Thesis	71
Module M-002: Master Thesis	71

Program description

Content

Core qualification

Module M0522. Business	9 Management
Module M0523: Business	a management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	None
Recommended Previous	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge Skills	 Students are able to find their way around selected special areas of management within the scope of business management. Students are able to explain basic theories, categories, and models in selected special areas of business management. Students are able to interrelate technical and management knowledge.
Personal Competence Social Competence Autonomy	
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module M0524: Nontechnical Elective Complementary Courses for Master		
Module Responsible	Dagmar Richter	
Admission Requirements	quirements None	
Recommended Previous	None	
Knowledge	Knowledge	
Educational Objectives	Educational Objectives After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledae	The Nontechnical Academic Programms (NTA)	

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, selfmanagement, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- explain specialized areas in context of the relevant non-technical disciplines.
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic and specific methods of the said scientific disciplines,
- aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner.
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to

Personal Competence

Social Competence	Personal Competences (Social Skills)
	Students will be able
	 to learn to collaborate in different manner, to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomu	Devenuel Competences (Colf religions)
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
	to digatile the medical characteristic and an object central factor and an
Workload in Hours	Depends on choice of courses
Credit points	6

Courses

Module M1197: Multiphas	e Materials			
Courses				
Title		Тур	Hrs/wk	СР
Applied Computational Methods for Mate	erial Science (L1626)	Problem-based Learning	3	3
Polymer Composites (L1891)		Lecture	2	3
Module Responsible	Prof. Bodo Fiedler			
Admission Requirements	None			
Recommended Previous				
Knowledge	Polymers			
	Physics			
	Mechanic / Micromechanics			
Educational Objectives	After taking part successfully, students have reached the following lear	ning results		
Professional Competence				
Knowledge	Students can			
	- explain the complex relationships of the mechanics of composite mat	erials, the failure mechanisms a	nd physical properties	S .
	- assess the interactions of microstructure and properties of the matrix	and reinforcing materials.		
	- explain e.g. different fiber types, including relative contexts (e.g. susta	tinability, environmental protecti	on).	
	They know different methods of modeling multiphase materials an	d can apply them.		
Skills	Students are capable of			
	 using standardized methods of calculation and modeling using the Programming with Python, Automated control and evaluation of para bending, four point bend, crack propagation, J-Integral, Cohesive zone 	meter studies and examples to		
	- determining the material properties (elasticity, plasticity, small and lar	ge deformations, modeling of m	ultiphase materials).	
	- to calculate and evaluate the mechanical properties (modulus, streng	gth) of different materials.		
	- Approximate sizing using the network theory of the structural element	s implement and evaluate.		
	- selecting appropriate solutions for mechanical material probmethods).	olems: Solution of inverse p	oroblems (neural ne	etworks, optimization
Personal Competence				
Social Competence	Students can,			
	- arrive at work results in groups and document them.			
	- provide appropriate feedback and handle feedback on their own p	performance constructively.		
Autonomy	Students are able to,			
	- assess their own strengths and weaknesses			
	- assess their own state of learning in specific terms and to define furth	er work steps on this basis guid	ed by teachers.	
	They are able to fill gaps in as well as extent their knowledge. Furthermore, they can meaningfully extend given problems and concepts.	=	•	
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70			
Credit points	6			
Examination	Written exam			
Examination duration and scale	1,5 h written exam in Polymermatrix Composites			
Assignment for the Following	Materials Science: Core qualification: Compulsory			
Curricula				

Course L1626: Applied Computational Methods for Material Science		
Тур	Problem-based Learning	
Hrs/wk	3	
CP	3	
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42	
Lecturer	Prof. Norbert Huber	
Language	DE/EN	
Cycle	WiSe	
Content	Finite Element Method (discretisation, solver, programming with Python, automatized control and analysis of parametric studies)	
	Examples of elastomechanics (tension, bending, four-point-bending, crack propagation, J-integral, cohesive zone models, contact)	
	Material behaviour (elasticity, plasticity, small and finite deformations, modelling of multiphase materials)	
	Solution of inverse problems (artificial neural networks, optimization)	
Literature	Alle Vorlesungsmaterialien und Beispiellösungen (Input-Dateien, Python Scirpte) werden auf Stud.IP zur Verfügung gestellt.	
	All lecture material and example solutions (input files, python scripts) will be made available in Stud.IP.

Courses				
Title		Тур	Hrs/wk	СР
Multiscale Materials (L1659)		Lecture	6	6
Module Responsible	Prof. Gerold Schneider			
Admission Requirements	None			
Recommended Previous	Fundamentals in physics and chemistry, Fundamentals and en	hanced fundamentals in materials	s science, Advanced mathe	matics, Fundamentals
Knowledge	of the theory elasticity			
Educational Objectives	After taking part successfully, students have reached the follow	ing learning results		
Professional Competence				
Knowledge	The master students will be able to explain			
	the fundamental chemical and physical properties of metals,	ceramics and polymers.		
	the correlation of chemical and physical phenomena on the	atomic, meso and macroscale and	d its consequences for the n	nacroscopic properties
	of materails.			
	The master students will then be able understand the depende	nce of the macroscopic material p	roperties on the underlying	hierarchical levels.
Skills	After attending this lecture the students can			
	perform materials design for multiscale materials.			
Personal Competence				
Social Competence	The student has an astonishing knowledge in materials properties which demands both, expertise in chemistry, physics and materials science		and materials science.	
	This makes him to an outstanding discussion partner who will	be able to understand the scient	ific arguments of "both side:	s". Up to now, such an
	education is hard to find at universities.			
Autonomy	The students are able to			
	assess their own strengths and weaknesses.			
	define tasks independently.

Language	DE
Cycle	WiSe
Content	The materials discussed in this lecture differ from "conventional" ones due to their individual hierarchic microstructure. In conventional microstructure design, the morphology is adjusted, for instance, by thermal treatment and concurrent mechanical deformation. The material is continually and steadily optimized by small changes in structure or chemical composition, also in combination with self-organization processes (precipitation alloys, ceramic glasses, eutectic structures).
	The presented materials consist of functionalized elementary functional units based on polymers, ceramics, metals and carbon nanotubes (CNTs), which are used to create macroscopic hierarchical material systems, whose characteristic lengths range from the nanometer to the centimeter scale. These elementary functional units are either core-shell structures or cavities in metals created by alloy corrosion and subsequent polymer filling.
	Three classes of material systems will be presented:
	First, hierarchically structured ceramic/metal-polymer material systems similar to naturally occurring examples, namely nacre (1 hierarchical level), enamel (3 hierarchical levels) and bone (5 hierarchical levels) will be discussed. Starting with an elementary functional unit consisting of ceramic nanoparticles with a polymeric coating, a material is created in which on each hierarchical level, "hard" particles, made of the respective lower hierarchical level, are present in a soft polymer background. The resulting core-shell structure on each hierarchical level is the fundamental difference compared to a compound material made of rigid interpenetrating ceramic or metallic networks.
	The second material system is based on nanoporous gold, which acts as a prototypical material for new components in light weight construction with simultaneous actuator properties. Their production and resulting length-scale specific mechanical properties will be explained. Furthermore, related scale-spanning theoretical models for their mechanical behavior will be introduced. This covers the entire scale from the electronic structure on the atomic level up to centimeter-sized macroscopic samples.
	The third material system discussed in the lecture are novel hierarchical nanostructured materials based on thermally stable ceramics and metals for high-temperature photonics with potential use in thermophotovoltaic systems (TPVs) and thermal barrier coatings (TBCs). Direct and inverted 3D-photonic crystal structures (PhCs) as well as novel optically hyperbolic media, in particular, are worthwhile noting. Due to their periodicity and diffraction index contrast, PhCs exhibit a photonic band structure, characterized by photonic band gaps, areas of particularly high photonic densities of states and special dispersion relations. The presented properties are to be used to reflect thermal radiation in TBCs in a strong and directed manner, as well as to link radiation effectively and efficiently in TPVs.

Course L1662: Dislocation Theory	of Plasticity
Тур	Lecture
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Erica Lilleodden
Language	DE/EN
Cycle	SoSe
Content	This class will cover the principles of dislocation theory from a physical metallurgy perspective, providing a fundamental understanding of the relations between the strength and of crystalline solids and distributions of defects.
	We will review the concept of dislocations, defining terminology used, and providing an overview of important concepts (e.g. linear elasticity, stress-strain relations, and stress transformations) for theory development. We will develop the theory of dislocation plasticity through derived stress-strain fields, associated self-energies, and the induced forces on dislocations due to internal and externally applied stresses. Dislocation structure will be discussed, including core models, stacking faults, and dislocation arrays (including grain boundary descriptions). Mechanisms of dislocation multiplication and strengthening will be covered along with general principles of creep and strain rate sensitivity. Final topics will include non-FCC dislocations, emphasizing the differences in structure and corresponding implications on dislocation mobility and macroscopic mechanical behavior; and dislocations in finite volumes.
Literature	Vorlesungsskript Aktuelle Publikationen Bücher: Introduction to Dislocations, by D. Hull and D.J. Bacon Theory of Dislocations, by J.P. Hirth and J. Lothe Physical Metallurgy, by Peter Hassen

Module M1221: Project w	ork on Modern Issues in the Materials Sciences
Courses	
Title	Typ Hrs/wk CP
Module Responsible	Prof. Jörg Weißmüller
Admission Requirements	None
Recommended Previous	knowledge of Materials Science fundamentals
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	detailed knowledge in the area of the project topic
Skills	 independent familiarization with the scientific context of a specified topic guided execution of scientific experiment, computation or simulation data analysis and scientific discussion of results written presentation of results in a protocol oral presentation of the project results
Personal Competence	
Social Competence	Students are able to discuss scientific results with specific target groups, to document results in a written form and to present them orally.
Autonomy	,
Workload in Hours	Independent Study Time 360, Study Time in Lecture 0
Credit points	12
Examination	Project (accord. to Subject Specific Regulations)
Examination duration and scale	
Assignment for the Following Curricula	

Specialization Engineering Materials

Students learn in the Engineering Materials specialization the evaluation of the different materials in the technology-oriented environment.

They gain knowledge about process planning as well as managing of projects or personnel. Students are able to evaluate and make decisions on materials, industrial production, quality assurance and failure analysis.

Educational Objectives	After taking part successfully, students have reach	ed the following learning results		
Professional Competence				
Knowledge	Students are able to give a summary of the tech	nical details of the manufacturing processes com	posites and illustrate r	espective relationships.
	They are capable of describing and communicating relevant problems and questions using appropriate technical language. They can explain the			
	typical process of solving practical problems and p	present related results.		
Skills	The students can transfer their fundamental known	owledge on civil engineering to the process of	solving practical probl	ems. They identify and
	The students can transfer their fundamental knowledge on civil engineering to the process of solving practical problems. They identify and overcome typical problems during the realization of projects in the context of civil engineering. Students are able to develop, compare, and choose			
	conceptual solutions for non-standardized problems.			
Personal Competence				
Social Competence	Students are able to cooperate in small, mixed-subject groups in order to independently derive solutions to given problems in the context of civil			
	engineering. They are able to effectively present and explain their results alone or in groups in front of a qualified audience. Students have the			
	ability to develop alternative approaches to an eng	gineering problem independently or in groups and	discuss advantages a	s well as drawbacks.
Autonomy	Students are capable of independently solving mechanical engineering problems using provided literature. They are able to fill gaps in as well as			
	extent their knowledge using the literature and	other sources provided by the supervisor. Furth	nermore, they can me	aningfully extend given
	problems and pragmatically solve them by means	of corresponding solutions and concepts.

Content	Students get the task in the form of a customer request for the development and production of a MTB handlebar made of fiber composites. In the task technical and normative requirements (standards) are given, all other required information come from the lectures and tutorials, and the respective documents (electronically and in conversation). The procedure is to specify in a milestone schedule and allows students to plan tasks and to work continuously. At project end, each group has a made handlebar with approved quality. In each project meeting the design (discussion of the requirements and risks) are discussed. The calculations are analyzed, evaluated and established manufacturing methods are selected. Materials are selected bar will be produced. The quality and the mechanical properties are checked. At the end of the final report created (compilation of the results for the "customers"). After the test during the "customer / supplier conversation" there is a mutual feedback-talk ("lessons learned") in order to ensure the continuous improvement.
Literature	Customer Request ("Handout")

Examination of Materials, Structural Cor	dition and Damages (L0260)	Lecture	4	4
Examination of Materials, Structural Con	dition and Damages (L0261)	Recitation Section (small) 1	2
Module Responsible	Prof. Frank Schmidt-Döhl			
Admission Requirements	None			
Recommended Previous	Basic knowledge about building materials or material s	cience, for example by the module Build	ing Materials and Building	Chemistry.
Knowledge				
Educational Objectives	After taking part successfully, students have reached the	e following learning results		
Professional Competence				
Knowledge	The students are able to describe the rules for trading, use and marking of construction products in Germany. They know which methods for the testing of building material properties are usable and know the limitations and characterics of the most important testing methods.			
Skills	The students are able to responsibly discover the rules for trading and using of building products in Germany. They are able to chose suitable methods for the testing and inspection of construction products, the examination of damages and the examination of the structural conditions of buildings. They are able to conclude from symptons to the cause of damages. They are able to describe an examination in form of a test report or expert opinion.

Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students can explain the most important facts and relationships of a specific topic from the field of materials science.			
	Students are able to compile a specified topic from the field of materials science and to give a clear, structured and comprehensible presentation of the subject. They can comply with a given duration of the presentation. They can write in English a summary including illustrations that contains the most important results, relationships and explanations of the subject.			
Personal Competence				
·	Students are able to adapt their presentation with respect to content, detailedness, and presentation style to the composition and previous knowledge of the audience. They can answer questions from the audience in a curt and precise manner.			
*	Students are able to autonomously carry out a literature research concerning a given topic. They can independently evaluate the material. They can self-reliantly decide which parts of the material should be included in the presentation.

Content	Recommended Previous Knowledge: Fundamentals of Materials Science and Engineering
	Basic Knowledge of Science and Technology of Welding and Joining
	Contents:
	The lecture and the related laboratory exercises intend to provide an insight on advanced joining technologies for polymer-metal lightweight structures used in engineering applications. A general understanding of the principles of the consolidated and new technologies and its main fields of applications is to be accomplished through theoretical and practical lectures:
	Theoretical Lectures:
	- Review of the relevant properties of Lightweight Alloys, Engineering Plastics and Composites in Joining Technology
	- Introduction to Welding of Lightweight Alloys, Thermoplastics and Fiber Reinforced Plastics
	- Mechanical Fastening of Polymer-Metal Hybrid Structures
	- Adhesive Bonding of Polymer-Metal Hybrid Structures
	- Fusion and Solid State Joining Processes of Polymer-Metal Hybrid Structures
	- Hybrid Joining Methods and Direct Assembly of Polymer-Metal Hybrid Structures
	Laboratory Exercises (will be offered at Helmholtz-Zentrum Geesthacht as a 2-3 days compact course)
	- Joining Processes: Introduction to state-of-the-art friction-based spot welding and joining technologies (Friction Riveting, Friction Spot Joining and Injection Clinching Joining)
	- Introduction to metallographic specimen preparation, optical microscopy and mechanical testing of polymer-metal joints
	Learning Outcomes:
	After successful completion of this unit, students should be able to understand the principles of welding and joining of polymer-metal lightweight structures as well as their application fields.

Content Lightweight construction

- Structural lightweight construction
- Material lightweight construction
- Choice criteria for metallic lightweight construction materials

Steel as lightweight construction materials

- Introduction to the fundamentals of steels
- Modern steels for the lightweight construction
- Fine grain steels
- High-strength low-alloyed steels
- Multi-phase steels (dual phase, TRIP)
- Weldability
- Applications

Aluminium alloys:

Introduction to the fundamentals of aluminium materials

Alloy systems

Non age-hardenable Al alloys: Processing and microstructure, mechanical qualities and applications

Age-hardenable Al alloys: Processing and microstructure, mechanical qualities and applications

Magnesium alloys

Introduction to the fundamental of magnesium materials

Alloy systems

Magnesium casting alloys, processing, microstructure and qualities

Magnesium wrought alloys, processing, microstructure and qualities

Examples of applications

Titanium alloys

Introduction to the fundamental of the titanium materials

Alloy systems

Processing, microstructure and properties

Examples of applications

Exercises and excursions

Course L1537: Modeling Across T	he Scales
Тур	Lecture
Hrs/wk	2
CP	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Swantje Bargmann
Language	DE/EN
Cycle	SoSe
Content	 modeling of deformation mechanisms in materials at different scales (e.g., molecular dynamics, crystal plasticity, phenomenological models,) relationship between microstructure and macroscopic mechanical material behavior Eshelby problem effective material properties, concept of RVE homogenisation methods, coupling of scales (micro-meso-macro) micromechanical concepts for the description of damage and failure behavior
Literature	 D. Gross, T. Seelig, Bruchmechanik: Mit einer Einführung in die Mikromechanik, Springer T. Zohdi, P. Wriggers: An Introduction to Computational Micromechanics D. Raabe: Computational Materials Science, The Simulation of Materials, Microstructures and Properties, Wiley-Vch G. Gottstein., Physical Foundations of Materials Science, Springer

Course L1538: Modeling Across T	he Scales - Excercise
Тур	Recitation Section (small)

Module M1237: Methods in				
	Theoretical Materials Science			
Courses				
Title		Тур	Hrs/wk	СР
Methods in Theoretical Materials Science ((L1677)	Lecture	2	4
Methods in Theoretical Materials Science	(L1678)	Recitation Section (small)	1	2
Module Responsible F	Prof. Stefan Müller			
Admission Requirements	None			
Recommended Previous	Advanced mathematics, solid state physics			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following lea	arning results		
Professional Competence				
Knowledge T	The master students will be able to explain			
	the basics of quantum mechanics.			
	the importance of quantum physics for the description of materials properties.			
	correlations between on quantum mechanics based phenomena between individual atoms and macroscopic properties of materials.			
т	The master students will then be able to connect essential materials properties in engineering with materials properties on the atomistic scale in			
	order to understand these connections.			
Skills A	After attending this lecture the students can			
	perform materials design on a quantum mechanical basis.			
Personal Competence				
·	The student has an astonishing knowledge in materials properties w	hich demands both, expertise in ph	ysics AND materia	als science. This makes
	nim to an outstanding discussion partner who will be able to underst			
h	nard to find at universities.			
Autonomy T	The students are able to			
	assess their own strengths and weaknesses.			
	define tasks independently			
Workload in Hours	Independent Study Time 138, Study Time in Lecture 42			
Credit points 6				
	Oral exam

Courses					
Title		Тур	Hrs/wk	CP	
Nonlinear Structural Analysis (L0277)		Lecture	3	4	
Nonlinear Structural Analysis (L0279)		Recitation Section (small)	1	2	
Module Responsible	Prof. Alexander Düster				
Admission Requirements					
Recommended Previous					
Knowledge					
	Differential Equations 2 (Partial Differential Equations)				
Educational Objectives	After taking part successfully, students have reached the followin	g learning results			
Professional Competence					
Knowledge	Students are able to				
	+ give an overview of the different nonlinear phenomena in struc	tural mechanics.			
	+ explain the mechanical background of nonlinear phenomena in	n structural mechanics.			
	+ to specify problems of nonlinear structural analysis, to ident	ify them in a given situation and to	explain their mather	matical and mechanica	
	background.				
Skille	Students are able to				
OKIIIS	+ model nonlinear structural problems.				
	+ select for a given nonlinear structural problem a suitable comp	utational procedure			
	+ apply finite element procedures for nonlinear structural analysi				
	+ critically verify and judge results of nonlinear finite elements.	.			
	+ to transfer their knowledge of nonlinear solution procedures to new problems.				
Personal Competence					
Social Competence					
	+ solve problems in heterogeneous groups and to document the corresponding results.				
	+ share new knowledge with group members.				
Autonomy					
	+ assess their knowledge by means of exercises and E-Learning	J.			
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56

Admission Requirements	None			
Recommended Previous	Fundamental knowledge on nanomaterials, ele	ectrochemistry, interface science, mechanics		
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students can explain the most important facts and relationships of a specific topic from the field of materials science.			
Skills	Students are able to compile a specified topic from the field of materials science and to give a clear, structured and comprehensible presentation			
	of the subject. They can comply with a given duration of the presentation. They can write in English a summary including illustrations that contains			
	the most important results, relationships and explanations of the subject.			
Personal Competence				
Social Competence	Students are able to adapt their presentation with respect to content, detailedness, and presentation style to the composition and previous			
	knowledge of the audience. They can answer of	questions from the audience in a curt and precise m	nanner.	
Autonomy	Students are able to autonomously carry out a	a literature research concerning a given topic. The	y can indopondently eye	duate the material. They
Autonomy	can self-reliantly decide which parts of the mate		y can independently eva	iluate the material. They
	can sen-renantly decide which parts of the mate	enai snould be included in the presentation.

Module M0643: Optoelecti	ronics I - Wave Optics					
Courses						
Title		Тур	Hrs/wk	СР		
Optoelectronics I: Wave Optics (L0359)		Lecture	2	3		
Optoelectronics I: Wave Optics (Problem Solving Course) (L0361) Recitation Section (small)						
Module Responsible	Prof. Manfred Eich					
Admission Requirements	None					
Recommended Previous	Basics in electrodynamics, calculus					
Knowledge						
Educational Objectives	After taking part successfully, students have reached the follow	ng learning results				
Professional Competence	The land grant succession, stadents have reasted the lonew	ng rearning resents				
Knowledge	Students can explain the fundamental mathematical and physic	al relations of freely propagating optic	cal waves.			
rinemeage	Students can explain the fundamental mathematical and physical relations of freely propagating optical waves. They can give an overview on wave optical phenomena such as diffraction, reflection and refraction, etc.					
	Students can describe waveoptics based components such as electrooptical modulators in an application oriented way.					
	Casterno Car. Coccined national dated components soon as created prical modulators in an application ellerited way.					
Skills	Students can generate models and derive mathematical descriptions in relation to free optical wave propagation.					
S.i.i.i	They can derive approximative solutions and judge factors influential on the components' performance.					
	, , , ,	·				
Personal Competence						
Social Competence	Students can jointly solve subject related problems in groups. They can present their results effectively within the framework of the problem solving					
	course.					
Autonomy	Students are capable to extract relevant information from the provided references and to relate this information to the content of the lecture. They					
	can reflect their acquired level of expertise with the help of lecture accompanying measures such as exam typical exam questions. Students are					
	able to connect their knowledge with that acquired from other lectures.					
Workload in Hours	Independent Study Time 78, Study Time in Lecture 42					
Credit points	4					
Examination	Written exam					
Examination duration and scale	40 minutes

Courses				
Title		Тур	Hrs/wk	СР
Semiconductor Seminar (L0760)		Seminar	2	2
Module Responsible	Dr. Dietmar Schröder			
Admission Requirements	None			
Recommended Previous	Bachelor of Science			
Knowledge	Semiconductors			
Educational Objectives	After taking part successfully, students have r	eached the following learning results		
Professional Competence				
Knowledge	Students can explain the most important facts	and relationships of a specific topic from the field of	f semiconductors.	
Skills	Students are able to compile a specified topic from the field of semiconductors and to give a clear, structured and comprehensible presentation of			
	the subject. They can comply with a given duration of the presentation. They can write in English a summary including illustrations that contain			
	the most important results, relationships and	explanations of the subject.		
Personal Competence				
Social Competence	Students are able to adapt their presentati	on with respect to content, detailedness, and pre-	sentation style to the co	mposition and previous
	knowledge of the audience. They can answe	r questions from the audience in a curt and precise r	manner.	
Autonomy	Students are able to autonomously carry out	a literature research concerning a given topic. The	ey can independently eva	luate the material. They
	can self-reliantly decide which parts of the ma	aterial should be included in the presentation.		
Workload in Hours	Independent Study Time 32, Study Time in Le	ecture 28		
Credit points	2			
Examination	Presentation			
Examination duration and scale	15 minutesw presentation + 5-10 minutes dis	cussion + 2 pages written abstract

Module M1220: Interfaces	and interface-dominated Materials			
Courses				
Title		Тур	Hrs/wk	СР
Nature's Hierarchical Materials (L1663)		Seminar	2	3
Interfaces (L1654)		Lecture	2	3
Module Responsible	Prof. Patrick Huber			
Admission Requirements	None			
Recommended Previous	Fundamentals of Materials Science (I and II) and physical	chemistry		
Knowledge				
Educational Objectives	After taking part successfully, students have reached the for	ollowing learning results		
Professional Competence				
Knowledge	The students will be able to explain the properties of adva	nced materials along with their applica	ations in technology, in par	ticular metallic, ceramic,
	polymeric, semiconductor, modern composite materials (b	iomaterials) and nanomaterials.		
01.11				
Skills	The students will be able to select material configurations	•		-
	architectural principles from the micro- to the macroscale them to select optimum materials combinations depending	•	view on modern materials	science, which enables
	them to select optimum materials combinations depending	g on the technical applications.		
Personal Competence				
Social Competence	The students are able to present solutions to specialists at	nd to develop ideas further.		
Autonomy	The students are able to			
	 assess their own strengths and weaknesses. 			
	 define tasks independently.

Content	Biological materials are omnipresent in the world around us. They are the main constituents in plant and animal bodies and have a diversity of functions. A fundamental function is obviously mechanical providing protection and support for the body. But biological materials may also serve as ion reservoirs (bone is a typical example), as chemical barriers (like cell membranes), have catalytic function (such as enzymes), transfer chemical into kinetic energy (such as the muscle), etc. This lecture will focus on materials with a primarily (passive) mechanical function: cellulose tissues (such as wood), collagen tissues (such as tendon or cornea), mineralized tissues (such as bone, dentin and glass sponges). The main goal is to give an introduction to the current knowledge of the structure in these materials and how these structures relate to their (mostly mechanical) functions.

Educational Objectives	After taking part successfully, students have reached the following lear	rning results		
Professional Competence				
Knowledge	The master students will be able to explain			
	the basics of quantum mechanics.			
	\ldots the importance of quantum physics for the description of materials \boldsymbol{p}	properties.		
	correlations between on quantum mechanics based phenomena be	etween individual atoms and mac	roscopic properties	of materials.
	The master students will then be able to connect essential materials	properties in engineering with ma	aterials properties o	n the atomistic scale in
	order to understand these connections.			
Skills	After attending this lecture the students can			
	perform materials design on a quantum mechanical basis.			
Personal Competence				
Social Competence	The student can connect the atomistic picture as teached in the lect	ure with her/his macroscopic obs	ervation. Therefore	, she/he will be able to
	develop an interpretation of the observed behavior based on the nano	oscale.		
Autonomy	The students are able to			
	assess their own strengths and weaknesses.			
	define tasks independently.			
Workload in Hours	Independent Study Time 138, Study Time in Lecture 42

Module M1239: Experimen	ntal Micro- and Nanomechanics			
Courses				
Title		Тур	Hrs/wk	СР
Experimental Micro- and Nanomechanic	s (L1673)	Lecture	2	4
Experimental Micro- and Nanomechanic	s (L1674)	Recitation Section (small)	1	2
Module Responsible	Dr. Erica Lilleodden			
Admission Requirements	None			
Recommended Previous	Basics in Materials Science I/II, Mechanical Properties, Ph	enomena and Methods in Materials Scie	nce	
Knowledge				
Educational Objectives	After taking part successfully, students have reached the f	ollowing learning results		
Professional Competence				
Knowledge	Students are able to describe the principles of mechanica	I behavior (e.g., stress, strain, modulus, s	trength, hardening, failur	e, fracture).
	Students can explain the principles of characterization in diffraction)	nethods used for investigating microstru	cture (e.g., scanning elec	ctron microscopy, x-ra
	They can describe the fundamental relations between mid	crostructure and mechanical properties.		
Skills	Students are capable of using standardized calculation materials under varying loading states (e.g., uniaxial stres		anical properties (modulu	us, strength) of differen
Personal Competence				
Social Competence	Students can provide appropriate feedback and handle fe	edback on their own performance constr	uctively.	
Autonomy	Students are able to			
	- assess their own strengths and weaknesses			
	- assess their own state of learning in specific terms and to	define further work steps on this basis g	uided by teachers.	
	- to be able to work independently based on lectures and	notes to solve problems, and to ask for h	elp or clarifications when	needed

Content	This class will cover the principles of mechanical testing at the micron and nanometer scales. A focus will be made on metallic materials, though
	issues related to ceramics and polymeric materials will also be discussed. Modern methods will be explored, along with the scientific questions
	investigated by such methods.
	Principles of micromechanics
	Motivations for small-scale testing
	Sample preparation methods for small-scale testing
	General experimental artifacts and quantification of measurement resolution
	Complementary structural analysis methods
	Electron back scattered diffraction
	Transmission electron microscopy
	Micro-Laue diffraction
	Nanoindentation-based testing
	Principles of contact mechanics
	Berkovich indentation
	■ Loading geometry
	■ Governing equations for analysis of stress & strain
	■ Case study:
	Indentation size effects
	Microcompression
	■ Loading geometry
	Governing equations for analysis of stress & strain
	■ Case study:
	Size effects in yield strength and hardening
	Microbeam-bending
	Loading geometry Coversing equations for analysis of strong & strain
	Governing equations for analysis of stress & strainCase study:
	Fracture strength & toughness

Admission Requirements	None			
Recommended Previous	Basic knowledge of solids processes and particle	technology		
Knowledge				
Educational Objectives	After taking part successfully, students have reach	ned the following learning results		
Professional Competence				
Knowledge	After completion of the module the students	will be able to describe and explain processes	for solids processi	ng in detail based
	microprocesses on the particle level.			
Skills	Students are able to choose process steps and	apparatuses for the focused treatment of solids de	pending on the spec	ific characteristics. Th
	furthermore are able to adapt these processes and to simulate them.			
Personal Competence				
Social Competence	Students are able to present results from small teamwork projects in an oral presentation and to discuss their knowledge with scientific			
	researchers.			
Autonomy	Students are able to analyze and solve problems regarding solid particles independently or in small groups.

Admission Requirements	None			
Recommended Previous	Fundamental knowledge on nanomaterials, electrochemi	stry, interface science, mechanics		
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
Professional Competence				
Knowledge	Students can explain the most important facts and relation	nships of a specific topic from the field	of materials science.	
	Students are able to compile a specified topic from the field of materials science and to give a clear, structured and comprehensible presentation of the subject. They can comply with a given duration of the presentation. They can write in English a summary including illustrations that contains the most important results, relationships and explanations of the subject.			
Personal Competence				
·	Students are able to adapt their presentation with respect to content, detailedness, and presentation style to the composition and previous knowledge of the audience. They can answer questions from the audience in a curt and precise manner.			
*	Students are able to autonomously carry out a literature research concerning a given topic. They can independently evaluate the material. They can self-reliantly decide which parts of the material should be included in the presentation.

Module M-002: Master The	esis		
Courses			
Title	Тур	Hrs/wk	СР
Module Responsible	Professoren der TUHH		
Admission Requirements	According to Occasion Devolutions (OA/A):		
	According to General Regulations §24 (1):		
	At least 78 credit points have to be achieved in study programme. The examinations board decides of	n exceptions.	
Recommended Previous			
Knowledge			
Educational Objectives	After taking part successfully, students have reached the following learning results		
Professional Competence			
Knowledge		atly on onooioliz	ad issues
	 The students can use specialized knowledge (facts, theories, and methods) of their subject compete The students can explain in depth the relevant approaches and terminologies in one or more are 		
	developments and taking up a critical position on them.	ad or their subj	cot, accombing carrer
	The students can place a research task in their subject area in its context and describe and critically	assess the state	of research.
Skills	The students are able:		
	To select, apply and, if necessary, develop further methods that are suitable for solving the specialize.	ed problem in qu	iestion.
	To apply knowledge they have acquired and methods they have learnt in the course of their st		
	defined problems in a solution-oriented way.		
	To develop new scientific findings in their subject area and subject them to a critical assessment.		
Personal Competence			
Social Competence			
	Suborito dall'		
	Both in writing and orally outline a scientific issue for an expert audience accurately, understandably		
	Deal with issues competently in an expert discussion and answer them in a manner that is appropr	ate to the addre	ssees while upholding
	their own assessments and viewpoints convincingly.		
Autonomy	Students are able:		
Autonomy			
	To structure a project of their own in work packages and to work them off accordingly.		
	To work their way in depth into a largely unknown subject and to access the information required for	them to do so.	
	To apply the techniques of scientific work comprehensively in research of their own.		
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
