Program description

Content

The Master Course "Naval Architecture and Ocean Engineering" prepares the graduates by solidifying their engineering, mathematical and natural science skills for scientific tasks in naval architecture, ocean engineering and related mechanical engineering disciplines. The graduates possess a critical awareness against new knowledge in their discipline, on which basis they are enabled to act responsible in their professional and societal environment. As a result of the elective modules it is possible to specialize in the following six disciplines: ship design, ship structural design and strength, fluid dynamics, ship machinery, ocean engineering as well as planning and production. Thus, the occupational orientation can either related to the design of ships or offshore systems, or to more dedicated areas, such as hydrodynamics or strength of structures.

Career prospects

The Master course strengthens the engineering, mathematical and natural science knowledge gained during the Bachelor education and conveys competences to solve problems in a systematic, scientific and independent fashion relevant for industry and research activities. The contents concern analysis, design and implementation methods for Ships and Offshore systems. The individual selection of the elective modules allows for a certain specialization while the mandatory courses secure a solid understanding of the general basics and in the related fields. Thereby the students are able to adjust their study contents individually according to their personal preferences. Further, the solid knowledge of the general basics and knowledge in the field related to the chosen specialisation allow for a broad professional expertise and thus a wide professional applicability. The graduates can take on scientific tasks at universities or research institutes with the aim of a doctoral dissertation or find their way directly into the industry. As for the latter, they may specialize in dedicated areas and with further experience and qualification they can take over leading roles.

Learning target

The graduates can analyse problems scientifically and solve them, even though they are not typical or only partially defined with conflicting objectives; complex tasks can be solved by abstracting from on-going research and development activities in their discipline; innovative and new methods can be used to find fundamental solutions; knowledge gaps can be identified and solutions can be proposed to overcome these gaps; theoretical and experimental investigations can be planned and executed; results can be analysed critically and conclusions can be drawn; emerging technologies can be analysed and reviewed. By doing so, they can classify knowledge from different disciplines systematically and thereby cope with complex problems. Further, they are able to reflect on the non-technical aspects of their engineering tasks responsibly. They can expand on the knowledge gained and develop further competences, also with the aim to succeed with a doctoral thesis. Consequently, the key skills from the preceding Bachelor education relevant for practical engineering tasks will be expanded in this Master course.

Program structure

This master course is modularized and follows the university-wide standard course structure with course modules of six credit points. The Master course combines the disciplines relevant for Naval Architecture and Ocean Engineering on the basis of the preceding Bachelor studies. Essential modules are mandatory for all students to allow for an even skill level among graduates. Further, students are able to personalize their studies due to the wide range of module options. The following modules comprise the mandatory core qualification with six credit points each:
- Structural Analysis of Ships and Offshore Structures
- Ship Vibration
  - Ship Safety
- Seakeeping of Ships and Laboratory on Naval Architecture
- Maritime Technology and Maritime Systems

The students further specialize by individually selecting six modules from the following options:
- Numerical Methods in Ship Design
- Port Logistics
- High-Order FEM
- Numerical Algorithms in Structural Mechanics
- Computational Fluid Dynamics II
- Computational Structural Dynamics
- Marine Diesel Engine Plants
- Ship propellers and cavitation
- Special topics of ship structural design
- Special Topics of Ship Propulsion and Hydrodynamics of High Speed Water Vehicles
- Selected topics in Naval Architecture and Ocean Engineering (Open module with further topic selection)
- Fatigue Strength of Ships and Offshore Structures
- Arctic Technology
- Innovative CFD Approaches
- Maneuuvability and Shallow Water Ship Hydrodynamics
- Nonlinear Structural Analysis
- Advanced Ship Design
- Vibration Theory
- Marine Auxiliaries

Additionally, the open module "Business & Management" and "Nontechnical Elective Complementary Courses for Master" with six credit points each is mandatory. Finally, in addition to the master thesis, the students must complete a research project:
- Research Project (12 credits)
- Master Thesis (30 credits)

### Professional Competence

**Knowledge**
- Students are able to find their way around selected special areas of management within the scope of business management.
- Students are able to explain basic theories, categories, and models in selected special areas of business management.
- Students are able to interrelate technical and management knowledge.

**Skills**
- Students are able to apply basic methods in selected areas of business management.
- Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.

### Personal Competence

**Social Competence**
- Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.

**Autonomy**

### Workload in Hours
Depends on choice of courses

### Credit points
6

### Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.
Module M0524: Nontechnical Elective Complementary Courses for Master

Module Responsible: Dagmar Richter

Admission Requirements: None

Recommended Previous Knowledge: None

Educational Objectives: After taking part successfully, students have reached the following learning results

Professional Competence Knowledge

- The Nontechnical Academic Program (NTA) imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

- consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programs follow the specific profiling of TUHH degree courses.

- The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

- The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

- provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

- are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

- The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goal-oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

- of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

- Students can explain specialized areas in context of the relevant non-technical disciplines,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity.
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills

- Professional Competence (Skills)

- In selected sub-areas students can apply basic and specific methods of the said scientific disciplines,
- acquisition a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist discipline,
- to handle simple and advanced questions in aforementioned scientific disciplines in a successful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

- Personal Competence (Social Skills)

- Students will be able to learn to collaborate in different manner,
- to present and analyze problems in the above-mentioned fields in a partner or group situation in a manner appropriate to the addressees,
to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),
- to explain nontechnical items to auditorium with technical background knowledge.

**Autonomy**

**Personal Competences (Self-reliance)**

Students are able in selected areas

- to reflect on their own profession and professionalism in the context of real-life fields of application
- to organize themselves and their own learning processes
- to reflect and decide questions in front of a broad education background
- to communicate a nontechnical item in a competent way in written form or verbally
- to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)

Cycle
SoSe

Content
The lecture starts with the definition of the early design phase and the importance of first principle approaches. The reasons for process reengineering when such kinds of methods are introduced is demonstrated. Several numerical modelling techniques are introduced and discussed for the following design relevant topics:
- Hullform representation, fairing and interpolation
- Hullform design by modifying parent hulls
- Modelling of subdivision
- Volumetric and stability calculations
- Mass distributions and longitudinal strength
- Hullform Design by CFD techniques
- Propulsor and Rudder Design by CFD Techniques

Module Responsible: Prof. Alexander Düster

Admission Requirements: None

Recommended Previous Knowledge:
- Differential Equations 2 (Partial Differential Equations)

Educational Objectives: After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge: Students are able to
- give an overview of the basics of structural mechanics for the analysis of ships and offshore structures.
- explain structural models for thin-walled structures.
- specify problems of linear structural analysis, to identify them in a given situation and to explain their mathematical and mechanical background.
- classify finite elements with respect to their suitability for the structural analysis of ships and offshore structures.

Skills: Students are able to
- model linear structural problems of ships and offshore structures.
- select a suitable finite element formulation for a given linear problem of structural mechanics.
- apply finite element procedures to the linear structural analysis of ships and offshore structures.
- verify and critically judge the results of linear finite element computations.
- transfer their knowledge of linear structural analysis with finite elements to new problems.

Personal Competence

Social Competence: Students are able to
- solve problems in heterogeneous groups and to document the corresponding results.
- share new knowledge with group members.

Autonomy: Students are able to
- assess their knowledge by means of exercises and E-Learning.

**Module Responsible**

Dr. Rüdiger Ulrich Franz von Bock und Polach

**Admission Requirements**

None

**Recommended Previous Knowledge**

- Mechanics I - III
- Structural Analysis of Ships I
- Fundamentals of Ship Structural Design

**Educational Objectives**

After taking part successfully, students have reached the following learning results

**Professional Competence**

**Knowledge**

- Students can reproduce the acceptance criteria for vibrations on ships; they can explain the methods for the calculation of natural frequencies and forced vibrations of structural components and the entire hull girder; they understand the effect of exciting forces of the propeller and main engine and methods for their determination

**Skills**

- Students are capable to apply methods for the calculation of natural frequencies and exciting forces and resulting vibrations of ship structures including their assessment; they can model structures for the vibration analysis

**Personal Competence**

**Social Competence**

- The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

**Autonomy**

- Students are able to detect vibration-prone components on ships, to model the structure, to select suitable calculation methods and to assess the results

**Workload in Hours**

- Independent Study Time: 124
- Study Time in Lecture: 56

**Credit points**

- 6

**Examination**

- Written exam
- Duration: 3 hours

**Assignment for the Following Curricula**

- Energy Systems: Specialisation Marine Engineering: Elective Compulsory
- Naval Architecture and Ocean Engineering: Core qualification: Compulsory
- Ship and Offshore Technology: Core qualification: Compulsory
- Theoretical Mechanical Engineering: Specialisation Maritime Technology: Elective Compulsory
- Theoretical Mechanical Engineering: Technical Complementary Course: Elective Compulsory

#### Module Responsible
Prof. Stefan Krüger

#### Admission Requirements
None

#### Recommended Previous Knowledge
Ship Design, Hydrostatics, Statistical Processes

#### Educational Objectives
After taking part successfully, students have reached the following learning results

**Professional Competence**

Knowledge
- The student shall lean to integrate safety aspects into the ship design process. This includes the understanding and application of existing rules as well as the understanding of the safety concept and level which is targeted by a rule.
- Further, methods of demonstrating equivalent safety levels are introduced.

Skills
- The lectures start with an overview about general safety concepts for technical systems. The maritime safety organizations are introduced, their responses and duties. Then, the general difference between prescriptive and performance-based rules is tackled. For different examples in ship design, the influence of the rules on the design is illustrated. Further, limitations of safety rules with respect to the physical background are shown. Concepts of demonstrating equivalent levels of safety by direct calculations are discussed. The following fields will be treated:
  - Freeboard, watertight subdivisions, openings
  - All aspects of intact stability, including special problems such as grain code
  - Damage stability for passenger vessels including Stockholm agreement
  - Damage stability for cargo vessels
  - On-board stability, inclining experiment and stability booklet
  - Relevant manoeuvring information

**Personal Competence**

Social Competence
- The student learns to take responsibility for the safety of his design.

Autonomy
- Responsible certification of technical designs.

Module Responsible: Prof. Moustafa Abdel-Maksoud

Admission Requirements: None

Recommended Previous Knowledge: Basic knowledge of ship dynamics as well as stochastic and statistics

Educational Objectives:

After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge

- Understand present research questions in the field of ship motion in waves
- Explain the present state of the art for the topics considered
- Apply given methodology to approach given problems of seakeeping behavior
- Evaluate the limits of the present methods
- Identify possibilities to extend present methods
- Evaluate the feasibility of further developments

Skills

Students are able to

- select and apply suitable computing and simulation methods to determine the dynamic loads on ships and floating bodies
- model the behavior of ships and floating bodies under different sea conditions by using simplified methods
- evaluate critically the investigation results of experimental or numerical studies

Personal Competence

Students are able to

- solve problems in heterogeneous groups and to document the corresponding results
- share new knowledge with group members

Social Competence

Students are able to

- think system-oriented
- decompose complex systems

Autonomy

Students are able to

- assess their knowledge by means of exercises

Workload in Hours

Independent Study Time: 96, Study Time in Lecture: 84

Credit points: 6

Examination:
Written exam

Workload in Hours:
Independent Study Time: 32, Study Time in Lecture: 28

Lecturer: Prof. Thomas Rung

Language: DE/EN

Cycle: SoSe

Content:
The lab is structured into 5 team-based experiments

1. Resistance test
   - Towing test to investigate a model hull resistance
2. Propulsion test
   - Propulsion test for a self-propelled hull. Determination of thrust deduction, wake fraction and propulsion efficiency.
3. Seakeeping test
   - Investigation of the seakeeping behaviour
4. Open water and cavitation test
   - Compilation of an open water diagram and cavitation experiments
5. Application of strain measurement techniques

Theoretical instructions will also involve foundations of similarity analysis

Literature:

- Vorlesungsmanuskript
- Lecture Notes

</tbody>
</table>

Module Responsible: Prof. Moustafa Abdel-Maksoud

Admission Requirements: None

Recommended Previous Knowledge: Solid knowledge and competences in mechanics, fluid dynamics and analysis (series, periodic functions, continuity, differentiability, integration, multiple variables, ordinary and partial differential equations, boundary value problems, initial conditions and eigenvalue problems).

Educational Objectives: After taking part successfully, students have reached the following learning results.

Professional Competence

Knowledge: After successful completion of this class, students should have an overview about phenomena and methods in ocean engineering and the ability to apply and extend the methods presented.

- describe the different aspects and topics in Maritime Technology,
- apply existing methods to problems in Maritime Technology,
- discuss limitations in present day approaches and perspectives in the future,
- Techniques for the analysis of offshore systems,
- Modeling and evaluation of dynamic systems,
- System-oriented thinking, decomposition of complex systems.

Skills: The students learn the ability of apply and transfer existing methods and techniques on novel questions in maritime technologies. Furthermore, limits of the existing knowledge and future developments will be discussed.

Personal Competence

Social Competence: The processing of an exercise in a group of up to four students shall strengthen the communication and team-working skills and thus promote an important working technique of subsequent working days. The collaboration has to be illustrated in a community presentation of the results.

Autonomy: The course contents are absorbed in an exercise work in a group and individually checked in a final exam in which a self-reflection of the learned is expected without tools.

Workload in Hours

- Independent Study Time: 32 hours
- Study Time in Lecture: 28 hours

Credit points: 6

Examination duration and scale: 180 min

Assignment for the Following Curricula:

- Naval Architecture and Ocean Engineering: Core qualification: Compulsory
- Theoretical Mechanical Engineering: Specialisation Maritime Technology: Elective Compulsory
- Theoretical Mechanical Engineering: Technical Complementary Course: Elective Compulsory

Workload in Hours: Independent Study Time 32, Study Time in Lecture 28

Lecturer: Prof. Moustafa Abdel-Maksoud, Dr. Alexander Mitzlaff

Language: DE

Cycle: SoSe

Content:

1. Hydrostatic analysis
   - Buoyancy,
   - Stability,
2. Hydrodynamic analysis
   - Froude-Krylov force
   - Morison’s equation,
   - Radiation and diffraction
   - transparent/compact structures
3. Evaluation of offshore structures: Reliability techniques (security, reliability, disposability)
   - Short-term statistics
   - Long-term statistics and extreme events

Literature:

- E. V. Lewis (Editor), Principles of Naval Architecture, SNAME, 1988
- Journal of Offshore Mechanics and Arctic Engineering
- Proceedings of International Conference on Offshore Mechanics and Arctic Engineering
- S. Chakrabart (Ed.), Handbook of Offshore Engineering, Volumes 1-2, Elsevier, 2005

Independent Study Time 62, Study Time in Lecture 28

**Lecturer**
Prof. Moustafa Abdel-Maksoud

**Language**
DE

**Cycle**
SoSe

**Content**
- Phenomenon and type of cavitation
- Test facilities and instrumentations
- Dynamics of bubbles
- Bubbles cavitation
- Supercavitation
- Ventilated supercavities
- Vortex cavitation
- Sheet cavitation
- Cavitation in rotary machines
- Numerical cavitation models I
- Numerical cavitation models II
- Pressure fluctuation
- Erosion and noise

**Literature**
### Course L1270: Marine Propellers

<table>
<thead>
<tr>
<th>Typ</th>
<th>Problem-based Learning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hrs/wk</td>
<td>2</td>
</tr>
<tr>
<td>CP</td>
<td>1</td>

</tbody>
</table>

**Workload in Hours**
- Independent Study Time 2
- Study Time in Lecture 28

**Lecturer**
- Prof. Stefan Krüger

**Language**
- DE

**Cycle**
- SoSe

**Content**
- The lectures start with the description of the propeller blade outline parameters. The design fundamentals for the blade parameters are introduced. The momentum theory for screw propellers is treated. The design optimization of the propeller by means of systematic propeller series is considered. The lecture then treats the profile theory of the airfoil with infinite span (singularity methods) for the most common technical profiles. Lifting line theory is introduced as calculation tool for radial circulation distribution. The lecture continues with the interaction propeller and main propulsion plant. Strategies to control a CPP are discussed. The lecture closes with the most important cavitation phenomena which are relevant for the determination of pressure fluctuations.

**Literature**
- W.H. Isay, Propellertheorie, Springer Verlag.

### Module Responsible
Prof. Alexander Düster

### Admission Requirements
None

### Recommended Previous Knowledge
- Differential Equations 2 (Partial Differential Equations)

### Educational Objectives
After taking part successfully, students have reached the following learning results

#### Professional Competence

**Knowledge**

Students are able to

- give an overview of the different (h, p, hp) finite element procedures.
- explain high-order finite element procedures.
- specify problems of finite element procedures, to identify them in a given situation and to explain their mathematical and mechanical background.

**Skills**

Students are able to

- apply high-order finite elements to problems of structural mechanics.
- select for a given problem of structural mechanics a suitable finite element procedure.
- critically judge results of high-order finite elements.
- transfer their knowledge of high-order finite elements to new problems.

#### Personal Competence

**Social Competence**

Students are able to

- solve problems in heterogeneous groups and to document the corresponding results.

**Autonomy**

Students are able to

- assess their knowledge by means of exercises and E-Learning.
- acquaint themselves with the necessary knowledge to solve research oriented tasks.

### Workload in Hours

- Independent Study Time: 124
- Study Time in Lecture: 56

### Credit points

- 6

### Examination

- Written exam
- Examination duration and scale: 120 min

### Assignment for the Following Curricula

- Energy Systems: Core qualification: Elective Compulsory
- International Management and Engineering: Specialisation II, Product Development and Production: Elective Compulsory
- Materials Science: Specialisation Modeling: Elective Compulsory
- Mechanical Engineering and Management: Specialisation Product Development and Production: Elective Compulsory
- Mechatronics: Technical Complementary Course: Elective Compulsory
- Product Development, Materials and Production: Core qualification: Elective Compulsory

### Module Responsible

Prof. Alexander Düster

### Admission Requirements

None

### Recommended Previous Knowledge

- Differential Equations 2 (Partial Differential Equations)

### Educational Objectives

**Professional Competence**

**Knowledge**

Students are able to:
- give an overview of the standard algorithms that are used in finite element programs.
- explain the structure and algorithm of finite element programs.
- specify problems of numerical algorithms, to identify them in a given situation and to explain their mathematical and computer science background.

**Skills**

Students are able to:
- construct algorithms for given numerical methods.
- select for a given problem of structural mechanics a suitable algorithm.
- apply numerical algorithms to solve problems of structural mechanics.
- implement algorithms in a high-level programming language (here C++).
- critically judge and verify numerical algorithms.

**Personal Competence**

**Social Competence**

Students are able to:
- solve problems in heterogeneous groups and to document the corresponding results.

**Autonomy**

Students are able to:
- assess their knowledge by means of exercises and E-Learning.

### Workload in Hours

### Module Responsible
Prof. Christopher Friedrich Wirz

### Admission Requirements
None

### Recommended Previous Knowledge

### Educational Objectives
After taking part successfully, students have reached the following learning results

#### Professional Competence

**Knowledge**
- Students can explain different types four / two-stroke engines and assign types to given engines,
- They name definitions and characteristics, as well as
- They elaborate on special features of the heavy oil operation, lubrication and cooling.

**Skills**
- Students can evaluate the interaction of ship, engine and propeller,
- Use relationships between gas exchange, flushing, air demand, charge injection and combustion for the design of systems,
- Design waste heat recovery, starting systems, controls, automation, foundation and design machinery spaces, and
- Apply evaluation methods for excited motor noise and vibration.

#### Personal Competence

**Social Competence**
- The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

**Autonomy**
- The widespread scope of gained knowledge enables the students to handle situations in their future profession independently and confidently.

### Workload in Hours

#### Module Responsible
Prof. Carlos Jahn

#### Admission Requirements
None

#### Recommended Previous Knowledge
none

#### Educational Objectives
After taking part successfully, students have reached the following learning results

**Professional Competence**

- The students are able to...
  - describe the historical port development (regarding port functions, port terminals and the corresponding operating models) and consider these facts in the historical contest;
  - explain different types of seaport terminals and their typical characteristics (type of cargo, handling and transportation equipment, functional areas);
  - name typical planning and scheduling tasks (e.g. berth planning, stowage planning, yard planning) as well as corresponding approaches (methods and tools) for port tasks in seaport terminals;
  - name and discuss trends regarding planning and scheduling in innovative seaport terminals.

**Skills**

- The students are able to...
  - recognise functional areas within seaports and within seaport terminals;
  - define and assess possible operation systems for a container terminal;
  - conduct static calculations of container terminals regarding capacity requirements based on given conditions;
  - reliably estimate how certain conditions effect typical logistics metrics in the context of the static planning process of selected seaport terminals.

**Personal Competence**

- The students are able to...
  - discuss and organise extensive work packages in groups;
  - document and present the elaborated results.

**Social Competence**

- The students are able to...

**Autonomy**

- The students are able to...
  - research and select technical literature as well as norms and guidelines
  - to hand in on time and to present an own share of a considerable written scientific work which was compiled in a small team together with other students

<td>The outstanding role of maritime transport for international trade requires efficient ports. These must meet numerous requirements in terms of profitability, speed, safety and environment. Recognising this, port logistics contains the planning, management, operation and control of material flows and the corresponding information flows in the system and its interfaces to several actors within and outside the port area. The course “Port Logistics” aims to provide skills to comprehend structures and processes in ports. It focuses on different terminal types, their characteristic layouts, the technical equipment which is used and the interaction between the actors.</td>

<td>The exercise lesson focuses on analytical tasks in the field of terminal planning. During the exercise lesson, the students work in small groups on designing terminal layouts under consideration of given conditions. The calculated logistics metrics, respectively the corresponding terminal layouts must be illustrated in 2D and 3D using special planning software.</td>

Module Responsible: Prof. Sören Ehlers

Admission Requirements: None

Recommended Previous Knowledge: None

Educational Objectives:

Professional Competence

Knowledge
- Students are able to find their way through selected special areas within naval architecture and ocean engineering.
- Students are able to explain basic models and procedures in selected special areas.
- Students are able to interrelate scientific and technical knowledge.

Skills
- Students are able to apply basic methods in selected areas of ship and ocean engineering.

Personal Competence

Social Competence
- The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

Autonomy
- Students can choose independently, in which fields they want to deepen their knowledge and skills through the election of courses.

Workload in Hours
- Depends on choice of courses

Credit points: 6

Assignment for the Following Curricula: Naval Architecture and Ocean Engineering: Core qualification: Elective Compulsory

Workload in Hours
- Independent Study Time 62, Study Time in Lecture 28

Examination Form: Mündliche Prüfung

Examination duration and scale: 30 min

Lecturer: Prof. Sören Ehlers, Dr. Hendrik Vorhölter

Language: DE

Cycle: SoSe

Content:
The lecture is separated into two parts. In the first part some basic skills necessary for the design of offshore vessels and their equipment will be repeated and where necessary deepened. In particular, the specialties which are common for the majority of offshore vessels will be addressed: rules and regulations, determination of operational limits as well as mooring and dynamic positioning.

In the second part of the lecture single types of special offshore vessels and their equipment and outfitting will be addressed. For each type the specific requirements on design and operation will be discussed. Furthermore, the students shall be engaged with the preparation of short presentation about the specific ship types as incentive for the respective unit. In particular, it is planned to discuss the following ship types in the lecture:
- Anchor handling and plattform supply vessels
- Cable -and pile lay vessels
- Jack-up vessels
- Heavy lift and offshore construction vessels
- Dredgers and rock dumping vessels
- Diving support vessels

---

</tbody>
</table>

**Content**
The lectures will give an overview about the design of underwater vessels. The Topics are:

1. Special requirements on the design of modern, conventional submarines
2. Design history
3. General description of submarines
4. Civil submarines
5. Diving, trim, stability
6. Rudders and propulsion systems
7. Air independent propulsion
8. Signatures
9. Hydrodynamics and CFD
10. Weapon and combat management systems
11. Safety and rescue
12. Fatigue and shock
13. Ships technical systems
14. Electrical systems and automation
15. Logistics
16. Accommodation

Some of the lectures will be held in form of an excursion to ThyssenKrupp Marine Systems in Kiel

**Examination Form**
Mündliche Prüfung

**Examination duration and scale**
30 min

**Lecturer**
Prof. Thomas Rung, Peter Schenzle

**Language**
DE/EN

**Cycle**
WiSe

**Content**
- Principles of Sailing Mechanics:
  - Sailing: Propulsion from relative motion
  - Lifting foils: Sails, wings, rudders, fins, keels
  - Wind climate: global, seasonal, meteorological, local
  - Aerodynamics of sails and sailing rigs
  - Hydrodynamics of Hulls and fins

- Technical Elements of Sailing:
  - Traditional and modern sail types
  - Modern and unconventional wind propulsors
  - Hull forms and keel-rudder-configurations
  - Sailing performance prediction (VPP)
  - Auxiliary wind propulsion (motor-sailing)

- Configuration of Sailing Ships:
  - Balancing hull and sailing rig
  - Sailing-boats and -yachts
  - Traditional Tall Sailing Ships
  - Modern Wind-Ships

## Module Responsible
Prof. Sören Ehlers

### Admission Requirements
None

### Recommended Previous Knowledge
Schiffskonstruktion I - II

### Educational Objectives
After taking part successfully, students have reached the following learning results:

#### Professional Competence
**Knowledge**
- Design of special ship and offshore structures can be explained by means of their properties including the usage of lightweight materials and structures.
- Further, possible extreme loads can be explained.

**Skills**
- Methods to design special ship and offshore structures can be used and the usage of lightweight and sandwich structures can be evaluated. Further, methods to assess the structural response under extreme loads can be used.

#### Personal Competence
**Social Competence**
- Students are capable to present their structural design and discuss their decisions constructively in a group.

**Autonomy**
- Independent and individual assignment tasks can be carried out and presented whereby the capabilities to both, present and defend, the skills and findings will be achieved.

### Workload in Hours
- Independent Study Time: 124
- Study Time in Lecture: 56

### Credit points
6

### Examination
- Oral exam
- Examination duration and scale: 30 min

### Assignment for the Following Curricula
Naval Architecture and Ocean Engineering: Core qualification: Elective Compulsory

## Course L1571: Special topics of ship structural design

<table>
<thead>
<tr>

### Workload in Hours
- Independent Study Time: 62
- Study Time in Lecture: 28

### Lecturer
Prof. Sören Ehlers

### Language
DE/EN

### Cycle
SoSe

### Content
- The characteristics of specialised ship types and offshore structures will be explained as well as their structural design considering service and extreme loads. Possible ship types are: RoRo's, Passenger ships, multi-purpose bulker, gas tanker, FPSO's and fast vessels. Further, the use of alternative materials to steel, such as aluminium, fibre reinforced plastics and sandwich constructions, will be explained. The extreme loads will cover: ship collisions, grounding, ice, low temperature, explosions and fire.

Module Responsible
Prof. Moustafa Abdel-Maksoud

Admission Requirements
None

Recommended Previous Knowledge
Basic knowledge on ship resistance, ship propulsion and propeller theory

Educational Objectives
After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge
- Understand present research questions in the field of ship propulsion
- Explain the present state of the art for the topics considered
- Apply given methodology to approach given problems
- Evaluate the limits of the present ship propulsion systems
- Identify possibilities to extend present methods and technologies
- Evaluate the feasibility of further developments

Skills
Students are able to
- select and apply suitable computing and simulation methods to determine the hydrodynamic characteristics of ship propulsion systems
- model the behavior of ship propulsion systems under different operation conditions by using simplified methods
- evaluate critically the investigation results of experimental or numerical investigations

Personal Competence

Social Competence
Students are able to
- solve problems in heterogeneous groups and to document the corresponding results
- share new knowledge with group members

Autonomy
Students are able to assess their knowledge by means of exercises and case studies

Workload in Hours

Independent Study Time 96, Study Time in Lecture 84

- The lecture is separated into two parts. In the first part some basic skills necessary for the design of offshore vessels and their equipment will be repeated and where necessary deepened. In particular, the specialties which are common for the majority of offshore vessels will be addressed: rules and regulations, determination of operational limits as well as mooring and dynamic positioning.

In the second part of the lecture single types of special offshore vessels and their equipment and outfitting will be addressed. For each type the specific requirements on design and operation will be discussed. Furthermore, the students shall be engaged with the preparation of short presentation about the specific ship types as incentive for the respective unit. In particular, it is planned to discuss the following ship types in the lecture:
- Anchor handling and platfform supply vessels
- Cable - and pile lay vessels
- Jack-up vessels
- Heavy lift and offshore construction vessels
- Dredgers and rock dumping vessels
- Diving support vessels

**Workload in Hours**: Independent Study Time 62, Study Time in Lecture 28

**Examination Form**: Mündliche Prüfung

**Examination duration and scale**: 30 min

**Lecturer**: Peter Hauschildt

**Language**: DE

**Cycle**: SS18

**Content**

The lectures will give an overview about the design of underwater vessels. The Topics are:

1. Special requirements on the design of modern, conventional submarines
2. Design history
3. General description of submarines
4. Civil submarines
5. Diving, trim, stability
6. Rudders and Propulsion systems
7. Air Independent propulsion
8. Signatures
9. Hydrodynamics and CFD
10. Weapon- and combat management systems
11. Safety and rescue
12. Fatigue and shock
13. Ships technical systems
14. Electrical Systems and automation
15. Logistics
16. Accommodation

Some of the lectures will be held in form of an excursion to ThyssenKrupp Marine Systems in Kiel

**Literature**

**Workload in Hours**: Independent Study Time 62, Study Time in Lecture 28

**Examination Form**: Mündliche Prüfung

**Examination duration and scale**: 45 min

**Lecturer**: Dr. Alexander Mitzlaff

**Language**: DE

**Cycle**: WiSe

**Content**

- Nonlinear Waves: Stability, pattern formation, solitary states
- Bottom Boundary layers: wave boundary layers, scour, stability of marine slopes
- Ice-structure interaction
- Wave and tidal current energy conversion

**Literature**

- Research Articles.
### Course L1605: Ship Acoustics

**Content**
- Principles of Sailing Mechanics:
  - Sailing: Propulsion from relative motion
  - Lifting foils: Sails, wings, rudders, fins, keels
  - Wind climate: global, seasonal, meteorological, local
  - Aerodynamics of sails and sailing rigs
  - Hydrodynamics of Hulls and fins
- Technical Elements of Sailing:
  - Traditional and modern sail types
  - Modern and unconventional wind propulsors
  - Hull forms and keel-rudder-configurations
  - Sailing performance Prediction (VPP)
  - Auxiliary wind propulsion (motor-sailing)
- Configuration of Sailing Ships:
  - Balancing hull and sailing rig
  - Sailing-boats and -yachts
  - Traditional Tall Sailing Ships
  - Modern Wind-Ships

### Module Responsible
Prof. Alexander Düster

### Admission Requirements
None

### Recommended Previous Knowledge
- Differential Equations 2 (Partial Differential Equations)

### Educational Objectives
After taking part successfully, students have reached the following learning results

### Professional Competence

#### Knowledge
- Students are able to
  - give an overview of the different nonlinear phenomena in structural mechanics.
  - explain the mechanical background of nonlinear phenomena in structural mechanics.
  - to specify problems of nonlinear structural analysis, to identify them in a given situation and to explain their mathematical and mechanical background.

#### Skills
- Students are able to
  - model nonlinear structural problems.
  - select for a given nonlinear structural problem a suitable computational procedure.
  - apply finite element procedures for nonlinear structural analysis.
  - critically verify and judge results of nonlinear finite elements.
  - to transfer their knowledge of nonlinear solution procedures to new problems.

### Personal Competence

#### Social Competence
- Students are able to
  - solve problems in heterogeneous groups and to document the corresponding results.
  - share new knowledge with group members.

#### Autonomy
- Students are able to
  - assess their knowledge by means of exercises and E-Learning.

### Workload in Hours

| Independent Study Time | 124 |
| Study Time in Lecture | 56 |

### Credit points
6

### Examination

- Written exam
- Examination duration and scale: 120 min

### Assignment for the Following Curricula
- Civil Engineering: Specialisation Structural Engineering: Elective Compulsory
- International Management and Engineering: Specialisation II: Civil Engineering: Elective Compulsory
- Materials Science: Specialisation Modeling: Elective Compulsory
- Mechatronics: Specialisation System Design: Elective Compulsory
- Product Development, Materials and Production: Core qualification: Elective Compulsory
- Naval Architecture and Ocean Engineering: Core qualification: Elective Compulsory
- Ship and Offshore Technology: Core qualification: Elective Compulsory
- Theoretical Mechanical Engineering: Core qualification: Elective Compulsory
- Theoretical Mechanical Engineering: Technical Complementary Course: Elective Compulsory

### Module Responsible
Prof. Thomas Rung

### Admission Requirements
None

### Recommended Previous Knowledge
- Attendance of a computational fluid dynamics course (CFD1/CFD2)
- Competent knowledge of numerical analysis in addition to general and computational thermo/fluid dynamics

### Educational Objectives
After taking part successfully, students have reached the following learning results

**Professional Competence**

- Knowledge: Student can explain the theoretical background of different CFD strategies (e.g. Lattice-Boltzmann, Smoothed Particle-Hydrodynamics, Finite-Volume methods) and describe the fundamentals of simulation-based optimisation.

- Skills: Student is able to identify an appropriate CFD-based solution strategy on a justified basis.

**Personal Competence**

- Social Competence: Student should practice her/his team-working abilities, learn to lead team sessions and present solutions to experts.

- Autonomy: Student should be able to structure and perform a simulation-based project independently.

### Workload in Hours
- Independent Study Time: 124, Study Time in Lecture: 56

### Credit points
6

### Examination
Project

### Examination duration and scale
- Project thesis (lecture accompanying, approx. 25 pages) with thesis defence (approx. 45 minutes)

### Assignment for the Following Curricula
- Energy Systems: Core qualification: Elective Compulsory
- Naval Architecture and Ocean Engineering: Core qualification: Elective Compulsory
- Ship and Offshore Technology: Core qualification: Elective Compulsory
- Theoretical Mechanical Engineering: Technical Complementary Course: Elective Compulsory
- Theoretical Mechanical Engineering: Specialisation Energy Systems: Elective Compulsory

<tr>
<td><strong>Educational Objectives</strong></td>
<td>After taking part successfully, students have reached the following learning results</td>
</tr>
</tbody>
</table>

**Professional Competence**
- **Knowledge**
  - Students can explain the project as well as their autonomously gained knowledge and relate it to current issues of their field of study.
  - They can explain the basic scientific methods they have worked with.
- **Skills**
  - The students are able to autonomously solve a limited scientific task under the guidance of an experienced researcher. They can justify and explain their approach for problem solving; they can draw conclusions from their results, and then can find new ways and methods for their work. Students are capable of comparing and assessing alternative approaches with their own with regard to given criteria.

**Personal Competence**
- **Social Competence**
  - The students are able to condense the relevance and the structure of the project work, the work procedure and the sub-problems for the presentation and discussion in front of a bigger group. They can lead the discussion and give a feedback on the project to their peers and supervisors.
- **Autonomy**
  - The students are capable of independently planning and documenting the work steps and procedures while considering the given deadlines. This includes the ability to accurately procure the newest scientific information. Furthermore, they can obtain feedback from experts with regard to the progress of the work, and to accomplish results on the state of the art in science and technology.

**Workload in Hours**
- Independent Study Time: 360
- Study Time in Lecture: 0

**Credit points** 12

**Examination**
- Project (accord. to Subject Specific Regulations)

**Examination duration and scale**
- depending on task

Module Responsible
Prof. Christopher Friedrich Wirz

Admission Requirements
None

Recommended Previous Knowledge
After taking part successfully, students have reached the following learning results

Professional Competence
Knowledge
The students are able to
- name the operating behaviour of consumers,
- describe special requirements on the design of supply networks and to the electrical equipment in isolated networks, as e.g. onboard ships, offshore units, factories and emergency power supply systems,
- explain power generation and distribution in isolated grids, wave generator systems on ships,
- name requirements for network protection, selectivity and operational monitoring,
- name the requirements regarding marine equipment and apply to product development, as well as
- describe operating procedures of equipment components of standard and specialized ships and derive requirements for product development.

Skills
Students are able to
- calculate short-circuit currents, switchgear,
- design electrical propulsion systems for ships
- design additional machinery components, as well as
- to apply basic principles of hydraulics and to develop hydraulic systems.

Personal Competence
Social Competence
The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

Autonomy
The widespread scope of gained knowledge enables the students to handle situations in their future profession independently and confidently.

### Professional Competence

- **Knowledge**: The most important design problems, constraints and methods related to the a.m. ship types are referenced, based on the list of methods developed in Ship Design I. The a.m. ship types serve as reference vessels where the application shall point out specific design aspects. The lecture closes with a brief introduction of design principles of dry bulk carriers, paper carriers and ouble ended ferries.

- **Skills**: Der Student soll die in Schiffsentwurf I erworbenen Kenntnisse und das zugehörige Methodenwissen konkrete an bestimmten Trockenfrachtern sowie an Passagierschiffen vertiefen. Am Ende der Vorlesung wird erwartet, dass der Student in der Lage ist, elementare Schiffsentwürfe durchzuführen zu können.

### Personal Competence

- **Social Competence**: The student learns to make technical decisions and to get acceptance for his decisions.

- **Autonomy**: Autonomous Elaboration of Design Information.

### Professional Competence

#### Knowledge
The students learn the motion equation and how to describe hydrodynamic forces. They will be able to develop methods for analysis of manoeuvring behaviour of ships and explaining the Nomoto equation. The students will know the common model tests as well as their assets and drawbacks. Furthermore, the students learn the basics of assessment and prognosis of ship manoeuvrability. Basics of characteristics of flows around ships in shallow water regarding ship propulsion and manoeuvrability will be acquired.

## Workload in Hours
- Independent Study Time: 62
- Study Time in Lecture: 28

## Lecture
Prof. Moustafa Abdel-Maksoud

## Language
DE/EN

## Cycle
WiSe

## Content
- coordinates & degrees of freedom
- governing equations of motion
- hydrodynamic forces & moments
- rudder forces
- navigation based on linearised eq.of motion (exemplary solutions, yaw stability)
- manoeuvring test (constraint & unconstraint motion)
- slender body approximation

## Learning Outcomes
Introduction into basic concepts for the assessment and prognosis ship manoeuvrability.

Module Responsible
Prof. Sören Ehlers

Admission Requirements
None

Recommended Previous Knowledge
none

Educational Objectives
After taking part successfully, students have reached the following learning results

Professional Competence

Knowledge
The challenges and requirements due to ice can be explained. Ice loads can be explained and ice strengthening can be understood.

Skills
The challenges and requirements due to ice can be assessed and the accuracy of these assessment can be evaluated. Calculation models to assess ice loads can be used and a structure can be designed accordingly.

Personal Competence

Social Competence
Students are capable to present their structural design and discuss their decisions constructively in a group.

Autonomy
Independent and individual assignment tasks can be carried out and presented whereby the capabilities to both, present and defend, the skills and findings will be achieved.

Workload in Hours
Independent Study Time: 110, Study Time in Lecture: 70

Content
1. Ice, Ice Properties, Ice Failure Modes and Challenges and Requirements due to Ice
   - Introduction, what is/means ice engineering
   - Description of different kinds of ice, main ice properties and different ice failure modes
   - Why is ice so different compared to open water
   - Presentation of design challenges and requirements for structures and systems in ice covered waters
2. Ice Load Determination and Ice Model Testing
   - Overview of different empirical equations for simple determination of ice loads
   - Discussion and interpretation of the different equations and results
   - Introduction to ice model tests
   - What are the requirements for ice model tests, what parameters have to be scaled
   - What can be simulated and how to use the results of such ice model tests
3. Computational Modelling of Ice-Structure Interaction Processes
   - Dynamic fracture and continuum mechanics for modelling ice-structure interaction processes
   - Discussion of contribution of ice properties, hydrodynamics and rubble.
4. Ice Design Philosophies and Perspectives
   - What has to be considered when designing structures or systems for ice covered waters
   - What are the main differences compared to open water design
   - Ice Management
   - What are the main ice design philosophies and why is an integrated concept so important for ice

Learning Objectives
The course will provide an introduction into ice engineering. Different kinds of ice and their different failure modes including numerical methods for ice load simulations are presented. Main design issues including design philosophies for structures and systems for ice covered waters are introduced. The course shall enable the attendees to understand the fundamental challenges due to ice covered waters and help them to understand ice engineering reports and presentations.

**Module Responsible**
Prof. Sören Ehlers

**Admission Requirements**
None

**Recommended Previous Knowledge**
Structural analysis of ships and/or offshore structures and fundamental knowledge in mechanics and mechanics of materials

**Educational Objectives**
After taking part successfully, students have reached the following learning results

**Professional Competence**
- Knowledge
  - Students are able to describe fatigue loads and stresses, as well as
  - describe structural behaviour under cyclic loads.

- Skills
  - Students are able to calculate life prediction based on the S-N approach as well as life prediction based on the crack propagation.

**Personal Competence**
- Social Competence
  - The students are able to communicate and cooperate in a professional environment in the shipbuilding and component supply industry.

- Autonomy
  - The widespread scope of gained knowledge enables the students to handle situations in their future profession independently and confidently.

**Workload in Hours**
Independent Study Time 124, Study Time in Lecture 56

**Credit points**
6

**Examination**
Oral exam

**Examination duration and scale**
30 min

Master thesis

Educational Aim

The aim of the individual master thesis is to develop the student’s project development skills and to combine many of the aspects learned during other modules within a specific topic and a coherent body of work. This will be achieved through students carrying out work into a particular topic relating to their theme and preparing a master thesis.

Learning Outcomes

On completion of the thesis, the student is expected to be able to

LO1 Plan and execute an individual project in an appropriate field of study.

LO2 Carry out an in-depth investigation of a leading edge topic.

LO3 Prepare, analyse and document project findings.

Syllabus

The individual master thesis is a major exercise undertaken throughout the period of study.

The student will investigate a relevant and agreed topic, adhering to a defined schedule, with the findings being documented in a master thesis.

The thesis may be undertaken in any institute with approval, or wholly in industry.

Based on the work of a project, a student will submit an individual master thesis which forms the main basis for assessment.

Assessment of Learning Outcomes

Criteria

LO1 Plan and execute an individual project in an appropriate field of study.

C1 Coverage, justification and analysis of field of study/topic and objectives.

C2 Rationale; Logical arguments (overall and within text); Flow; Completeness; Structure; Consistency; Correctness of assumptions, deductions; Methodology used etc.

LO2 Carry out an in-depth investigation of a leading edge topic.

C1 Critical analysis (problems and solutions); Objectivity.

C2 Evaluation; Demonstration of concepts; Case Study.

C3 Clarity, completeness and quality of findings and presentation.

LO3 Prepare, analyse and document project findings.

C1 Description of topic (depth and breadth), references to other work, logical development in the field.

C2 Clarity of writing; English; Grammar; Proper use of words; Presentation; Figures; Style; Quality.

C3 Description of outcomes, conclusions and recommendations.

C4 Evidence of contribution.

Module Responsible: Professoren der TUHH

Admission Requirements

According to General Regulations §24 (1):

At least 78 credit points have to be achieved in study programme. The examinations board decides on exceptions.

Recommended Previous Knowledge

Educational Objectives

After taking part successfully, students have reached the following learning results

Professional Competence Knowledge

- The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized issues.
- The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject, describing current developments and taking up a critical position on them.
- The students can place a research task in their subject area in its context and describe and critically assess the state of research.

[55]
### Skills

The students are able:

- To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question.
- To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incompletely defined problems in a solution-oriented way.
- To develop new scientific findings in their subject area and subject them to a critical assessment.

### Personal Competence

#### Social Competence

Students can:

- Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way.
- Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholding their own assessments and viewpoints convincingly.

### Autonomy

Students are able:

- To structure a project of their own in work packages and to work them off accordingly.
- To work their way in depth into a largely unknown subject and to access the information required for them to do so.
- To apply the techniques of scientific work comprehensively in research of their own.

### Workload in Hours

<table>
<thead>
<tr>
<th>Workload in Hours</th>
<th>Independent Study Time 900, Study Time in Lecture 0</th>
