Master

Aircraft Systems Engineering

Cohort: Winter Term 2018

Updated: 28th September 2018

Program description

Content

The consecutive Master program "Aircraft System Engineering" prepares participating students for diverse kind of professions in the field of aviation and related industries. During studies the technical, mathematical and natural science orientated Bachelor of Engineering is deepened. Competences for the systematical, scientifical and independent solution of responsible tasks in industry and research are taught.

Students learn how to use typical methods of systems engineering as well as the application of modern, computer-based techniques for system design, analysis and evaluation. This count among others methods such as model based systems engineering or model based / virtual testing. Furthermore required knowledge from different fields of aviation including aircraft systems, cabin systems, air transportation system, preliminary aircraft design, flight physics and material science is discussed.

Additionally students get insight into current research activities, e.g. in the area of fuel cells and electrical energy supply, actuators, virtual integration and aircraft level evaluation, avionics systems and software, hydraulic energy supply and integrated aircraft design.

Students are specializing in one of three fields of specialization and gaining the competence to work at the interfaces between these fields. According to their individual focuses students can adjust their studies very flexible due to the various numbers of offered elective courses.

Career prospects

The consecutive Master program "Aircraft System Engineering" prepares participating students for diverse kind of professions in the field of aviation and related industries. Graduates can, due to their specialization in one of the fields of Aircraft Systems Engineering, Cabin Systems, Air Transportation System or Preliminary Aircraft Design, work directly in one of these. Furthermore they have various methodically and interdisciplinary knowledge, so that they are prepared for multidisciplinary kind of jobs.

Graduates can work at Universities or other research institutes or apply directly for jobs in the industry. There they can start a carrier as a technical expert or qualify, with growing experiences, for technical management jobs such as project, group, team or development manager.

Besides starting their career in the aviation industry the master program allows, due to its system technical character, graduates to apply for jobs in other industries like the automotive or wind energy industry.

Learning target

Graduates can:

- Analyze and solve problems in a scientific way, even if they are defined unusual or incomplete and having competitive specifications;
- Abstract and formulate complex problems from a new or developing part of their discipline;
- Apply innovative methods to fundamental problems and develop new scientific methods;
- Recognize information demand, find and supply information;
- Plan and conduct theoretical and experimental analysis;
- Interpret data in a critical way and draw conclusions from them;
- Investigate and evaluate the application of emerging technologies;

Graduates are able to:

- Develop concepts and solutions for fundamental, partly unusual problems if necessary by involving other disciplines;
- Create and develop new products, processes and methods;
- Use engineering judgment in order to work with complex, potentially incomplete information, recognize contradictions and deal with them;
- Classify methodically and combine systematically knowledge from different disciplines and deal with complexity;
- Work themselves systematically into new tasks within a short period of time;
- Reflect non-technical effects of engineers work systematically and take them responsible into account;
- Work out solutions that have a demand for depend methodical competences;
- Work scientifically with the goal to achieve a PhD degree.

Program structure

The master program "Aircraft Systems Engineering" is designed modular and oriented at the university wide program structure with an unified module size (multiples of six ECTS). It consists of a 60 ECTS curriculum of key qualifications that has to be taken by all students. It includes, among other, a so called system development project. Furthermore students have to choose one of the three offered curricula of specialization (30 ECTS), containing one obligatory module and a catalog of elective modules. The master program is completed by a master thesis.

All obligatory modules of the curriculum of key qualification and curricula of specializations are offered in the first two semesters of studies. The third semester only contains elective modules, which ease students to plan a semester abroad.

Core qualification

The students extend their knowledge and skills in advanced engineering, aviation related subjects. Besides technical knowledge students strengthen their methodical skills in the fields of Aircraft Systems Engineering, Cabin Systems, Aircraft Design, Flight Physics and Systems Engineering. By performing the Systems Engineering Development Project, students apply their acquired skills in teams on a practical engineering problem.

Module M0523: B	Business & Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous Knowledge	None
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Skills	 Students are able to apply basic methods in selected areas of business management. Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.
Personal Competence	
Social Competence	 Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	 Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter
Admission Requirements	None
Recommended Previous Knowledge	None
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studi require but are not able to cover fully. Self-reliance, self-management, collaboration as professional and personnel management competences. The department implements the training objectives in its teaching architecture , in its teaching and learning arrangements , teaching areas and by means of teaching offerings in which students can qualify by opting is specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementa courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offeri ensures that courses in the nontechnical academic programms follow the specific profiling TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regar the individual development of competences. It also provides orientation knowledge in the fo of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program need be, it can be studied in one to two semesters. In view of the adaptation problems the individuals commonly face in their first semesters after making the transition from school university and in order to encourage individually planned semesters abroad, there is obligation to study these subjects in one or two specific semesters during the course studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other acro semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learni in courses are part of the learning architecture and are deliberately encouraged in speci courses.
Karalada	Fields of Teaching
Knowledge	are based on research findings from the academic disciplines cultural studies, social studie arts, historical studies, communication studies, migration studies and sustainability researc and from engineering didactics. In addition, from the winter semester 2014/15 students on Bachelor's courses will have the opportunity to learn about business management and sta ups in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. He the focus is on encouraging goal-oriented communication skills, e.g. the skills required outgoing engineers in international and intercultural situations.
	The Competence Level

	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc. This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in
	their future working life.
	Specialized Competence (Knowledge)
	Students can
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
	Professional Competence (Skills)
	In selected sub-areas students can
Skills	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.
Personal Competence	Personal Competences (Social Skills)
	Students will be able
Social Competence	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
	Personal Competences (Self-reliance) Students are able in selected areas
	• to reflect on their own profession and professionalism in the context of real-life fields of
	י נפן

Autonomy	 application to organize themselves and their own learning processes to reflect and decide questions in front of a broad education background to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses
Credit points	6

	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about aircraft cabin systems and cabin operations. A basic understanding of technological and systems engineering effort to maintain an artificial but comfortable and safe travel and working environment at cruising altitude is to be achieved.	
Content	The course provides a comprehensive overview of current technology and cabin systems in modern passenger aircraft. The Fulfillment of requirements for the cabin as the central system of work are covered on the basis of the topics comfort, ergonomics, human factors, operational processes, maintenance and energy supply: • Materials used in the cabin • Ergonomics and human factors • Cabin interior and non-electrical systems • Cabin electrical systems and lights • Cabin electronics, communication-, information- and IFE-systems • Cabin and passenger process chains • RFID Aircraft Parts Marking • Energy sources and energy conversion

	The objective of the lecture with the corresponding exercise is to accomplish the prerequisites for the development and integration of complex systems using the example of commercial aircraft and cabin systems. Competences in the systems engineering process, tools and methods is to be achieved. Regulations, guidelines and certification issues will be known. Key aspects of the course are processes for innovation and technology management, system design, system integration and certification as well as tools and methods for systems engineering: • Innovation processes • IP-protection • Technology management • Systems engineering • Aircraft program • Certification issues • Systems development • Safety objectives and fault tolerance • Environmental and operating conditions • Tools for systems engineering • Requirements-based engineering (RBE) • Model-based requirements engineering (MBRE)

Admission Requirements	None
Recommended Previous Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
	The students are able to demonstrate their detailed knowledge in the field of Aircraft System Engineering. They can exemplify the state of technology and application and discuss critical in the context of actual problems and general conditions of science and society.
Knowledge	The students can develop solving strategies and approaches for fundamental and practic problems in Aircraft Systems Engineering. They may apply theory based procedures ar integrate safety-related, ecological, ethical, and economic view points of science and society
Skills	Scientific work techniques that are used can be described and critically reviewed. The students are able to independently select methods for the project work and to justify th choice. They can explain how these methods relate to the field of work and how the context application has to be adjusted. General findings and further developments may essentially b outlined.
Personal Competence	
Competence	
Social Competence	The students are able to condense the relevance and the structure of the project work, the work steps and the sub-problems for the presentation and discussion in front of a bigg group. They can lead the discussion and give a feedback on the project to their colleagues.
Autonomy	Die Studierenden sind fähig, die zur Bearbeitung der Projektarbeit notwendige Arbeitsschritte und Abläufe selbständig unter Berücksichtigung vorgegebener Fristen z planen und zu dokumentieren. Hierzu gehört, dass sie sich aktuelle wissenschaftlich Informationen zielorientiert beschaffen können. Ferner sind sie in der Lage, bei Fachexperte Rückmeldungen zum Arbeitsfortschritt einzuholen, um hochwertige, auf den Stand vo Wissenschaft und Technik bezogene Arbeitsergebnisse zu erreichen.

Content	Avionics are all kinds off flight electronics. Today there is no aircraft system function without avionics, and avionics are one main source of innovation in aerospace industry. Since many system functions are highly safety critical, the development of avionics hardware and software underlies mandatory constraints, technics, and processes. It is inevitable for system developers and computer engineers in aerospace industry to understand and master these. This lecture teaches the risks and techniques of developing safety critical hardware and software; major avionics components; integration; and test with a practical orientation. A focus is on Integrated Modular Avionics (IMA). The lecture is accompanied by a mandatory and laboratory exercises. Content: 1. Introduction and History 2. Flight Control 3. Hardware 4. I/O und Bus Systems 5. Software 6. Process und Certification 7. Cockpit und Displays 8. Integrated Modular Avionics I 9. Integrated Modular Avionics II 10. Design of IMA Systems 11. Configuration of IMA Systems 12. Verification and Test 13. Integration 14. Space avionics

Admission Requirements	None			
Recommended Previous Knowledge	 Fundamental stochastics Basic understanding of computer networks and/or communication technologies i beneficial 			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students are able to describe the principles and structures of communication networks i detail. They can explain the formal description methods of communication networks and the protocols. They are able to explain how current and complex communication networks wor and describe the current research in these examples.			
Skills	Students are able to evaluate the performance of communication networks using the learner methods. They are able to work out problems themselves and apply the learned method They can apply what they have learned autonomously on further and new communication networks.			
Personal Competence				
Social Competence	Students are able to define tasks themselves in small teams and solve these problem			
Autonomy	Students are able to obtain the necessary expert knowledge for understanding th functionality and performance capabilities of new communication networks independently.

Content	In the course necessary basic stochastics and the discrete event simulation are introduced. Also simulation models for communication networks, for example, traffic models, mobility models and radio channel models are presented in the lecture. Students work with a simulation tool, where they can directly try out the acquired skills, algorithms and models. At the end of the course increasingly complex networks and protocols are considered and their performance is determined by simulation.

Cycle	WiSe
Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about tasks and measures for protection against attacks on the security of the commercial air transport system. Tasks and measures will be elicited in the context of the three system components man, technology and organization. The course teaches the basics of aviation security. Aviation security is a necessary prerequisite for an economically successful air transport system. Risk management for the entire system can only be successful in an integrated approach, considering man, technology and organization: • Historical development • The special role of air transport • Motive and attack vectors • The human factor • Threats and risk • Regulations and law • Organization and implementation of aviation security tasks • Passenger and baggage checks • Cargo screening and secure supply chain • Safety technologies

Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about tasks and measures for protection against attacks on the security of the commercial air transport system. Tasks and measures will be elicited in the context of the three system components man, technology and organization. The course teaches the basics of aviation security. Aviation security is a necessary prerequisite for an economically successful air transport system. Risk management for the entire system can only be successful in an integrated approach, considering man, technology and organization: • Historical development • The special role of air transport • Motive and attack vectors • The human factor • Threats and risk • Regulations and law • Organization and implementation of aviation security tasks • Passenger and baggage checks • Cargo screening and secure supply chain • Safety technologies

Educational Objectives	After taking part success	fully, students	have reached	the following lea	rning resul	ts
Professional Competence						
Knowledge	Embedded systems can be defined as information processing systems embedded inter enclosing products. This course teaches the foundations of such systems. In particular, it deal with an introduction into these systems (notions, common characteristics) and the specification languages (models of computation, hierarchical automata, specification of distributed systems, task graphs, specification of real-time applications, translations betwee different models). Another part covers the hardware of embedded systems: Sonsors, A/D and D/A converters real-time capable communication hardware, embedded processors, memories, energi dissipation, reconfigurable logic and actuators. The course also features an introduction into real-time operating systems, middleware and real-time scheduling. Finally, th implementation of embedded systems using hardware/software co-design (hardware/software partitioning, high-level transformations of specifications, energy-efficient realizations					
Skills	compilers for embedded processors) is covered. After having attended the course, students shall be able to realize simple embedded systems The students shall realize which relevant parts of technological competences to use in order to obtain a functional embedded systems. In particular, they shall be able to compare different models of computations and feasible techniques for system-level design. They shall be able to judge in which areas of embedded system design specific risks exist.

Specialization Aircraft Systems

TUHH

By specializing in Aircraft Systems Engineering students learn how to work on complex system design problems in an analytical and methodical way. They are deepening existing and getting new competences in the field of control design, simulation, system modelling and other parts of system design. Choosing an open module allows students furthermore to participate in various lectures in the field of aviation.

Module M0846: Control Systems Theory and Design

Courses							
Title						Hrs/wk	СР
Control Systems Theory and Design (L0656)			Lecture		2	4	
Control Systems Theory and Design (L0657)				Recitation Sec	ction (small)	2	2
Module Responsible	Prof. Her	bert Werner					
Admission Requirements	None						
Recommended Previous Knowledge	Introduction to Control Systems						
Educational Objectives	After taking part successfully, students have reached the following learning results						
Professional Competence							
Knowledge	 Students can explain how linear dynamic systems are represented as state space models; they can interpret the system response to initial states or external excitation as trajectories in state space They can explain the system properties controllability and observability, and their relationship to state feedback and state estimation, respectively They can explain the significance of a minimal realisation They can explain observer-based state feedback and how it can be used to achieve tracking and disturbance rejection They can explain the z-transform and its relationship with the Laplace Transform They can explain state space models and transfer function models of discrete-time systems They can explain the experimental identification of ARX models of dynamic systems, and how the identification problem can be solved by solving a normal equation They can explain how a state space model can be constructed from a discrete-time impulse response 						
Skills	 Students can transform transfer function models into state space models and viversa They can assess controllability and observability and construct minimal realisations They can design LQG controllers for multivariable plants They can carry out a controller design both in continuous-time and discrete-tir domain, and decide which is appropriate for a given sampling rate They can identify transfer function models and state space models of dynamic syster from experimental data They can carry out all these tasks using standard software tools (Matlab Cont Toolbox, System Identification Toolbox, Simulink) 						
Personal Competence							

Social Competence	Students can work in small groups on specific problems to arrive at joint solutions.							
	Students can obtain information from provided sources (lecture notes, software documentation, experiment guides) and use it when solving given problems.							
Autonomy	They can assess their knowledge in weekly on-line tests and thereby control their learning progress.

Educational Objectives	After taking part successfully, students have re	eached the following lea	rning result	3
Professional Competence				
Knowledge	Students know the different kinds of air conditioning systems for buildings and mobile applications and how these systems are controlled. They are familiar with the change of state of humid air and are able to draw the state changes in a h1+x,x-diagram. They are able to calculate the minimum airflow needed for hygienic conditions in rooms and can choose suitable filters. They know the basic flow pattern in rooms and are able to calculate the air velocity in rooms with the help of simple methods. They know the principles to calculate an air duct network. They know the different possibilities to produce cold and are able to draw these processes into suitable thermodynamic diagrams. They know the criteria for the assessment of refrigerants.			
Skills	Students are able to configure air condition They are able to calculate an air duct networ tasks, regarding natural heat sources and he into practice. They are able to perform scientif	k and have the ability to eat sinks. They can trans	perform sim sfer researc	ple planning h knowledge
Personal Competence	The students are able to discuss in small grou	ips and develop an appr	oach.	
Social Competence Autonomy	Students are able to define independently knowledge as well as to find ways to use the l	-	nowledge f	rom existing

Title Optimal and Robust Conti Optimal and Robust Conti		Typ Lecture Recitation Section (small)	Hrs/wk 2 2	CP 3 3
	Prof. Herbert Werner			
Admission Requirements	None			
Recommended Previous Knowledge	 Classical control (frequency response, root locus) State space methods Linear algebra, singular value decomposition 			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	 Students can explain the significance of the matrix Riccati equation for the solution of LQ problems. They can explain the duality between optimal state feedback and optimal state estimation. They can explain how the H2 and H-infinity norms are used to represent stability and performance constraints. They can explain how an LQG design problem can be formulated as special case of an H2 design problem. They can explain how model uncertainty can be represented in a way that lends itsel to robust controller design They can explain how - based on the small gain theorem - a robust controller car guarantee stability and performance for an uncertain plant. They understand how analysis and synthesis conditions on feedback loops can be represented as linear matrix inequalities. 			
Skills	 Students are capable of designing and tuning LQG controllers for multivariable models. They are capable of representing a H2 or H-infinity design problem in the form generalized plant, and of using standard software tools for solving it. They are capable of translating time and frequency domain specifications for caloops into constraints on closed-loop sensitivity functions, and of carrying out a m sensitivity design. They are capable of constructing an LFT uncertainty model for an uncertain sy and of designing a mixed-objective robust controller. They are capable of formulating analysis and synthesis conditions as linear minequalities (LMI), and of using standard LMI-solvers for solving them. They can carry out all of the above using standard software tools (Matlab robust controllox). 		the form of ons for contr g out a mixe ertain system s linear mate	
Personal Competence

fter taking part successfully, students have reached the following learning results
 Students are able to find their way through selected special areas within systems engineering, air transportation system and material science Students are able to explain basic models and procedures in selected special areas. Students are able to interrelate scientific and technical knowledge.
tudents are able to apply basic methods in selected areas of engineering.
tudents can chose independently, in which fields they want to deepen their knowledge and kills through the election of courses.

Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about tasks and measures for protection against attacks on the security of the commercial air transport system. Tasks and measures will be elicited in the context of the three system components man, technology and organization. The course teaches the basics of aviation security. Aviation security is a necessary prerequisite for an economically successful air transport system. Risk management for the entire system can only be successful in an integrated approach, considering man, technology and organization: • Historical development • The special role of air transport • Motive and attack vectors • The human factor • Threats and risk • Regulations and law • Organization and implementation of aviation security tasks • Passenger and baggage checks • Cargo screening and secure supply chain • Safety technologies

Examination Form	Klausur			
Examination duration and scale	190 Minuten			
Lecturer	Prof. Ralf God			
Language	DE			
Cycle	SoSe			
Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge for development, electronic packaging technology and the production of electronic components for safety-critical applications. On an item, component and system level it is shown, how the specified safety objectives for electronics in aircraft can be achieved. Current challenges, such as availability of components, component counterfeiting and the use of components off-the-shelf (COTS) will be discussed: Survey of the role of electronics in aviation System levels: From silicon to mechatronic systems Semiconductor components, assemblies, systems Challenges of electronic packaging technology (AVT) System integration in electronics: Requirements for AVT Methods and techniques of AVT Error patterns for assemblies and avoidance of errors Reliability analysis for printed circuit boards (PCBs) Reliability of Avionics COTS, ROTS, MOTS and the F ³ I concept Future challenges for electronics

Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge of computer and communication technology in electronic systems in the cabin and in aircraft. For the system engineer the strong interaction of software, mechanical and electronic system components nowadays requires a basic understanding of cabin electronics and avionics. The course teaches the basics of design and functionality of computers and data networks. Subsequently it focuses on current principles and applications in integrated modular avionics (IMA), aircraft data communication networks (ADCN), cabin electronics and cabin networks: • History of computer and network technology • Layer model in computer technology • Computer architectures (PC, IPC, Embedded Systems) • BIOS, UEFI and operating system (OS) • Programming languages (machine code and high-level languages) • Applications and Application Programming Interfaces • External interfaces (serial, USB, Ethernet) • Layer model in network technology • Network topologies • Network components • Bus access procedures • Image (IMA) and Aircraft Data Communication Networks (ADCN) • Cabin electronics and cabin networks

Content	 Avionics are all kinds off flight electronics. Today there is no aircraft system function without avionics, and avionics are one main source of innovation in aerospace industry. Since many system functions are highly safety critical, the development of avionics hardware and software underlies mandatory constraints, technics, and processes. It is inevitable for system developers and computer engineers in aerospace industry to understand and master these. This lecture teaches the risks and techniques of developing safety critical hardware and software; major avionics components; integration; and test with a practical orientation. A focus is on Integrated Modular Avionics (IMA). The lecture is accompanied by a mandatory and laboratory exercises. Content: 1. Introduction and History 2. Flight Control 3. Hardware 4. I/O und Bus Systems 5. Software 6. Process und Certification 7. Cockpit und Displays 8. Integrated Modular Avionics II 9. Integrated Modular Avionics II 10. Design of IMA Systems 11. Configuration of IMA Systems 12. Verification and Test 13. Integration 14. Space avionics

Specialization Cabin Systems

In the specialization in cabin systems, students learn to systematically deal with issues related to the development of aircraft cabin systems, the use of these systems and their application in an operational environment. The aircraft cabin with the cabin management system represents the central working system of an airline during passenger transport. The focus of the specialization is the design of electronic cabin and communication systems using the methodology of Model-Based Systems Engineering (MBSE). Environmental control systems, acoustics, design methods related to composite materials and for integrated product development are further important aspects in the specialization for aircraft cabin development. Airport operations and operations of an airline with respective procedures and systems round off the context of the aircraft cabin. Students have broad knowledge on development methods for complex systems. The can draft requirements, functions and architectures for hardware- and software-based systems, and model and simulate solutions. They know about appropriate tools and methods and master the overall system development process from system design via system implementation and system integration, right up to validation and verification.

Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge	The students possess an in-depth knowledge in acoustics regarding acoustic waves, noise protection, and psycho acoustics and are able to give an overview of the corresponding theoretical and methodical basis.		
Skills	The students are capable to handle engineering problems in acoustics by theory-based application of the demanding methodologies and measurement procedures treated within the module.		
Personal Competence			
Social Competence	Students can work in small groups on specific problems to arrive at joint solutions.		
Autonomy	The students are able to independently solve challenging acoustical problems in the areas treated within the module. Possible conflicting issues and limitations can be identified and the results are critically scrutinized.

Automation and Simulation Automation and Simulation		Lecture Recitation Section (large)	3	3 3
Module Responsible			_	0
Admission Requirements				
Recommended Previous Knowledge	BSc Mechanical Engineering or similar			
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students can describe the structure an the function of process computers, the corresponding components, the data transfer via bus systems an programmable logic computers . They can describe the basich principle of a numeric simulation and the corresponding parameters. Thy can explain the usual method to simulate the dynamic behaviour of three-phase machines.			
Skills	Students can describe and design simple controllers using established methodes. They are able to assess the basic characterisitcs of a given automation system and t evaluate, if it is adequate for a given plant. They can modell and simulate technical systems with respect to their dynamical behaviou and can use Matlab/Simulink for the simulation. They are able to applay established methods for the caclulation of the dynamical behaviour of three-phase machines.			
	Teamwork in small teams. Students are able to identify the need of methocic analysises in the field of automatio systems, to do these analysisis in an adequate manner und to evaluate the results critically.

Admission Requirements	
Recommended Previous Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	 Students are able to find their way through selected special areas within systems engineering, air transportation system and material science Students are able to explain basic models and procedures in selected special areas. Students are able to interrelate scientific and technical knowledge.
Skills	Students are able to apply basic methods in selected areas of engineering.
Personal Competence Social Competence	
Autonomy	Students can chose independently, in which fields they want to deepen their knowledge and skills through the election of courses.
Workload in Hours	Depends on choice of courses

	Fundamentals of Anisotropic Elasticity
	Displacements, strains and stresses; Equilibrium equations; Kinematics; Hooke's generalized law
	Behaviour of a single laminate layer
	Material law of a single laminate layer; Full anisotropy and coupling effects; Material symmetries; Engineering constants; Plane state of stress; Transformation rules
	Fundamentals of Micromechanics of a laminate layer
	Representative unit cell; Determination of effective material constants; Effective stiffness properties of a single layer
	Classical Laminate Plate Theory
	Notations and laminate code; Kinematics and displacement field; Strains and stresses, stress resultants; Constitutive equations and coupling effects; Special laminates and their behavior;

	Effective laminate properties
Content	Strength of Laminated Plates
	Fundamental concept; Phenomenological failure criteria: maximum stresses, maximum strains, Tsai-Hill, Tsai-Wu, Puck, Hashin
	Bending of Composite Laminated Plates
	Differential Equations; Boundary Conditions; Navier-type solutions; Lévy-type solutions
	Stress Concentration Problems
	Free-edge effects; Stress concentrations at holes, cracks, delaminations; Aspects of failure analysis
	Stability of Thin-Walled Composite Structures
	Buckling of anisotropic plates and shells; Influence of loading conditions; Influence of boundary conditions; Exact transcendental solutions and their evaluation; Buckling of stiffened composite plates; Minimum stiffness requirements; Local buckling of stiffener profiles
	Written exercise (report required)
	Assessment of a thin-walled composite laminated beam taking several different dimensioning criteria into account

Language	DE	
Cycle	WiSe	
Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about tasks and measures for protection against attacks on the security of the commercial air transport system. Tasks and measures will be elicited in the context of the three system components man, technology and organization. The course teaches the basics of aviation security. Aviation security is a necessary prerequisite for an economically successful air transport system. Risk management for the entire system can only be successful in an integrated approach, considering man, technology and organization: • Historical development • The special role of air transport • Motive and attack vectors • The human factor • Threats and risk • Regulations and law • Organization and implementation of aviation security tasks • Passenger and baggage checks • Cargo screening and secure supply chain • Safety technologies

Structure and properties of Design with fibre-polymer	of fibre-polymer-composites (L1894) -composites (L1893)	Lecture Lecture	2 2	3 3
Module Responsible	Prof. Bodo Fiedler			
Admission Requirements	None			
Recommended Previous Knowledge	Basics: chemistry / physics / materials s	cience		
Educational Objectives	After taking part successfully, students	nave reached the follow	ring learning resu	lts
Professional Competence				
	Students can use the knowledge of file play (fiber / matrix) and define the nece		. ,	constituents
Knowledge	They can explain the complex relations	hips structure-property	relationship and	
	the interactions of chemical structure of the polymers, their processing with the different fiber types, including to explain neighboring contexts (e.g. sustainability, environmental protection).			
	Students are capable of			
Skills	 using standardized calculation methods in a given context to mechanical propertie (modulus, strength) to calculate and evaluate the different materials. approximate sizing using the network theory of the structural elements implement an evaluate. selecting appropriate solutions for mechanical recycling problems and sizing example. 			
	stiffness, corrosion resistance.			
Personal Competence				
	Students can			
Social Competence	 arrive at funded work results in heterogenius groups and document them. provide appropriate feedback and handle feedback on their own performan constructively. 			
	Students are able to			
	- assess their own strengths and weakr	iesses.		
Autonomy	- assess their own state of learning in specific terms and to define further work steps on this basis.			
	- assess possible consequences of their professional activity.

Recommended Previous Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	The students possess an in-depth knowledge in acoustics regarding room acoustics ar computational methods and are able to give an overview of the corresponding theoretical ar methodical basis.			
Skills	The students are capable to handle engineering problems in acoustics by theory-base application of the demanding computational methods and procedures treated within th module.			
Personal Competence				
Social Competence	Students can work in small groups on specifi	c problems to arrive at jo	int solution	S.
Autonomy	The students are able to independently solve challenging acoustical problems in the areas treated within the module. Possible conflicting issues and limitations can be identified and the results are critically scrutinized.

Content	Lecture The lecture extends and enhances the learned content of the module "Integrated Produ Development and lightweight design" and is based on the knowledge and skills acquire there. Topics of the course include in particular: Methods of product development, Presentation techniques, Industrial Design, Design for variety Modularization methods, Design catalogs, Adapted QFD matrix, Systematic material selection, Assembly oriented design, Construction management CE mark, declaration of conformity including risk assessment, Project management (cost, time, quality) and escalation principles, Development management. Exercise (PBL) In the exercise the content presented in the lecture "Integrated Product Development II" ar methods of product development and design management will be enhanced. Students learn an independently moderated and workshop based approach through indust related practice examples to solve complex and currently existing issues in produ development. They will learn the ability to apply important methods of product development and design management. Besides personal skills, such as teamwork, guiding discussions ar representing work results will be acquired through the workshop based structure of the eve under its own planning and management.

Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
nine meage	The students can evaluate and assess discrete event systems. They can evaluate properties of processes and explain methods for process analysis. The students can compare methods for process modelling and select an appropriate method for actual problems. They can discuss scheduling methods in the context of actual problems and give a detailed explanation of advantages and disadvantages of different programming methods. The students can relate process automation to methods from robotics and sensor systems as well as to recent topics like 'cyberphysical systems' and 'industry 4.0'.				
JANI JANI JANI JANI JANI JANI JANI JANI	The students are able to develop and model processes and evaluate them accordingly. Thi involves taking into account optimal scheduling, understanding algorithmic complexity, an implementation using PLCs.				
Personal Competence Social Competence	The students work in teams to solve problems.				
Autonomy	The students can reflect their knowledge and document the results of their work.

	This course is intended as an introduction to the topics of wave propagation, guiding, sending and receiving as well as Electromagnetic Compatibility (EMC) for graduate engineering students that do not have a formal background in electrical engineering. It will be useful fo engineers that face the technical challenge of transmitting high frequency / high bandwidth data in e.g. medical, automotive, or avionic applications. Both circuit and field concepts o wave propagation and Electromagnetic Compatibility will be introduced and discussed. Topics:
Content	 Fundamental properties and phenomena of electrical circuits Steady-state sinusoidal analysis of electrical circuits Fundamental properties and phenomena of electromagnetic fields and waves Steady-state sinusoidal description of electromagnetic fields and waves Useful microwave network parameters Transmission lines and basic results from transmission line theory Plane wave propagation, superposition, reflection and refraction General theory of waveguides Most important types of waveguides and their properties Numerical techniques and CAD tools for waveguide and antenna design Fundamentals of Electromagnetic Compatibility Coupling mechanisms and countermeasures Shielding, grounding, filtering Standards and regulations EMC measurement techniques

Content	Avionics are all kinds off flight electronics. Today there is no aircraft system function without avionics, and avionics are one main source of innovation in aerospace industry. Since many system functions are highly safety critical, the development of avionics hardware and software underlies mandatory constraints, technics, and processes. It is inevitable for system developers and computer engineers in aerospace industry to understand and master these. This lecture teaches the risks and techniques of developing safety critical hardware and software; major avionics components; integration; and test with a practical orientation. A focus is on Integrated Modular Avionics (IMA). The lecture is accompanied by a mandatory and laboratory exercises. Content: 1. Introduction and History 2. Flight Control 3. Hardware 4. I/O und Bus Systems 5. Software 6. Process und Certification 7. Cockpit und Displays 8. Integrated Modular Avionics I 9. Integrated Modular Avionics I 10. Design of IMA Systems 11. Configuration of IMA Systems 12. Verification and Test 13. Integration 14. Space avionics

Specialization Air Transportation Systems

The degree programme "Air Transportation Systems and Preliminary Aircraft Design" provides a comprehensive understanding of operational aspects of air transport. Further students are educated in aircraft design methods based on operational requirements. The programme competences will extend and intensify the basic compentencies of the bachelor studies by specific methods in design and modelling of air transport systems and and aircraft a spart of it.

As a result graduates will be system analysts being able to design, integrate, model and assess complex systems like air transport including the related technologies.

Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge of computer and communication technology in electronic systems in the cabin and in aircraft. For the system engineer the strong interaction of software, mechanical and electronic system components nowadays requires a basic understanding of cabin electronics and avionics. The course teaches the basics of design and functionality of computers and data networks. Subsequently it focuses on current principles and applications in integrated modular avionics (IMA), aircraft data communication networks (ADCN), cabin electronics and cabin networks: • History of computer and network technology • Layer model in computer technology • Computer architectures (PC, IPC, Embedded Systems) • BIOS, UEFI and operating system (OS) • Programming languages (machine code and high-level languages) • Applications and Application Programming Interfaces • External interfaces (serial, USB, Ethernet) • Layer model in network technology • Network topologies • Network components • Bus access procedures • Image (IMA) and Aircraft Data Communication Networks (ADCN) • Cabin electronics and cabin networks

	 Fundamentals of Anisotropic Elasticity Displacements, strains and stresses; Equilibrium equations; Kinematics; Hooke's generalized law Behaviour of a single laminate layer Material law of a single laminate layer; Full anisotropy and coupling effects; Material symmetries; Engineering constants; Plane state of stress; Transformation rules Fundamentals of Micromechanics of a laminate layer Representative unit cell; Determination of effective material constants; Effective stiffness properties of a single layer Classical Laminate Plate Theory
	Notations and laminate code; Kinematics and displacement field; Strains and stresses, stress resultants; Constitutive equations and coupling effects; Special laminates and their behavior;

	Effective laminate properties
Content	Strength of Laminated Plates
	Fundamental concept; Phenomenological failure criteria: maximum stresses, maximum strains, Tsai-Hill, Tsai-Wu, Puck, Hashin
	Bending of Composite Laminated Plates
	Differential Equations; Boundary Conditions; Navier-type solutions; Lévy-type solutions
	Stress Concentration Problems
	Free-edge effects; Stress concentrations at holes, cracks, delaminations; Aspects of failure analysis
	Stability of Thin-Walled Composite Structures
	Buckling of anisotropic plates and shells; Influence of loading conditions; Influence of boundary conditions; Exact transcendental solutions and their evaluation; Buckling of stiffened composite plates; Minimum stiffness requirements; Local buckling of stiffener profiles
	Written exercise (report required)
	Assessment of a thin-walled composite laminated beam taking several different dimensioning criteria into account

Course L1549: Aviation Security	
Тур	Lecture
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Examination Form	Klausur
Examination duration and scale	90 Minuten
Lecturer	Prof. Ralf God
Language	DE
Cycle	WiSe
Content	The objective of the lecture with the corresponding exercise is the acquisition of knowledge about tasks and measures for protection against attacks on the security of the commercial air transport system. Tasks and measures will be elicited in the context of the three system components man, technology and organization. The course teaches the basics of aviation security. Aviation security is a necessary prerequisite for an economically successful air transport system. Risk management for the entire system can only be successful in an integrated approach, considering man, technology and organization: • Historical development • The special role of air transport • Motive and attack vectors • The human factor • Threats and risk • Regulations and law • Organization and implementation of aviation security tasks • Passenger and baggage checks • Cargo screening and secure supply chain • Safety technologies

Content	In the course the theoretic basics for design optimization and reliability analysis are taught, where the focus is on the application of such methods. The lectures will consist of presentations as well as computer exercises. In the computer exercises, the methods learned will be implemented in Matlab for understanding the practical realization. The following contents will be considered: • Design optimization • Gradient based methods • Genetic algorithms • Optimization with constraints • Topology optimization • Reliability analysis • Stochastic basics • Monte Carlo methods • Semi-analytic approaches • robust design optimization • Robustness measures • Coupling of design optimization and reliability analysis

Content	The lecture extends and enhances the learned content of the module "Integrated Produ Development and lightweight design" and is based on the knowledge and skills acquire there. Topics of the course include in particular: • Methods of product development, • Presentation techniques, • Industrial Design, • Design for variety • Modularization methods, • Design catalogs, • Adapted QFD matrix, • Systematic material selection, • Assembly oriented design, Construction management		
	 Technical Supply Chain Management. Exercise (PBL) In the exercise the content presented in the lecture "Integrated Product Development II" are methods of product development and design management will be enhanced. Students learn an independently moderated and workshop based approach through indust related practice examples to solve complex and currently existing issues in product development. They will learn the ability to apply important methods of product development autonomous and acquire further expertise in the field of integrate product development. Besides personal skills, such as teamwork, guiding discussions are representing work results will be acquired through the workshop based structure of the evel under its own planning and management.

Professional Competence			
Knowledge	 waveguides and antennas as well as of Electromagnetic Compatibility. Specific topics are: Fundamental properties and phenomena of electrical circuits Steady-state sinusoidal analysis of electrical circuits Fundamental properties and phenomena of electromagnetic fields and waves Steady-state sinusoidal description of electromagnetic fields and waves Useful microwave network parameters Transmission lines and basic results from transmission line theory Plane wave propagation, superposition, reflection and refraction General theory of waveguides Most important types of waveguides and their properties Radiation and basic antenna parameters Most important types of antennas and their properties Numerical techniques and CAD tools for waveguide and antenna design Fundamentals of Electromagnetic Compatibility Coupling mechanisms and countermeasures Shielding, grounding, filtering Standards and regulations EMC measurement techniques 		
Skills	properties. They can apply results and strategies from the field of Electromagne Compatibility to the development of electrical components and systems.		
Personal Competence			
Social Competence	Students are able to work together on subject related tasks in small groups. They are able present their results effectively in English (e.g. during small group exercises).		
Autonomy	Students are capable to gather information from subject related, professional publications and relate that information to the context of the lecture. They are able to make a connection between their knowledge obtained in this lecture with the content of other lectures (e.g. theory of electromagnetic fields, fundamentals of electrical engineering / physics). They can discuss technical problems and physical effects in English.		
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70		

Credit points	6
Studienleistung	None
Examination	
Examination duration and scale	45 min
Assignment for the Following Curricula	

Course L1669: Introdu	ction to Waveguides, Antennas, and Electromagnetic Compatibility
Тур	Lecture
Hrs/wk	3
СР	4
Workload in Hours	Independent Study Time 78, Study Time in Lecture 42
Lecturer	Prof. Christian Schuster
Language	DE/EN
Cycle	WiSe
Content	This course is intended as an introduction to the topics of wave propagation, guiding, sending, and receiving as well as Electromagnetic Compatibility (EMC) for graduate engineering students that do not have a formal background in electrical engineering. It will be useful for engineers that face the technical challenge of transmitting high frequency / high bandwidth data in e.g. medical, automotive, or avionic applications. Both circuit and field concepts of wave propagation and Electromagnetic Compatibility will be introduced and discussed. Topics: - Fundamental properties and phenomena of electrical circuits - Steady-state sinusoidal analysis of electrical circuits - Steady-state sinusoidal analysis of electromagnetic fields and waves - Steady-state sinusoidal description of electromagnetic fields and waves - Useful microwave network parameters - Transmission lines and basic results from transmission line theory - Plane wave propagation, superposition, reflection and refraction - General theory of waveguides - Most important types of waveguides and their properties - Numerical techniques and CAD tools for waveguide and antenna design - Fundamentals of Electromagnetic Compatibility - Coupling mechanisms and countermeasures - Shielding, grounding, filtering - Standards and regulations - EMC measurement techniques

Thesis

In their master's thesis students work independently on research-oriented problems, structuring the task into different sub-aspects and apply systematically the specialized competences they have acquired in the course of the study program.

Special importance is attached to a scientific approach to the problem including, in addition to an overview of literature on the subject, its classification in relation to current issues, a description of the theoretical foundations, and a critical analysis and assessment of the results.

Courses		
Title	Typ Hrs/wk	СР
Module Responsible	Professoren der TUHH	
Admission Requirements		examination
Recommended Previous Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	3
Professional Competence		
Knowledge	 The students can use specialized knowledge (facts, theories, and meth subject competently on specialized issues. The students can explain in depth the relevant approaches and terminolo or more areas of their subject, describing current developments and taking position on them. The students can place a research task in their subject area in its context a and critically assess the state of research. 	ogies in on g up a critica
Skills	 The students are able: To select, apply and, if necessary, develop further methods that are suitable the specialized problem in question. To apply knowledge they have acquired and methods they have learnt in their studies to complex and/or incompletely defined problems in a solution way. To develop new scientific findings in their subject area and subject them assessment. 	he course c tion-oriente
Personal Competence		
Social Competence	 Students can Both in writing and orally outline a scientific issue for an expert audience understandably and in a structured way. Deal with issues competently in an expert discussion and answer them that is appropriate to the addressees while upholding their own assessed. 	in a manne

	viewpoints convincingly.
Autonomy	 Students are able: To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. To apply the techniques of scientific work comprehensively in research of their own.
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
