### Module Responsible
Prof. Thorsten Kern

### Admission Requirements
None

### Recommended Previous Knowledge
Basics of mathematics

### Educational Objectives
After taking part successfully, students have reached the following learning results

### Professional Competence

#### Knowledge
Students can to draw and explain circuit diagrams for electric and electronic circuits with a small number of components. They can describe the basic function of electric and electronic components and can present the corresponding equations. They can demonstrate the use of the standard methods for calculations.

#### Skills
Students are able to analyse electric and electronic circuits with few components and to calculate selected quantities in the circuits. They apply the usual methods of the electrical engineering for this.

### Personal Competence

#### Social Competence
none

#### Autonomy
Students are able independently to analyse electric and electronic circuits and to calculate selected quantities in the circuits.

### Workload in Hours
Independent Study Time 110, Study Time in Lecture 70

### Credit points
6

### Course achievement
None

### Examination
Written exam

### Examination duration and scale
135 minutes

### Assignment for the Following Curricula
- Bioprocess Engineering: Core qualification: Compulsory
- Energy and Environmental Engineering: Core qualification: Compulsory
- Logistics and Mobility: Core qualification: Compulsory
- Mechanical Engineering: Core qualification: Compulsory
- Orientierungsstudium: Core qualification: Elective Compulsory
- Naval Architecture: Core qualification: Compulsory
- Process Engineering: Core qualification: Compulsory
### Course L0290: Basics of Electrical Engineering

**Content**
- DC networks: Current, voltage, power, Kirchhoff's laws, equivalent sources, network analysis
- AC: Characteristics, RMS, complex representation, phasor diagrams, power
- Three phase AC: Characteristics, star-delta-connection, power, transformer
- Elektronics: Principle, operating behaviour and application of electronic devices as diode, Zener-diode, thyristor, transistor operational amplifier

**Literature**

| Professional Competence | The Non-technical Academic Programms (NTA) 
imparts skills that, in view of the TUHH’s training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor’s or Master’s level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses. |
| Knowledge | The Learning Architecture 
consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses. 
The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of “profiles” 
The subjects that can be studied in parallel throughout the student’s entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies. |
| Teaching and Learning Arrangements | provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses. |
| Fields of Teaching | are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migration studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor’s courses will have the opportunity to learn about business management and start-ups in a goal-oriented way. 
The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations. |
| The Competence Level | |
of the courses offered in this area is different as regards the basic training objective in the Bachelor’s and Master’s fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor’s and Master’s graduates in their future working life.

**Specialized Competence (Knowledge)**

Students can

- locate selected specialized areas with the relevant non-technical mother discipline,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,
- Can communicate in a foreign language in a manner appropriate to the subject.

**Professional Competence (Skills)**

In selected sub-areas students can

- apply basic methods of the said scientific disciplines,
- question a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple questions in aforementioned scientific disciplines in a successful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

**Personal Competences (Social Skills)**

Students will be able

- to learn to collaborate in different manner,
- to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,
- to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),
- to explain non-technical items to auditorium with technical background knowledge.

**Personal Competences (Self-reliance)**

Students are able in selected areas

- to reflect on their own profession and professionalism in the context of real-life fields of application
- to organize themselves and their own learning processes
- to reflect and decide questions in front of a broad education background
- to communicate a nontechnical item in a competent way in written form or verbally
- to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)

**Workload in Hours** Depends on choice of courses
| Credit points | 6 |

**Courses**

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

**Module Responsible**
Prof. Anusch Taraz

**Admission Requirements**
None

**Recommended Previous Knowledge**
School mathematics

**Educational Objectives**
After taking part successfully, students have reached the following learning results

### Professional Competence

#### Knowledge
- Students can name the basic concepts in analysis and linear algebra. They are able to explain them using appropriate examples.
- Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.
- They know proof strategies and can reproduce them.

#### Skills
- Students can model problems in analysis and linear algebra with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.
- Students are able to discover and verify further logical connections between the concepts studied in the course.
- For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.

### Personal Competence

#### Social Competence
- Students are able to work together in teams. They are capable to use mathematics as a common language.
- In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.

#### Autonomy
- Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.
- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.
### Course L1010: Analysis I

- **Typ:** Lecture
- **Hrs/wk:** 2
- **CP:** 2
- **Workload in Hours:** Independent Study Time 32, Study Time in Lecture 28
- **Lecturer:** Dozenten des Fachbereiches Mathematik der UHH
- **Language:** DE
- **Cycle:** WiSe

#### Content
- Foundations of differential and integrational calculus of one variable
  - statements, sets and functions
  - natural and real numbers
  - convergence of sequences and series
  - continuous and differentiable functions
  - mean value theorems
  - Taylor series
  - calculus
  - error analysis
  - fixpoint iteration

#### Literature

### Module Responsible
- Prof. Robert Seifried

### Admission
- None

### Recommended Previous Knowledge
- Solid school knowledge in mathematics and physics.

### Educational Objectives
- After taking part successfully, students have reached the following learning results

#### Professional Competence

**Knowledge**
- The students can
  - describe the axiomatic procedure used in mechanical contexts;
  - explain important steps in model design;
  - present technical knowledge in stereostatics.

**Skills**
- The students can
  - explain the important elements of mathematical / mechanical analysis and model formation, and apply it to the context of their own problems;
  - apply basic statical methods to engineering problems;
  - estimate the reach and boundaries of statical methods and extend them to be applicable to wider problem sets.

### Personal Competence

**Social Competence**
- The students can work in groups and support each other to overcome difficulties.

**Autonomy**
- Students are capable of determining their own strengths and weaknesses and to organize their time and learning based on those.

### Workload in Hours
- Independent Study Time 110, Study Time in Lecture 70

### Credit points
- 6

### Course achievement

### Module Responsible
- Prof. Jörg Weißmüller

### Admission Requirements
- None

### Recommended Previous Knowledge
- Highschool-level physics, chemistry und mathematics

### Educational Objectives
- After taking part successfully, students have reached the following learning results

#### Professional Competence

**Knowledge**
- The students have acquired a fundamental knowledge on metals, ceramics and polymers and can describe this knowledge comprehensively. Fundamental knowledge here means specifically the issues of atomic structure, microstructure, phase diagrams, phase transformations, corrosion and mechanical properties. The students know about the key aspects of characterization methods for materials and can identify relevant approaches for characterizing specific properties. They are able to trace materials phenomena back to the underlying physical and chemical laws of nature.

**Skills**
- The students are able to trace materials phenomena back to the underlying physical and chemical laws of nature. Materials phenomena here refers to mechanical properties such as strength, ductility, and stiffness, chemical properties such as corrosion resistance, and to phase transformations such as solidification, precipitation, or melting. The students can explain the relation between processing conditions and the materials microstructure, and they can account for the impact of microstructure on the material’s behavior.

### Content
- Motivation: „Atoms in Mechanical Engineering?“
- Basics: Force and Energy
- The electromagnetic Interaction
- „Detour“: Mathematics (complex e-funktion etc.)
- The atom: Bohr's model of the atom
- Chemical bounds
- The multi part problem: Solutions and strategies
- Descriptions of using statistical thermodynamics
- Elastic theory of atoms
- Consequences of atomar properties on makroskopic Properties: Discussion of examples (metals, semiconductors, hybrid systems)

## Module Responsible

Prof. Gerhard Schmitz

## Admission Requirements

None

## Recommended Previous Knowledge

Elementary knowledge in Mathematics and Mechanics

## Educational Objectives

After taking part successfully, students have reached the following learning results

### Professional Competence

**Knowledge**

Students are familiar with the laws of Thermodynamics. They know the relation of the kinds of energy according to 1st law of Thermodynamics and are aware about the limits of energy conversions according to 2nd law of Thermodynamics. They are able to distinguish between state variables and process variables and know the meaning of different state variables like temperature, enthalpy, entropy and also the meaning of exergy and anergy. They are able to draw the Carnot cycle in a Thermodynamics related diagram. They know the physical difference between an ideal and a real gas and are able to use the related equations of state. They know the meaning of a fundamental state of equation and know the basics of two phase Thermodynamics.

**Skills**

Students are able to calculate the internal energy, the enthalpy, the kinetic and the potential energy as well as work and heat for simple change of states and to use this calculations for the Carnot cycle. They are able to calculate state variables for an ideal and for a real gas from measured thermal state variables.

### Personal Competence

**Social Competence**

The students are able to discuss in small groups and develop an approach.

**Autonomy**

Students are able to define independently tasks, to get new knowledge from existing knowledge as well as to find ways to use the knowledge in practice.

**Content**
1. Introduction
2. Fundamental terms
3. Thermal Equilibrium and temperature
   3.1 Thermal equation of state
4. First law
   4.1 Heat and work
   4.2 First law for closed systems
   4.3 First law for open systems
   4.4 Examples
5. Equations of state and changes of state
   5.1 Changes of state
   5.2 Cycle processes
6. Second law
   6.1 Carnot process
   6.2 Entropy
   6.3 Examples
   6.4 Exergy
7. Thermodynamic properties of pure fluids
   7.1 Fundamental equations of Thermodynamics
   7.2 Thermodynamic potentials
   7.3 Calorific state variables for arbitrary fluids
   7.4 state equations (van der Waals u.a.)

## Recommended Previous Knowledge

Mechanics I

## Educational Objectives

After taking part successfully, students have reached the following learning results

### Professional Competence

**Knowledge**
- The students name the fundamental concepts and laws of statics such as stresses, strains, Hooke's linear law.
- The students apply the mathematical/mechanical analysis and modeling.
- The students apply the fundamental methods of elasto statics to simply engineering problems.
- The students estimate the validity and limitations of the introduced methods.

## Module Responsible
Prof. Dieter Krause

## Admission Requirements
None

## Recommended Previous Knowledge
- Basic knowledge about mechanics and production engineering
- Internship (Stage I Practical)

## Educational Objectives
After taking part successfully, students have reached the following learning results

### Professional Competence

#### Knowledge
After passing the module, students are able to:
- explain basic working principles and functions of machine elements,
- explain requirements, selection criteria, application scenarios and practical examples of basic machine elements, indicate the background of dimensioning calculations.

#### Skills
After passing the module, students are able to:
- accomplish dimensioning calculations of covered machine elements,
- transfer knowledge learned in the module to new requirements and tasks (problem solving skills),
- recognize the content of technical drawings and schematic sketches,
- technically evaluate basic designs.

### Personal Competence

#### Social Competence
Students are able to discuss technical information in the lecture supported by activating methods.

#### Autonomy
Students are able to independently deepen their acquired knowledge in exercises.
Students are able to acquire additional knowledge and to recapitulate poorly understood content e.g. by using the video recordings of the lectures.

Recommended Previous Knowledge
Mathematics I

Educational Objectives
After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge
- Students can name further concepts in analysis and linear algebra. They are able to explain them using appropriate examples.
- Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.
- They know proof strategies and can reproduce them.

Skills
- Students can model problems in analysis and linear algebra with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.
- Students are able to discover and verify further logical connections between the concepts studied in the course.
- For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.

Personal Competence

Social Competence
- Students are able to work together in teams. They are capable to use mathematics as a common language.
- In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.

Autonomy
- Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.
- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.

Prof. Dieter Krause

### Admission Requirements

None

### Recommended Previous Knowledge

- Fundamentals of Mechanical Engineering Design
- Mechanics
- Fundamentals of Materials Science
- Production Engineering

### Educational Objectives

After taking part successfully, students have reached the following learning results

#### Professional Competence

**Knowledge**

After passing the module, students are able to:

- explain complex working principles and functions of machine elements and of basic elements of fluidics,
- explain requirements, selection criteria, application scenarios and practical examples of complex machine elements,
- indicate the background of dimensioning calculations.

**Skills**

After passing the module, students are able to:

- accomplish dimensioning calculations of covered machine elements,
- transfer knowledge learned in the module to new requirements and tasks (problem solving skills),
- recognize the content of technical drawings and schematic sketches,
- evaluate complex designs, technically.

#### Personal Competence

**Social Competence**

- Students are able to discuss technical information in the lecture supported by activating methods.

**Autonomy**

- Students are able to independently deepen their acquired knowledge in exercises.
- Students are able to acquire additional knowledge and to recapitulate poorly understood content e.g. by using the video recordings of the lectures.

### Workload in Hours

| Independent Study Time | 68 |
| Study Time in Lecture | 112 |
| Credit points | 6 |

### Course achievement

None

### Examination

- **Written exam**

### Examination duration and scale

- General Engineering Science (German program, 7 semester): Specialisation Mechanical Engineering, Focus Aircraft Systems Engineering: Compulsory

[33]

**Workload in Hours**
- Independent Study Time: 32
- Study Time in Lecture: 28

**Lecturer**
- Prof. Dieter Krause, Prof. Otto von Estorff

**Language**
- DE

**Cycle**
- SoSe

### Content

**Advanced Mechanical Engineering Design I & II**

**Lecture**
- Fundamentals of the following machine elements:
  - Linear rolling bearings
  - Axes & shafts
  - Seals
  - Clutches & brakes
  - Belt & chain drives
  - Gear drives
  - Epicyclic gears
  - Crank drives
  - Sliding bearings
- Elements of fluidics

**Exercise**
- Calculation methods of the following machine elements:
  - Linear rolling bearings
  - Axes & shafts
  - Clutches & brakes
  - Belt & chain drives
  - Gear drives
  - Epicyclic gears
  - Crank gears
  - Sliding bearings
- Calculations of hydrostatic systems (fluidics)

**Module Responsible**

Prof. Dieter Krause

**Admission Requirements**

None

**Recommended Previous Knowledge**

- Fundamentals of Mechanical Engineering Design
- Mechanics
- Fundamentals of Materials Science
- Production Engineering

**Educational Objectives**

After taking part successfully, students have reached the following learning results

**Professional Competence**

After passing the module, students are able to:

**Knowledge**

- explain design guidelines for machinery parts e.g. considering load situation, materials and manufacturing requirements,
- describe basics of 3D CAD,
- explain basics methods of engineering designing.

**Skills**

- independently create sketches, technical drawings and documentations e.g. using 3D CAD,
- design components based on design guidelines autonomously,
- dimension (calculate) used components,
- use methods to design and solve engineering design tasks systematically and solution-oriented,
- apply creativity techniques in teams.

**Personal Competence**

After passing the module, students are able to:

**Social Competence**

- develop and evaluate solutions in groups including making and documenting decisions,
- moderate the use of scientific methods,
- present and discuss solutions and technical drawings within groups,
- reflect the own results in the work groups of the course.

**Autonomy**

- to estimate their level of knowledge using activating methods within the lectures (e.g. with clickers),
- To solve engineering design tasks systematically.

**Workload in Hours**

Independent Study Time 40, Study Time in Lecture 140

Module Responsible: Prof. Christoph Ihl

Admission Requirements: None

Recommended Previous Knowledge: Basic Knowledge of Mathematics and Business

Educational Objectives: After taking part successfully, students have reached the following learning results

Professional Competence: After taking this module, students know the important basics of many different areas in Business and Management, from Planning and Organisation to Marketing and Innovation, and also to Investment and Controlling. In particular they are able to

- explain the differences between Economics and Management and the sub-disciplines in Management and to name important definitions from the field of Management
- explain the most important aspects of and goals in Management and name the most important aspects of entrepreneurial projects
- describe and explain basic business functions as production, procurement and sourcing, supply chain management, organization and human resource management, information management, innovation management and marketing
- explain the relevance of planning and decision making in Business, esp. in situations under multiple objectives and uncertainty, and explain some basic methods from mathematical Finance
- state basics from accounting and costing and selected controlling methods.

Skills: Students are able to analyse business units with respect to different criteria (organization, objectives, strategies etc.) and to carry out an Entrepreneurship project in a team. In particular, they are able to

- analyse Management goals and structure them appropriately
- analyse organisational and staff structures of companies
- apply methods for decision making under multiple objectives, under uncertainty and under risk
- analyse production and procurement systems and Business information systems
- analyse and apply basic methods of marketing
- select and apply basic methods from mathematical finance to predefined problems
- apply basic methods from accounting, costing and controlling to predefined problems

Personal Competence: Students are able to

- work successfully in a team of students
- to apply their knowledge from the lecture to an entrepreneurship project and write a coherent report on the project
- to communicate appropriately and
- to cooperate respectfully with their fellow students.

Social Competence: Students are able to
Autonomy
- work in a team and to organize the team themselves
- to write a report on their project.

In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.

If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on self-selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the business knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

- Introduction to Business and Management, Business versus Economics, relevant areas in Business and Management
- Important definitions from Management,
- Developing Objectives for Business, and their relation to important Business functions
- Business Functions: Functions of the Value Chain, e.g. Production and Procurement, Supply Chain Management, Innovation Management, Marketing and Sales
- Cross-sectional Functions, e.g. Organisation, Human Resource Management, Supply Chain Management, Information Management
- Definitions as information, information systems, aspects of data security and strategic information systems
- Definition and Relevance of innovations, e.g. innovation opportunities, risks etc.
- Relevance of marketing, B2B vs. B2C-Marketing
- different techniques from the field of marketing (e.g. scenario technique), pricing strategies
- important organizational structures
- basics of human resource management
- Introduction to Business Planning and the steps of a planning process
- Decision Analysis: Elements of decision problems and methods for solving decision problems
- Selected Planning Tasks, e.g. Investment and Financial Decisions
- Introduction to Accounting: Accounting, Balance-Sheets, Costing
- Relevance of Controlling and selected Controlling methods
- Important aspects of Entrepreneurship projects

## Module Responsible

Prof. Robert Seifried

## Admission Requirements

None

## Recommended Previous Knowledge

Mathematics I, II, Mechanics I (Statics)

## Educational Objectives

### Professional Competence

#### Knowledge

The students can
- describe the axiomatic procedure used in mechanical contexts;
- explain important steps in model design;
- present technical knowledge in stereostatics.

#### Skills

The students can
- explain the important elements of mathematical / mechanical analysis and model formation, and apply it to the context of their own problems;
- apply basic hydrostatical, kinematic and kinetic methods to engineering problems;
- estimate the reach and boundaries of statical methods and extend them to be applicable to wider problem sets.

### Personal Competence

#### Social Competence

The students can work in groups and support each other to overcome difficulties.

#### Autonomy

Students are capable of determining their own strengths and weaknesses and to organize their time and learning based on those.

## Workload in Hours

Independent Study Time: 96, Study Time in Lecture: 84

## Credit points

6

## Module Responsible

Prof. Anusch Taraz

## Admission Requirements

None

## Recommended Previous Knowledge

Mathematics I + II

## Educational Objectives

After taking part successfully, students have reached the following learning results

### Professional Competence

**Knowledge**

- Students can name the basic concepts in the area of analysis and differential equations. They are able to explain them using appropriate examples.
- Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.
- They know proof strategies and can reproduce them.

**Skills**

- Students can model problems in the area of analysis and differential equations with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.
- Students are able to discover and verify further logical connections between the concepts studied in the course.
- For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.

### Personal Competence

- Students are able to work together in teams. They are capable to use mathematics as a common language.
- In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.

### Social Competence

- Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.
- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.

#### Workload in Hours
- Independent Study Time 32, Study Time in Lecture 28

**Lecturer**
- Dozenten des Fachbereiches Mathematik der UHH

**Language**
- DE

**Cycle**
- WiSe

#### Content
- Main features of differential and integrational calculus of several variables
  - Differential calculus for several variables
  - Mean value theorems and Taylor's theorem
  - Maximum and minimum values
  - Implicit functions
  - Minimization under equality constraints
  - Newton's method for multiple variables
  - Double integrals over general regions
  - Line and surface integrals
  - Theorems of Gauß and Stokes

</table>
1. Numerical Integration, Differentiation, Interpolation
   - Trapezoidal Rule, Simpson, Tschebyscheff, graphical Integration Methods
   - Determination of Areas, 1st and 2nd order Moments
   - Numerical Differentiation, Spline Interpolation

2. Buoyancy
   - Principle of Archimedes
   - Equilibrium Floating Condition
   - Equilibrium Computations
   - Hydrostatic Tables and Sounding Tables
   - Trim Tables

3. Stability at large heeling angles
   - Stability Equation
   - Cross Curves of Stability and Righting Levers
   - Numerical and Graphical Determination of Cross Curves
   - Heeling Moments of Free Surfaces, Water on Deck, Water Ingress
   - Heeling Moments of Different Type
   - Balance of Heeling and Righting Moments acc. to BV 1030
   - Intact Stability Code (General Criteria)

4. Linearization of Stability Problems
   - Linearization of Restoring Forces and Moments
   - Correlation between Metacentric Height and Righting Lever at small heeling angles
   - Computation of Path of Metacentric Height for Modern Hull Forms
   - Correlation between Righting Lever and Path of Metacentric Height
   - Hydrostatic Stiffness Matrix
   - Definition of MCT
   - Computation of Equilibrium Floating Conditions from Hydrostatic Tables
   - Effect of Free Surfaces on Initial GM
   - Roll Motions at Small Roll Angles

6. Stability in Waves
   - Roll Motions at Large Amplitudes
   - Pure Loss of Stability on the Wave Crest
   - Principle of Parametric Excitation
   - Principle of Direct Wave Moments
   - Grim’s Equivalent Wave Concept

6. Longitudinal Strength
7. Deadweight Survey and Inclining Experiment
- Displacement Computations from Draft mark Readings
- Weights to go on /come from board
- Inclining Experiment with Heeling Moments from Weights and Heeling Tanks
- Residual Sounding Volumes
- Determination of COG from Metacentric height and from Cross Curves
- Roll Decay Test

8. Launching and Docking
- Launching Plan, Arrangement of Launching Blocks
- Rigid Body Launching: Tilting, Dumping, Equation of Techel
- Computation of Launching Event
- Bottom Pressure and Longitudinal Strength
- Linear- Elastic Effects
- Transversal Stability on Slipway and in Dock

9. Grounding
- Loss of Buoyancy when Grounded
- Pointwise Grounding
- Ship Grounds on Keel

10. Introduction into Damage Stability Problems
- Added Mass Method
- Loss of Buoyant Volume Method
- Simple Equilibrium Computations
- Intermediate Stages of Flooding (Addes Mass Method), Cross- and Downflooding
- Water Ingress Through Openings

11. Special Problems (optional and agreed upon)
- e.g. Heavy Lift Operations
- e.g. Jacking of Jackup Vessels
- e.g. Sinking After Water Ingress

| **Content**       | As preparation for the lecture "Hydrostatics", the students must develop a body plan of a modern twin screw vessel (cruise liner, RoPAX- ferry, RoRo ) and perform elementary volumetric computations. The body plan is to be developed from a given GA or can be designed freely. All computations shall be based on graphical integration methods. The body plan consists of :
- Grid
- approx. 20 sections, 5 Waterlines, 5 Buttocks
- Computation Volume and centre of buoyancy for several drafts
- Computation of Righting Lever curve for a given displacement based on and graphical integration for several heeling angles. |

Module Responsible | Prof. Anusch Taraz

Admission Requirements | None

Recommended Previous Knowledge | Mathematics 1 - III

Educational Objectives

After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge

- Students can name the basic concepts in Mathematics IV. They are able to explain them using appropriate examples.
- Students can discuss logical connections between these concepts. They are capable of illustrating these connections with the help of examples.
- They know proof strategies and can reproduce them.

Skills

- Students can model problems in Mathematics IV with the help of the concepts studied in this course. Moreover, they are capable of solving them by applying established methods.
- Students are able to discover and verify further logical connections between the concepts studied in the course.
- For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate the results.

Personal Competence

Social Competence

- Students are able to work together in teams. They are capable to use mathematics as a common language.
- In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they can design examples to check and deepen the understanding of their peers.

Autonomy

- Students are capable of checking their understanding of complex concepts on their own. They can specify open questions precisely and know where to get help in solving them.
- Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on hard problems.

**Content**
- Main features of the theory and numerical treatment of partial differential equations
  - Examples of partial differential equations
  - First order quasilinear differential equations
  - Normal forms of second order differential equations
  - Harmonic functions and maximum principle
  - Maximum principle for the heat equation
  - Wave equation
  - Liouville's formula
  - Special functions
  - Difference methods
  - Finite elements

<tr>
<th>Educational Objectives</th>
<th>After taking part successfully, students have reached the following learning results</th>
</tr>
</thead>
</table>

| Professional Competence | Knowledge | Students will have the required sound knowledge to explain the general principles of fluid engineering and physics of fluids. Students can scientifically outline the rationale of flow physics using mathematical models and are familiar with methods for the performance analysis and the prediction of fluid engineering devices. |
|-------------------------|-----------|
|                         | Skills    | Students are able to apply fluid-engineering principles and flow-physics models for the analysis of technical systems. The lecture enables the student to carry out all necessary theoretical calculations for the fluid dynamic design of engineering devices on a scientific level. |
|                         | Social Competence | The students are able to discuss problems and jointly develop solution strategies. |
|                         | Autonomy   | The students are able to develop solution strategies for complex problems self-consistent and critically analyse results. |

**Workload in Hours**
- Independent Study Time: 78, Study Time in Lecture: 42

**Lecturer**
- Prof. Thomas Rung

**Language**
- DE

**Cycle**
- SoSe

**Content**
- Overview
- Physical/mathematical modelling
- Special phenomena
- Basic equations of fluid dynamics
- The turbulence problem
- One dimensional theory for incompressible flows
- One dimensional theory for compressible flows
- Flow over contours without friction
- Flow over contours with friction
- Flow through channels
- Simplified equations for three dimensional flow
- Special aspects of the numerical solution for complex flows

### Module Responsible
Prof. Moustafa Abdel-Maksoud

### Admission Requirements
None

### Recommended Previous Knowledge
- Technical mechanics
- Linear algebra, analysis, complex numbers
- Fluid mechanics

### Educational Objectives
After taking part successfully, students have reached the following learning results

### Professional Competence
**Knowledge**
- The students are able to give an overview over various manoeuvres. They can name application goals and they can describe the procedure of the manoeuvres.
- The students are able to give an overview over various rudder types. They can name criteria in the rudder design.
- The students can name computation methods which are used to determine forces and motions in waves.

**Skills**
- The students can come up with the equations of motions which are used to describe manoeuvres. The can use and linearise them.
- The students are able to determine hydrodynamic coefficients and they can explain their physical meaning.
- The students can explain how a rudder works and they can explain the physical effects which can occur.
- The students can mathematically describe waves.
- The students can explain the mathematically description of harmoncial motions in waves and they can determine them.

### Personal Competence

### Social Competence
- The students can discuss in groups and explain their point of view.

### Autonomy
- The students can assess their own strengths and weaknesses and the define further work steps on this basis.

### Workload in Hours
Independent Study Time 140, Study Time in Lecture 70

## Lecturer
Prof. Moustafa Abdel-Maksoud

## Language
DE

## Cycle
SoSe

## Content
- Maneuverability of ships
  - Equations of motion
  - Hydrodynamic forces and moments
  - Linear equations and their solutions
  - Full-scale trials for evaluating the maneuvering performance
  - Regulations for maneuverability
  - Rudder
- Seakeeping
  - Representation of harmonic processes
  - Motions of a rigid ship in regular waves
  - Flow forces on ship cross sections
  - Strip method
  - Consequences induced by ship motion in regular waves
  - Behavior of ships in a stationary sea state
  - Long-term distribution of seaway influences

Prof. Thomas Rung

Admission Requirements
None

Recommended Previous Knowledge
- Mathematical Methods for Engineers
- Fundamentals of Differential/integral calculus and series expansions

Educational Objectives
After taking part successfully, students have reached the following learning results

Professional Competence
Knowledge
The students are able to list the basic numerics of partial differential equations.

Skills
The students are able develop appropriate numerical integration in space and time for the governing partial differential equations. They can code computational algorithms in a structured way.

Personal Competence
Social Competence
The students can arrive at work results in groups and document them.

Autonomy
The students can independently analyse approaches to solving specific problems.

Workload in Hours

### Module Responsible
- Prof. Sören Ehlers

### Admission Requirements
- None

### Recommended Previous Knowledge
- Mechanics I - III
- Fundamentals of Materials Science I - III
- Welding Technology I
- Fundamentals of Mechanical Design I - III

### Educational Objectives
After taking part successfully, students have reached the following learning results:

#### Professional Competence
- **Knowledge**
  - Students can reproduce the basic contents of the structural behaviour of ship structures; they can explain the theory and methods for the calculation of deformations and stresses in beam-like structures.
  - Furthermore, they can reproduce the basis contents of codes (rules), materials, semi-finished products, joining and principles of structural design of components in the ship structure.
  - Students are capable of applying the methods and tools for the calculation of linear deformations and stresses in the above mentioned structures; they can choose calculation models of typical ship structures.
- **Skills**
  - Furthermore, they are capable to apply the methods of drawing and sizing the ship structure; they can select suitable materials, semi-finished products and joints.

#### Personal Competence
- **Social Competence**
  - The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.
  - The students are capable to independently idealize real ship structures and to select suitable methods for analysis of beam-like structures; they are capable to assess the results of structural analyses.
- **Autonomy**
  - Furthermore, they are capable to assess drawings of complex ship structures and to design ship structures for various requirements and boundary conditions.

### Workload in Hours

## Module Responsible

Prof. Sören Ehlers

## Admission Requirements

None

## Recommended Previous Knowledge

- Mechanics I - III
- Fundamentals of Materials Science I - III
- Welding Technology I
- Fundamentals of Mechanical Design I - III

## Educational Objectives

After taking part successfully, students have reached the following learning results

### Professional Competence

#### Knowledge

Students can reproduce design and sizing as well as fabrication of the different areas of ship structures and of different ship types (incl. detail design); they can describe calculation models for complex structures.

#### Skills

Students are capable to specify the requirements for different ship types and areas of the hull, to define design criteria for the components, to select suitable calculation models and to assess the chosen structure

### Personal Competence

#### Social Competence

Students are capable to present their structural design and discuss their decisions constructively in a group.

#### Autonomy

Students are capable to design independently different structural areas of the ship hull and different ship types and to define appropriate fabrication methods.

## Workload in Hours

**Cycle**
WiSe

**Content**
- phase transitions, phase diagrams and thermal activated processes
- fundamentals of steels, heat treatment applications for steels and time temperature transformation diagrams
- properties of weldable carbon and fine grained steels
- properties of weldable low- and high-alloy steels, corrosion resistant steels and high-strength steels
- structure and properties of non-ferrite metals (aluminum, titanium)
- NDT/DT Methods for materials and welds
- gas fusion welding, fundamentals of electric arc welding technologies
- structure and influence parameters for the welded joint
- submerged arc welding/tungsten inert gas welding/inert gas metal arc welding (MIG)/active gas metal arc welding (MAG)/Plasma Welding
- resistance welding/ polymer welding/ hybrid-welding
- deposition welding
- electron beam welding/laser beam welding
- weld joint designs and declarations
- computation methods for weld joint dimensioning

Module Responsible
Prof. Christopher Friedrich Wirz

Admission Requirements
None

Recommended Previous Knowledge
Thermodynamics, Mechanics, Machine Elements, Basics in Naval Architecture

Educational Objectives
After taking part successfully, students have reached the following learning results

Professional Competence
As a result of the part module „Fundamentals of Reciprocating Machinery”, the students are able to reflect fundamentals regarding power and working machinery and describe the qualitative and quantitative correlations of operating methods and efficiencies of multiple types of engines, compressors and pumps. They are able to utilize technical terms and parameters as well as aspects regarding the development of power density and efficiency, furthermore to give an overview of charging systems, fuels and emissions. The students are able to select specific types of machinery and assess design related and operational problems.

Knowledge
As a result of the part module “Fundamentals of Marine Engineering”, the students are able to describe the state-of-the-art regarding the wide range of propulsion components on ships and apply their knowledge. They further know how to analyze and optimize the interaction of the components of the propulsion system and how to describe complex correlations with the specific technical terms in German and English.

Skills
The students are skilled to employ basic and detail knowledge regarding reciprocating machinery, their selection and operation on board ships. They are further able to assess, analyse and solve technical and operational problems with propulsion and auxiliary plants and to design propulsion systems. The students have the skills to describe complex correlations and bring them into context with related disciplines.

Personal Competence

Social Competence
The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

Autonomy
The widespread scope of gained knowledge enables the students to handle situations in their future profession independently and confidently.

#### Module Responsible

Prof. Stefan Krüger

#### Admission Requirements

None

#### Recommended Previous Knowledge

- Mechanics
- Fluid Dynamics for Naval Architects
- Hydrostratics

#### Educational Objectives

After taking part successfully, students have reached the following learning results

#### Professional Competence

Knowledge

- Stillwater/added resistance
- Wave resistance
- Minimization of wave resistance
- Numerical prediction methods
- Friction laws
- Laminar/turbulent flow separation
- Hull form design for reduced flow separation
- Appendage Design and resistance
- Froude’s resistance law
- Form factor method
- Thrust deduction
- Wake
- Model scaling laws
- Resistance tests
- Free running propeller tests
- Propeller basics
- Propulsion tests
- Full scale speed power predictions
- Additional resistances (wind, steering, current, sea state)
- EEDI
- Speed trials
- Contractual matters concerning speed/power, bunker claims

Skills

The student shall learn to design competitive hull forms with respect to fuel consumption by applying numerical techniques and to evaluate these hulls by several prognosis methods. Furthermore, the course will enable the student to clearly determine and minimize the required power including environmental influences.

#### Personal Competence

Social Competence

The student learns to prepare technical matters in such a way that he can compete with his building supervision team.

Autonomy

The student learns to prepare technical matters in such a way that he can compete with his building supervision team.

#### Workload in Hours

- Independent Study Time: 124
- Study Time in Lecture: 56

Prof. Stefan Krüger

Admission Requirements

None

Recommended Previous Knowledge

• Fluid Dynamics for Naval Architects, Resistance and Propulsion
• Resistance and Propulsion, Hydrostatics

Educational Objectives

After taking part successfully, students have reached the following learning results

Professional Competence

The lecture starts with an overview about the importance and requirements of the early design phase. Competitive Elements of Ship Designs are thoroughly discussed. Typical building contracts and the related technical risk are introduced. The most important main parameters of a ship are introduced and their influence on the competitiveness of a design. The lecture focuses on the influence of alternated main parameters on the total performance of a ship design and the consecutive process elements. In this lecture, the design changes are dealt with by simple models or formulae. The student shall further learn to model complex systems properly so that the relevant technical conclusions can be drawn.

The lecture continues with an introduction into the different phases of design project, from the initial design phase to a building contract. Further, methods are introduced to generate building specification relevant information at different levels of granularity during the different design stages. In detail, the following topics are addressed:

- Structure of a building specification
- Determination of Light Ship Weight and Deadweight Components
- Design of main section and hull form
- Design of aftbody lines and maneuvering devices
- Design of main propulsion plant
- Design of subdivision
- Determination of limiting GMrequ- Curves
- Scantlings of most important structural members
- Longitudinal strength
- Outfitting Components
- Relevant rules and regulations

Skills

The student is made familiar with the basic design principles of seagoing merchant ships. The goal of the lecture is that the student shall be able to carry out a concept design based on a vessel of comparison fulfilling typical contract requirements within the Marine Environment.

The lecture deals with the basic design methods to determine the fundamental technical characteristics of a ship design with respect to fulfillment procedures of the contract values. Based on the lecture "Principles of Ship Design" the relevant methods to determine and judge upon the performance of a ship design are treated.

Personal Competence

The students learns to prepare technical matters in such a way he can persuade his potential customer against his competitors.

Social Competence

The students learns to prepare technical matters in such a way he can persuade his
Autonomy potential customer against his competitors.

### Admission Requirements
- According to General Regulations §21 (1):
  - At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.

### Recommended Previous Knowledge

### Educational Objectives
- After taking part successfully, students have reached the following learning results

#### Professional Competence
- **Knowledge**
  - The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods).
  - On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise.
  - The students are able to outline the state of research on a selected issue in their subject area.

- **Skills**
  - The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject-related problems.
  - With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.
  - The students can take up a critical position on the findings of their own research work from a specialized perspective.

#### Personal Competence
- **Social Competence**
  - Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way.
  - The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly.

- **Autonomy**
  - The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame.
  - The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.
  - The students can apply the essential techniques of scientific work to research of their own.
