Thesis	
Module M-002: Master Thesis	77

Program description

Content

Core qualification

Module M0502: Business	9 Management
Module M0523: Business	a management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge Skills	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Personal Competence Social Competence Autonomy	
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module M0524: Nontechnical Elective Complementary Courses for Master		
Module Responsible	Dagmar Richter	
Admission Requirements	None	
Recommended Previous	None	
Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledae	The Nontechnical Academic Programms (NTA)	

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, selfmanagement, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- explain specialized areas in context of the relevant non-technical disciplines.
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic and specific methods of the said scientific disciplines,
- aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner.
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to

Personal Competence

Social Competence	Personal Competences (Social Skills)
	Students will be able
	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomu	Devenuel Competences (Colf religions)
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
	to digatile the medical characteristic and an object central factor and an

Courses	
Title	Typ Hrs/wk CP
Multiscale Materials (L1659)	Lecture 6 6
Module Responsible	Prof. Gerold Schneider
Admission Requirements	Mandatory lectures of the first semester of the master course "materials science"
Recommended Previous	Fundamentals in physics and chemistry, Fundamentals and enhanced fundamentals in materials science, Advanced mathematics, Fundamentals
Knowledge	of the theory elasticity
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	The master students will be able to explain
	the fundamental chemical and physical properties of metals, ceramics and polymers.
	the correlation of chemical and physical phenomena on the atomic, meso and macroscale and its consequences for the macroscopic properties
	of materails.
	The master students will then be able understand the dependence of the macroscopic material properties on the underlying hierarchical levels.
Skills	After attending this lecture the students can
	perform materials design for multiscale materials.
Personal Competence	
Social Competence	The student has an astonishing knowledge in materials properties which demands both, expertise in chemistry, physics and materials science.
	This makes him to an outstanding discussion partner who will be able to understand the scientific arguments of "both sides". Up to now, such an
	education is hard to find at universities.
Autonomy	The students are able to
	assess their own strengths and weaknesses.
	define tasks independently.

Cycle	WiSe
Content	The materials discussed in this lecture differ from "conventional" ones due to their individual hierarchic microstructure. In conventional microstructure design, the morphology is adjusted, for instance, by thermal treatment and concurrent mechanical deformation. The material is continually and steadily optimized by small changes in structure or chemical composition, also in combination with self-organization processes (precipitation alloys, ceramic glasses, eutectic structures).
	The presented materials consist of functionalized elementary functional units based on polymers, ceramics, metals and carbon nanotubes (CNTs), which are used to create macroscopic hierarchical material systems, whose characteristic lengths range from the nanometer to the centimeter scale. These elementary functional units are either core-shell structures or cavities in metals created by alloy corrosion and subsequent polymer filling.
	Three classes of material systems will be presented:
	First, hierarchically structured ceramic/metal-polymer material systems similar to naturally occurring examples, namely nacre (1 hierarchical level), enamel (3 hierarchical levels) and bone (5 hierarchical levels) will be discussed. Starting with an elementary functional unit consisting of ceramic nanoparticles with a polymeric coating, a material is created in which on each hierarchical level, "hard" particles, made of the respective lower hierarchical level, are present in a soft polymer background. The resulting core-shell structure on each hierarchical level is the fundamental difference compared to a compound material made of rigid interpenetrating ceramic or metallic networks.
	The second material system is based on nanoporous gold, which acts as a prototypical material for new components in light weight construction with simultaneous actuator properties. Their production and resulting length-scale specific mechanical properties will be explained. Furthermore, related scale-spanning theoretical models for their mechanical behavior will be introduced. This covers the entire scale from the electronic structure on the atomic level up to centimeter-sized macroscopic samples.
	The third material system discussed in the lecture are novel hierarchical nanostructured materials based on thermally stable ceramics and metals for high-temperature photonics with potential use in thermophotovoltaic systems (TPVs) and thermal barrier coatings (TBCs). Direct and inverted 3D-photonic crystal structures (PhCs) as well as novel optically hyperbolic media, in particular, are worthwhile noting. Due to their periodicity and diffraction index contrast, PhCs exhibit a photonic band structure, characterized by photonic band gaps, areas of particularly high photonic densities of states and special dispersion relations. The presented properties are to be used to reflect thermal radiation in TBCs in a strong and directed manner, as well as to link radiation effectively and efficiently in TPVs.

Course L1662: Dislocation Theory	of Plasticity
Тур	Lecture
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Erica Lilleodden
Language	DE/EN
Cycle	SoSe
Content	This class will cover the principles of dislocation theory from a physical metallurgy perspective, providing a fundamental understanding of the relations between the strength and of crystalline solids and distributions of defects.
	We will review the concept of dislocations, defining terminology used, and providing an overview of important concepts (e.g. linear elasticity, stress-strain relations, and stress transformations) for theory development. We will develop the theory of dislocation plasticity through derived stress-strain fields, associated self-energies, and the induced forces on dislocations due to internal and externally applied stresses. Dislocation structure will be discussed, including core models, stacking faults, and dislocation arrays (including grain boundary descriptions). Mechanisms of dislocation multiplication and strengthening will be covered along with general principles of creep and strain rate sensitivity. Final topics will include non-FCC dislocations, emphasizing the differences in structure and corresponding implications on dislocation mobility and macroscopic mechanical behavior; and dislocations in finite volumes.
Literature	Vorlesungsskript Aktuelle Publikationen Bücher: Introduction to Dislocations, by D. Hull and D.J. Bacon Theory of Dislocations, by J.P. Hirth and J. Lothe Physical Metallurgy, by Peter Hassen

Module M1199: Advanced	Functional Materials			
Courses				
Title		Тур	Hrs/wk	СР
Advanced Functional Materials (L1625)		Lecture	2	6
Module Responsible	Prof. Patrick Huber			
Admission Requirements	none.			
Recommended Previous	Fundamentals of Materials Science (I and II)			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following	owing learning results		
Professional Competence				
Knowledge	The students will be able to explain the properties of advance	ed materials along with their applica	tions in technology, in parti	cular metallic, ceramic,
	polymeric, semiconductor, modern composite materials (bior	materials) and nanomaterials.		
Skille	The students will be able to select material configurations ac	ecording to the technical needs and	if necessary to design new	materials considering
Okins	architectural principles from the micro- to the macroscale. T			
	them to select optimum materials combinations depending o	•	iew on modern materials s	olonoo, willon onables
	3 · · · · · · · · · · · · · · · · · · ·			
Personal Competence				
Social Competence	The students are able to present solutions to specialists and	to develop ideas further.		
Autonomy	The students are able to			
	 assess their own strengths and weaknesses. 			
	 define tasks independently. 			
Workload in Hours	Independent Study Time 152, Study Time in Lecture 28

Courses	
Title	Typ Hrs/wk CP
Module Responsible	Prof. Jörg Weißmüller
Admission Requirements	open to all students of the degree course
Recommended Previous	knowledge of Materials Science fundamentals
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	detailed knowledge in the area of the project topic
Skills	 independent familiarization with the scientific context of a specified topic guided execution of scientific experiment, computation or simulation data analysis and scientific discussion of results written presentation of results in a protocol oral presentation of the project results
Personal Competence	
Social Competence	Students are able to discuss scientific results with specific target groups, to document results in a written form and to present them orally.
Autonomy	
Workload in Hours	Independent Study Time 360, Study Time in Lecture 0
Credit points	12
Examination	Project (accord. to Subject Specific Regulations)
Examination duration and scale	
Assignment for the Following Curricula	

Specialization Engineering Materials

Students learn in the Engineering Materials specialization the evaluation of the different materials in the technology-oriented environment.

They gain knowledge about process planning as well as managing of projects or personnel. Students are able to evaluate and make decisions on materials, industrial production, quality assurance and failure analysis.

Module M1202: Design wi	th Polymers and Composites

Admission Requirements				
Recommended Previous Knowledge	Structure and Properties of Polymers			
Kilowieuge	Structure and Properties of Composites			
Educational Objectives	After taking part successfully, students have reached the follow	ing learning results		
Professional Competence				
Knowledge	Students can reflect the fundamentals of design elements	of fiber composites and plastics.		
	They can explain the complex relationships of loads on Po	lymer- and fiber composite structu	res.	
	The interactions of processing technologies, design an	d strength (calculation), includin	g to explain contexts	s (e.g. sustainability,
	environment).			
Skills	Students are capable of using standardized calculation me	thods in a given context to solve		
	- Problem such as Layer design and to solve manufacturin	g technology for which non-standa	rd solutions exist.	
	- Approximate sizing using the network theory of the structural elements implement and evaluate.			
	- For their constructive problem select appropriate design elements and dimensioning example Connection technology, sandwich technology.			
	- In the field of thermoplastic construction elements su performance appropriate.	ch as Film hinge to assess sna	ap with manufacturing	technologies, costs,
Personal Competence				
Social Competence	Students can,			
	- arrive at work results in groups and document them.			
	- provide appropriate feedback and handle feedback on the	ir own performance constructively.		
Autonomy	Students are able to,			
	the transmitter and another and			
	- assess their own strengths and weaknesses			
	- assess their own state of learning in specific terms and to	define further work steps on this	basis guided by teach	ers.
		access the state of loaning in epocine terms and to define father work steps of this basis guided by teachers.		
	- assess possible consequences of their professional activ	ity.

Course L0500: Joining of Polymer-	- Metal Lightweight Structures	
	Lecture	
Hrs/wk	2	
СР	2	
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28	
Lecturer	Prof. Sergio Amancio Filho	
Language	EN	
Cycle	WiSe	
	Recommended Previous Knowledge:	
	Fundamentals of Materials Science and Engineering	
	Basic Knowledge of Science and Technology of Welding and Joining	
	Contents:	
	The lecture and the related laboratory exercises intend to provide an insight on advanced joining technologies for polymer-metal lightweight structures used in engineering applications. A general understanding of the principles of the consolidated and new technologies and its main fields of applications is to be accomplished through theoretical and practical lectures:	
	Theoretical Lectures:	
	- Review of the relevant properties of Lightweight Alloys, Engineering Plastics and Composites in Joining Technology	
	- Introduction to Welding of Lightweight Alloys, Thermoplastics and Fiber Reinforced Plastics	
	- Mechanical Fastening of Polymer-Metal Hybrid Structures	
	- Adhesive Bonding of Polymer-Metal Hybrid Structures	
	- Fusion and Solid State Joining Processes of Polymer-Metal Hybrid Structures	
	- Hybrid Joining Methods and Direct Assembly of Polymer-Metal Hybrid Structures	
	Laboratory Exercises (will be offered at Helmholtz-Zentrum Geesthacht as a 2-3 days compact course)	
	- Joining Processes: Introduction to state-of-the-art friction-based spot welding and joining technologies (Friction Riveting, Friction Spot Joining and Injection Clinching Joining)	
	- Introduction to metallographic specimen preparation, optical microscopy and mechanical testing of polymer-metal joints	
	Learning Outcomes:	
	After successful completion of this unit, students should be able to understand the principles of welding and joining of polymer-metal lightweight structures as well as their application fields.

Content	Introduction to ceramic processing with emphasis on advanced structural ceramics. The course focus predominatly on powder-based processing, e.g. "powder-metauurgical techniques and sintering (soild state and liquid phase). Also, some aspects of glass and cement science as well as new developments in powderless forming techniques of ceramics and ceramic composites will be addressed Examples will be discussed in order to give engineering students an understanding of technology development and specific applications of ceramic components.		
	Content: 1. Introduction		
	Inhalt: 2. Raw materials		
	3. Powder fabrication		
	4. Powder processing		
	5. Shape-forming processes		
	6. Densification, sintering		
	7. Glass and Cement technology

Metallic Light-weight Materials (L1660)		Lecture	2	4
Materials Testing (L0949)	,	Lecture	2	2
Module Responsible	Prof. Karl-Ulrich Kainer			
Admission Requirements				
Recommended Previous	Basics in chemistry / physics / material science			
Knowledge	After the large most accessorially, and another house years had the fall accions	la avaina va avilta		
Educational Objectives Professional Competence		learning results		
Knowledge				
	- to use the basics of metallic lightweight structural materials			
	- to apply selection criteria known for metallic lightweight structural	material		
	- to select suitable test methods and analysis methods for the chara-	acterisation of the materials		
	- to understand complex correlation between processing-microstruc	cture-properties in example	es	
	- to show application potential and typical examples of use			
Skills	Students are able			
	- to weigh pros and cons of the different material groups,			
	- to make decisions on the choice of suitable materials for application	on in material lightweight d	esign,	
	- to evaluate the property potential of the materials and to assess th	e different materials,		
	- to select suitable solutions for material related prob corrosion and processability	olems and for designing	ng of parts, e.g., med	hanical properties
Personal Competence				
Social Competence	Students are able to			
	- arrive at work results in groups, document and evaluate them,			
	- provide appropriate feedback and handle external feed	back on their own perf	ormance constructively.	
Autonomy	Students are able to			
	- assess their own strengths and weaknesses,			
	- assess their own state of learning in specific terms and to define f	rurther work steps on this ba	asis guided by lecturers,	
	- assess possible consequences of their professional a	ctivity		
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56			
Credit points	6			
Examination	Written exam			
Examination duration and scale	120 min		-

Тур	Lecture
Hrs/wk	2
СР	4
Workload in Hours	Independent Study Time 92, Study Time in Lecture 28
Lecturer	Prof. Karl-Ulrich Kainer
Language	DE
Cycle	
Content	Lightweight construction
	- Structural lightweight construction
	- Material lightweight construction
	- Choice criteria for metallic lightweight construction materials
	Steel as lightweight construction materials
	- Introduction to the fundamentals of steels
	- Modern steels for the lightweight construction
	- Fine grain steels

- High-strength low-alloyed steels
- Multi-phase steels (dual phase, TRIP)
- Weldability
- Applications

Aluminium alloys:

Introduction to the fundamentals of aluminium materials

Alloy systems

Non age-hardenable Al alloys: Processing and microstructure, mechanical qualities and applications

Age-hardenable Al alloys: Processing and microstructure, mechanical qualities and applications

Magnesium alloys

Introduction to the fundamental of magnesium materials

Alloy systems

Magnesium casting alloys, processing, microstructure and qualities

Magnesium wrought alloys, processing, microstructure and qualities

Examples of applications

Titanium alloys

Introduction to the fundamental of the titanium materials

Alloy systems

Processing, microstructure and properties

Examples of applications

Exercises and excursions

Content	Students get the task in the form of a customer request for the development and production of a MTB handlebar made of fiber composites. In the task technical and normative requirements (standards) are given, all other required information come from the lectures and tutorials, and the respective documents (electronically and in conversation). The procedure is to specify in a milestone schedule and allows students to plan tasks and to work continuously. At project end, each group has a made handlebar with approved quality. In each project meeting the design (discussion of the requirements and risks) are discussed. The calculations are analyzed, evaluated and established manufacturing methods are selected. Materials are selected bar will be produced. The quality and the mechanical properties are checked. At the end of the final report created (compilation of the results for the "customers"). After the test during the "customer / supplier conversation" there is a mutual feedback-talk ("lessons learned") in order to ensure the continuous improvement.

Content	Recommended Previous Knowledge: Fundamentals of Materials Science and Engineering
	Basic Knowledge of Science and Technology of Welding and Joining
	Contents:
	The lecture and the related laboratory exercises intend to provide an insight on advanced joining technologies for polymer-metal lightweight structures used in engineering applications. A general understanding of the principles of the consolidated and new technologies and its main fields of applications is to be accomplished through theoretical and practical lectures:
	Theoretical Lectures:
	- Review of the relevant properties of Lightweight Alloys, Engineering Plastics and Composites in Joining Technology
	- Introduction to Welding of Lightweight Alloys, Thermoplastics and Fiber Reinforced Plastics
	- Mechanical Fastening of Polymer-Metal Hybrid Structures
	- Adhesive Bonding of Polymer-Metal Hybrid Structures
	- Fusion and Solid State Joining Processes of Polymer-Metal Hybrid Structures
	- Hybrid Joining Methods and Direct Assembly of Polymer-Metal Hybrid Structures
	Laboratory Exercises (will be offered at Helmholtz-Zentrum Geesthacht as a 2-3 days compact course)
	- Joining Processes: Introduction to state-of-the-art friction-based spot welding and joining technologies (Friction Riveting, Friction Spot Joining and Injection Clinching Joining)
	- Introduction to metallographic specimen preparation, optical microscopy and mechanical testing of polymer-metal joints
	Learning Outcomes:
	After successful completion of this unit, students should be able to understand the principles of welding and joining of polymer-metal lightweight structures as well as their application fields.

Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Swantje Bargmann, Dr. Ingo Scheider
Language	DE/EN
Cycle	WiSe
Content	
	fundamentals of finite element methods fundamentals of material modeling introduction to numerical implementation of material laws overview of modelling of different classes of materials combination of macroscopic quantities to material microstructure
Literature	D. Raabe: Computational Materials Science, The Simulation of Materials, Microstructures and Properties, Wiley-Vch J. Bonet, R.D. Wood, Nonlinear Continuum Mechanics for Finite Element Analysis, Cambridge G. Gottstein., Physical Foundations of Materials Science, Springer

Module M0604: High-Orde	r FEM			
Courses				
Title		Тур	Hrs/wk	CP
High-Order FEM (L0280)		Lecture	3 1	4
High-Order FEM (L0281)	D (4)	Recitation Section (large)		2
Module Responsible	Prof. Alexander Düster			
Admission Requirements	None			
Recommended Previous	Mathematics I, II, III, Mechanics I, II, III, IV			
Knowledge	D''' '' '' ' ' ' ' ' ' ' ' ' ' ' ' ' '			
	Differential Equations 2 (Partial Differential Equations)			
Educational Objectives	After taking part successfully, students have reached the following learn	ning results		
Professional Competence				
Knowledge	Students are able to			
	+ give an overview of the different (h, p, hp) finite element procedures.			
	+ explain high-order finite element procedures.			
	+ specify problems of finite element procedures, to identify them	in a given situation and to explai	n their mathemat	ical and mechanical
	background.			
Skills	Students are able to			
	+ apply high-order finite elements to problems of structural mechanics.			
	+ select for a given problem of structural mechanics a suitable finite ele	ment procedure.		
	critically judge results of high-order finite elements.			
	+ transfer their knowledge of high-order finite elements to new problem	S.		
Personal Competence				
Social Competence	Students are able to			
	+ solve problems in heterogeneous groups and to document the corres	ponding results.		
Autonomy	Students are able to			
	+ assess their knowledge by means of exercises and E-Learning.			
	+ acquaint themselves with the necessary knowledge to solve research	oriented tasks.		
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56			
Credit points	6			
Examination	Written exam			
Examination duration and scale	120 min			
Assignment for the Following	Energy Systems: Core qualification: Elective Compulsory			
Curricula	Computational Science and Engineering: Specialisation Scientific Com	puting: Elective Compulsory

Courses				
Title		Тур	Hrs/wk	СР
Modeling Across The Scales (L1537)		Lecture	2	3
Modeling Across The Scales - Excercise	e (L1538)	Recitation Section (small)	2	3
Module Responsible	Prof. Swantje Bargmann			
Admission Requirements	None			
Recommended Previous	mechanics I			
Knowledge	mechanics II			
Educational Objectives	After taking part successfully, students have reached th	e following learning results		
Professional Competence				
Knowledge	The students can describe different deformation mecha	nisms on different scales and can name the	appropriate kind of mo	deling concept suited for
	its description.			
Skills	The students are able to predict first estimates of the e	ffective material behavior based on the mate	erial's microstructure. Ti	ney are able to correlate
	and describe the damage behavior of materials based	on their micromechanical behavior. In parti	cular, they are able to a	apply their knowledge to
	different problems of material science and evaluate and	d implement material models into a finite ele	ment code.	
Personal Competence				
Social Competence	The students are able to present solutions to specialists	s and to develop ideas further.		
Autonomy	The students are able to assess their own strengths and	d weaknesses and to define tasks themselve	S.

Module M1237: Methods i	n Theoretical Materials Science				
Courses					
Title		Тур	Hrs/wk	СР	
Methods in Theoretical Materials Science	e (L1677)	Lecture	2	4	
Methods in Theoretical Materials Science	e (L1678)	Recitation Section (small)	1	2	
Module Responsible	Prof. Stefan Müller				
Admission Requirements	Obligatory lectures of the first semester of the master cou	rse of studies "materials science"			
Recommended Previous	Advanced mathematics, solid state physics				
Knowledge					
Educational Objectives	After taking part successfully, students have reached the	following learning results			
Professional Competence					
Knowledge	The master students will be able to explain				
	the basics of quantum mechanics.				
	the importance of quantum physics for the description of materials properties.				
	correlations between on quantum mechanics based phenomena between individual atoms and macroscopic properties of materials.				
	The master students will then be able to connect essential materials properties in engineering with materials properties on the atomistic scale in				
	order to understand these connections.				
Skills	After attending this lecture the students can				
	perform materials design on a quantum mechanical ba	asis.			
Personal Competence					
Social Competence	The student has an astonishing knowledge in materials	properties which demands both, expertise in	physics AND materia	als science. This makes	
	him to an outstanding discussion partner who will be ab	le to understand the scientific arguments of "b	oth sides". Up to no	w, such an education is	
	hard to find at universities.				
Autonomy	The students are able to				
	assess their own strengths and weaknesses.				
	define tasks independently

Content	
	 Introduction (historical view, scientific and economic relevance, scaling laws) Semiconductor Technology Basics, Lithography (wafer fabrication, photolithography, improving resolution, next-generation lithography, nano-imprinting, molecular imprinting) Deposition Techniques (thermal oxidation, epitaxy, electroplating, PVD techniques: evaporation and sputtering; CVD techniques: APCVD, LPCVD, PECVD and LECVD; screen printing) Etching and Bulk Micromachining (definitions, wet chemical etching, isotropic etch with HNA, electrochemical etching, anisotropic etching with KOH/TMAH: theory, corner undercutting, measures for compensation and etch-stop techniques; plasma processes, dry etching: back sputtering, plasma etching, RIE, Bosch process, cryo process, XeF2 etching) Surface Micromachining and alternative Techniques (sacrificial etching, film stress, stiction: theory and counter measures; Origami
	microstructures, Epi-Poly, porous silicon, SOI, SCREAM process, LIGA, SU8, rapid prototyping) • Thermal and Radiation Sensors (temperature measurement, self-generating sensors: Seebeck effect and thermopile; modulating sensors: thermo resistor, Pt-100, spreading resistance sensor, pn junction, NTC and PTC; thermal anemometer, mass flow sensor, photometry, radiometry, IR sensor: thermopile and bolometer) • Mechanical Sensors (strain based and stress based principle, capacitive readout, piezoresistivity, pressure sensor: piezoresistive, capacitive and fabrication process; accelerometer: piezoresistive, piezoelectric and capacitive; angular rate sensor: operating principle and fabrication process) • Magnetic Sensors (galvanomagnetic sensors: spinning current Hall sensor and magneto-transistor; magnetoresistive sensors: magnetoresistive se
	resistance, AMR and GMR, fluxgate magnetometer) Chemical and Bio Sensors (thermal gas sensors: pellistor and thermal conductivity sensor; metal oxide semiconductor gas sensor, organic semiconductor gas sensor, Lambda probe, MOSFET gas sensor, pH-FET, SAW sensor, principle of biosensor, Clark electrode, enzyme electrode, DNA chip) Micro Actuators, Microfluidics and TAS (drives: thermal, electrostatic, piezo electric and electromagnetic; light modulators, DMD, adaptive optics, microscanner, microvalves: passive and active, micropumps, valveless micropump, electrokinetic micropumps, micromixer, filter, inkjet printhead, microdispenser, microfluidic switching elements, microreactor, lab-on-a-chip, microanalytics)
	 MEMS in medical Engineering (wireless energy and data transmission, smart pill, implantable drug delivery system, stimulators microelectrodes, cochlear and retinal implant; implantable pressure sensors, intelligent osteosynthesis, implant for spinal cord regeneration) Design, Simulation, Test (development and design flows, bottom-up approach, top-down approach, testability, modelling: multiphysics, FEM and equivalent circuit simulation; reliability test, physics-of-failure, Arrhenius equation, bath-tub relationship) System Integration (monolithic and hybrid integration, assembly and packaging, dicing, electrical contact: wire bonding, TAB and flip chip bonding; packages, chip-on-board, wafer-level-package, 3D integration, wafer bonding: anodic bonding and silicon fusion bonding; micro electroplating, 3D-MID)

Artificial Joint Replacement (L1306)		Lecture	2	3	
Module Responsible	Prof. Michael Morlock				
Admission Requirements	None				
Recommended Previous	basic knowledge of orthopedic and surgical techniques	is recommended			
Knowledge					
Educational Objectives	After taking part successfully, students have reached th	e following learning results			
Professional Competence					
Knowledge	The students can describe the materials being used in medical engineering, and their fields of use.				
	The students can name the diseases which can require the use of replacement joints.				
	The students can name the different kinds of artificial limbs				
Skills	The students can explain the advantages and disadvantages of different kinds of biomaterials and endoprotheses.				
Personal Competence					
Social Competence	The student is able to discuss issues related to endoprothese and their materials with student mates and the teachers.				
Autonomy	The student is able to acquire information on his own. He can also judge the information with respect to its credebility.

-	Topics to be covered include:	
	Introduction (Importance, nomenclature, relations)	
	Biological materials	
	2.1 Basics (components, testing methods)	
	2.2 Bone (composition, development, properties, influencing factors)	
	2.3 Cartilage (composition, development, structure, properties, influencing factors)	
	2.4 Fluids (blood, synovial fluid)	
	3 Biological structures	
	3.1 Menisci of the knee joint	
	3.2 Intervertebral discs	
	3.3 Teeth	
	3.4 Ligaments	
	3.5 Tendons	
	6 Skin	
	7 Nervs	
	3.8 Muscles	
	4. Replacement materials	
	4.1 Basics (history, requirements, norms)	
	4.2 Steel (alloys, properties, reaction of the body)	
	4.3 Titan (alloys, properties, reaction of the body)	
	4.4 Ceramics and glas (properties, reaction of the body)	
	4.5 Plastics (properties of PMMA, HDPE, PET, reaction of the body)	
	4.6 Natural replacement materials	
	Knowledge of composition, structure, properties, function and changes/adaptations of biological and technical materials (which are used for replacements in-vivo). Acquisition of basics for theses work in the area of biomechanics.

Content	Biological materials are omnipresent in the world around us. They are the main constituents in plant and animal bodies and have a diversity of functions. A fundamental function is obviously mechanical providing protection and support for the body. But biological materials may also serve as ion reservoirs (bone is a typical example), as chemical barriers (like cell membranes), have catalytic function (such as enzymes), transfer chemical into kinetic energy (such as the muscle), etc. This lecture will focus on materials with a primarily (passive) mechanical function: cellulose tissues (such as wood), collagen tissues (such as tendon or cornea), mineralized tissues (such as bone, dentin and glass sponges). The main goal is to give an introduction to the current knowledge of the structure in these materials and how these structures relate to their (mostly mechanical) functions.

Autonomy Students are able: • To structure a project of their own in work packages and to work them off accordingly. • To work their way in depth into a largety unknown subject and to access the information required for them to do so. • To apply the techniques of scientific work comprehensively in research of their own. Workload in Hours Independent Study Time 900, Study Time in Lecture 0 Credit points Examination Examination and scale aser SPPO Assignment for the Following Curricuta Bioprocess Engineering: Thesis: Compulsory Clivil Engineering: Thesis: Compulsory Chemical and Stoprocess Engineering: Thesis: Compulsory Chemical and Stoprocess Engineering: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Energy and Environmental Engineering: Thesis: Compulsory Energy and Environmental Engineering: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory Informational Production Management: Thesis: Compulsory International Production Management: Thesis: Compulsory Mermational Production Management: Thesis: Compulsory Mermational Engineering: Thesis: Compulsory Methanical Engineering: Thesis: Compulsory Methanical Engineering: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory Microelectonics and Microeystems: Thesis: Compulsor		Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way.
Autonomy Students are able: • To structure a project of their own in work packages and to work them off accordingly. • To work their way in depth into a largely unknown subject and to access the information required for them to do so. • To apply the techniques of scientific work comprehensively in research of their own. Workload in Hours Independent Study Time 900, Study Time in Lecture 0 Examination according to Subject Specific Regulations Examination duration and scale Assignment for the Following Curricula Gioprocess Engineering: Thesis: Compulsory Computer Science: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Energy and Environmental Engineering: Thesis: Compulsory Environmental Engineering: Thesis: Compulsory Environmental Engineering: Thesis: Compulsory Aircraft Systems Engineering: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory Information and Production Management: Thesis: Compulsory Information and Production Management and Engineering: Thesis: Compulsory Information and Ranagement and Engineering: Thesis: Compulsory Information and Ranagement and Engineering: Thesis: Compulsory Materials Science: Thesis: Compulsory Materials Science: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory Microelectonics and Microeystems: Thesis: Compulsory		Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholding
To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. To apply the techniques of scientific work comprehensively in research of their own. Workload in Hours Credit points Examination Examination duration and scale See FSPO Curricula Curricula Curricula Computer Science: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Energy and Environmental Engineering: Thesis: Compulsory Energy systems: Thesis: Compulsory Energy systems: Thesis: Compulsory Environmental Engineering: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Production Management: Thesis: Compulsory Materials Science: Thesis: Compulsory Materials Science: Thesis: Compulsory Mechanical Engineering and Management: Thesis: Compulsory Mechanical Engineering: The		their own assessments and viewpoints convincingly.
To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. To apply the techniques of scientific work comprehensively in research of their own. Workload in Hours Credit points Examination Examination duration and scale See FSPO Curricula Curricula Curricula Computer Science: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Energy and Environmental Engineering: Thesis: Compulsory Energy systems: Thesis: Compulsory Energy systems: Thesis: Compulsory Environmental Engineering: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Global Innovation Management: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory Information and Communication Systems: Thesis: Compulsory International Production Management: Thesis: Compulsory Materials Science: Thesis: Compulsory Materials Science: Thesis: Compulsory Mechanical Engineering and Management: Thesis: Compulsory Mechanical Engineering: The		
To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. To apply the techniques of scientific work comprehensively in research of their own.
