and Management, from Planning and Organisation to Marketing and Innovation, and also to Investment and Controlling. In particular they are able to | | | | |
| | explain the differences between Economics and Management and the sub-disciplines in Management and to name important definitions from the field of Management explain the most important aspects of and goals in Management and name the most important aspects of entreprneurial projects describe and explain basic business functions as production, procurement and sourcing, supply chain management organization and human ressource management, information management, innovation management and marketing explain the relevance of planning and decision making in Business, esp. in situations under multiple objectives and uncertainty, and explain some basic methods from mathematical Finance | | | | |
| Ckilla | state basics from accounting and costing and se | - | icativas atvatas | ing ata) and to some | |
| Skills | Students are able to analyse business units with respe out an Entrepreneurship project in a team. In particular • analyse Management goals and structure them a | they are able to | jecuves, strateg | ies etc.) and to cari | |
| | analyse organisational and staff structures of co apply methods for decision making under multip analyse production and procurement systems ar analyse and apply basic methods of marketing select and apply basic methods from mathematic | ecision making under multiple objectives, under uncertainty and under risk and procurement systems and Business information systems | | | |
| Personal Competence Social Competence | Students are able to | | | | |
| Autonomy | work successfully in a team of students to apply their knowledge from the lecture to an entrepreneurship project and write a coherent report on the project to communicate appropriately and to cooperate respectfully with their fellow students. Students are able to work in a team and to organize the team themselves to write a report on their project. | | | | |

| Lecturer | Prof. Christian Lüthje |
| Language | DE |
| Cycle | WiSe/SoSe |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. |
| | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on s selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

Specialization Water Technologies

In the specialisation "Water", process engineering, construction and environmental science contents and competences are combined in a comprehensive water-specific subject area. Students gain a deeper understanding of the interactions and interfaces between urban water management and ecosystems as well as water and energy management.

| Knowledge | | | | | | |
| Educational Objectives | After taking part successfully, students have reached the | e following learning results | | | | |
| Professional Competence | | | | | | |
| Knowledge | The students, based on a literature survey, learn to study in detail a subject theme from the disciplines of green technologies and deliver afterwards a summary presentation to a specialised audience. Environmental issues and their multidisciplinary linkages are preferred, when selecting the thematic area of these studies. Through their own written contribution the students communicate an overview over the subject and practice technical writing. With the discussion the students practice scientific debating on a specialised subject matter. | | | | | |
| Skills | The students can, when working on a technical topic not familiar to them: conduct a literature survey choose the relevant information for their presentation prepare a written summary present results in front of peers and staff correctly cite and reference sources. | | | | | |
| Personal Competence Social Competence Autonomy | their own technical sub-topic tailored to their public an students can formulate questions to other speakers and The fulfilment of the tasks combines independent work was a sub-topic tailored to their public and students are supported to the sup | d discuss with the audience. | Content | Students carry out a research project in a scientific field under the guidance of an academic staff member. For this purpose, the student can approach the staff of the respective institute and discuss a topic. The topic is then worked on within 4 weeks and regular consultations are held with the supervisor. The student research project should be the size of a scientific article and must be presented to the lecturer after completion as part of a presentation (approx. 15 minutes). |

| Content | The seminar offers an introduction into the diverse aspects of academic research and writing: Finding the topic, finding specialized information, knowledge organisation, writing, presenting and publishing. Suggestions for reflecting own processes of learning, informing and writing - in addition to practical recommendations and tips - facilitate the start and the creation of bachelor and master theses, works, which bring thoroughly self-fulfillment and make fun. Topics of the seminar will be in particular |

| Module Responsible | Prof. Peter Fröhle | | | | |
| Admission Requirements | None | | | | |
| Recommended Previous Knowledge | Basic knowledge of analysis and differenti hydromechanical and hydraulic engineerin | • | | | |
| Educational Objectives | After taking part successfully, students have read | thed the following learning r | results | | |
| Professional Competence | | | | | |
| Knowledge | Students are able to define the basic tasks and terms of nature-oriented hydraulic engineering und groundwater hydrology. They cam describe the basics concepts, the basic approaches and methods of nature-oriented hydraulic engineering, groundwater hydrology and groundwater modelling and are able to apply these to practical problems. | | | | |
| Skills | The students are able to apply the methods and approaches of nature-oriented hydraulic engineering and of groundwater hydrology to practical problems. They can demonstrate to transfer and apply these to simple hydraulic engineering systems. In addition, they are able to apply the approaches commonly used in groundwater hydrology. They can exemplarily explain and reason how to apply them as a basis for geo-hydrological questions. In addition, students can apply basic groundwater modelling methods to simple problems of groundwater movement and groundwater recharge. | | | | |
| Personal Competence | | | | | |
| Social Competence | Students are able to help each other solving case studies. The students are able to deploy their gained knowledge in applied problems of the practical nature-based hydraulic engineering. Additionally, they will be able to demonstrate to work cooperatively in teams consisting of engineers from different subject areas. | | | | |
| Autonomy | The students will be able to independently extend their knowledge and apply it to new problems. | | | | |

| Workload in Hours | Independent Study Time 62, Study Time in Lecture 28 |
| Lecturer | Prof. Ralf Otterpohl |
| Language | DE |
| Cycle | SoSe |
| Content | The seminar ""Infrastructure Management Wastewater"" develops the understanding of infrastructure systems in relation to wastewater systems, but also addresses other infrastructure systems. |
| | Initially, an overview of the entire system is given, including water catchment areas, water distribution, the origin of wastewater in households and industry, stormwater runoff management, and the treatment and reuse of water (constituents). Thereby the design tools especially of digital modelling are understood by practical application. Energetic considerations as well as planning and restoration of pipeline systems are covered. |
| | For wastewater treatment, the basis developed in Sanitary Engineering I will be deepened and significantly expanded, especially the resource recovery of nutrients and water. Sanitary solutions for different socio-economic and climatic conditions are understood and calculated. |

| Cycle | SoSe | |
| Content | The seminar deepens and expands the knowledge of the processes of drinking water treatment. The seminar deals with ion exchange, oxidation, disinfection, gas exchange and hybrid treatment processes. Further topics include pH adjustment and energy efficiency in water supply. Within the scope of the course, the students work out a seminar performance (presentation, design, modelling) on the basis of a task. | |

| Cycle | WiSe/SoSe |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |

Thesis

| Module M1800: Bache | elor thesis (dual study program) |
|---|---|
| Courses | |
| Title | Typ Hrs/wk CP |
| Module Responsible | Professoren der TUHH |
| Admission Requirements | None |
| Recommended Previous | |
| Knowledge | |
| Educational Objectives | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | Dual students |
| | • choose central theoretical principles from their field of study (facts, theories, methods) in relation to problems and |
| | applications, present them and discuss them critically. |
| | further develop their subject-related and practical knowledge as appropriate and link both areas of knowledge together. |
| | present the current research available on a chosen topic or on a chosen operational issue linked to their subject. |
| | |
| Skills | Dual students |
| | evaluate both the basic knowledge linked to their field of study acquired at the university and professional knowledge |
| | gained through the company, then purposefully use it to solve technical and application-related problems. |
| | • analyse questions and problems using the methods learned throughout their studies (including practical phases), reach |
| | factually justifiable decisions and develop application-specific solutions. |
| | critically analyse the results of their own research work from a subject-specific and professional perspective. |
| | |
| Personal Competence | |
| Social Competence | Dual students |
| | • present a professional problem in the form of an academic question for a specialist audience in a structured |
| | comprehensible and factually correct manner, both orally and in writing. |
| | • respond to questions as part of a specialist discussion and answer them appropriately. In doing so, they argue their own |
| | evaluations and points of view convincingly. |
| | |
| Autonomi | Dual shudanta |
| Autonomy | Dual students |
| | structure a comprehensive, chronological workflow and work independently on a question to a high academic level within |
| | a given period of time. |
| | identify, develop and link necessary knowledge and material to handle an academic and application-related problem. apply the essential techniques of academic work when conducting their own research on an operational issue. |
| | apply the essential techniques of academic work when conducting their own research on an operational issue. |
