Program description	3
Core Qualification	5
Module M0883: General and Inorganic Chemistry	5
Module M0850: Mathematics I	7
Module M1760: Introduction to Chemical and Bioengineering	9
Module M1761: Biological and Biochemical Fundamentals	10
Module M1802: Engineering Mechanics I (Stereostatics)	12
Module M0888: Organic Chemistry	14
Module M0671: Technical Thermodynamics I	16
Module M0851: Mathematics II	18
Module M1276: Fundamentals of Technical Drawing	20
Module M1803: Engineering Mechanics II (Elastostatics)	22
Module M0688: Technical Thermodynamics II	24
Module M0892: Chemical Reaction Engineering	26
Module M0853: Mathematics III	30
Module M1497: Measurement Technology for Chemical and Bioprocess Engineering	33
Module M1764: Bioprocess Technology I	35
Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication	37
Module M0544: Phase Equilibria Thermodynamics	39
Module M0536: Fundamentals of Fluid Mechanics	42
Module M0546: Thermal Separation Processes	45
Module M0538: Heat and Mass Transfer	50
Module M0833: Introduction to Control Systems	52
Module M1775: Economic and environmental project assessment	54
Module M0670: Particle Technology and Solids Process Engineering	56
Module M1969: Conceptual Process Design	58
Specialization Bio Engineering	60
Module M0877: Fundamentals in Molecular Biology	60
Module M1765: Bioprocess Technology II	62
Module M1766: Advanced Practical Course in Bioengineering	64
Module M1762: Material Engineering	65
Module M1498: Practice of Process Engineering	67
Module M1769: Regulatory aspects of biological agents	69
Module M1770: Bioinformatics	70
Module M0829: Foundations of Management	71
Specialization Chemical Engineering	74
Module M1715: Renewable Energies	74
Module M0729: Construction and Apparatus Engineering	77
Module M1762: Material Engineering	80
Module M1498: Practice of Process Engineering	82
Module M1768: Fundamentals of Chemical Kinetics	84
Module M0829: Foundations of Management	86

### **Program description**

### Content

Bio- and chemical engineers utilize the properties of raw materials and develop (bio)catalysts and processes to create new products or to realize more sustainable, energy-saving ways to existing products. In this way, important goals in climate and nature protection can be achieved by making processes more energy-efficient or using carbon dioxide as a substrate for new processes. New products can also include foodstuffs that make it possible to meet the needs of a growing world population while no longer exploiting the planet. Chemical and bioengineers are also helping to develop new medicines and design processes to produce them in large quantities. The basic human needs for clean drinking water, food, energy and health can only be met with the help of chemical engineering and biotechnology. Chemical and bioengineers biology, chemistry and physics for society by facilitating the production of food, chemicals, pharmaceuticals, fuels, building materials, metals and plastics on a large scale. Chemical and bioengineering thus bears a great responsibility for a resource-conserving and climate-friendly society. After all, a circular economy with a minimal ecological footprint can only be achieved through efficient material conversion processes with extensive recycling possibilities.

The course teaches the fundamentals of science (chemistry, biology, physics), mathematics, engineering (mechanics, measurement technology, construction) and process technology (thermodynamics, heat and mass transfer). The lecturers of process engineering assume that hybrid processes consisting of biological and chemical sub-processes will become more and more important in the future and therefore biological and chemical basics must be laid for future engineers in the field of process engineering. During the course of studies, students are given the opportunity to gain their first impressions of scientific research on (bio)process engineering systems and apparatus in the laboratory and pilot plant. In addition to the scientific and technical fundamentals, students learn a great deal about the various methods and equipment used to understand and calculate manufacturing processes and (bio)chemical reactions. After learning the basics, students can then choose a specialization topic in the fourth semester and specialize in chemical engineering or bioengineering.

The bioengineering specialization focuses on the areas of technical microbiology, biocatalysis and bioprocess engineering and teaches concepts and methods of biochemistry, genetics and micro-, molecular- and cell biology. The goal is to make understandable how biocatalysts and scalable biotechnological processes can be designed in order to design new sustainable biotechnological processes. The chemical engineering specialization enables students to recognize and formulate laws that can be used to plan, calculate, design, build and operate apparatus, machines and entire production plants for environmentally compatible processes.

Independent of the chosen specialization, the following master's degree programs can be chosen at the TUHH after a bachelor's degree in chemical and bioengineering can be chosen:

- → Process Engineering
- → Bioprocess Engineering
- → Chemical and Bioprocess Engineering

#### **Career prospects**

In principle, the following fields of activity are open to all graduates of process engineering courses:

Fields of activity in industry:

- Development and improvement of chemical, biotechnical or environmental processes
- Project planning, plant construction and operation of corresponding plants
- Elaboration of basic principles and development of new apparatus and processes
- Materials research and development
- Management in production plants
- Occupational safety and safety engineering
   Documentation and patent processing
- Marketing and sales

Fields of activity in the public sector:

- Research and teaching at scientific universities or institutes
- Technical administration and supervision
- Work in federal and state offices, e.g. patent office, trade supervisory office, materials testing office, Federal Environmental Agency

Freelance perspectives:

- Engineering offices
- Patent law firms
- Expert witnesses, industrial consultants
- Own company foundation

### Learning target

#### Learning objectives Knowledge

Graduates will be able to reproduce basic knowledge in the fields of mathematics, physics, biology, chemistry and mechanics.

- They will be able to explain the phenomena occurring in chemical and bioengineering and related disciplines.
- They will be able to explain the basic principles of chemical and bioengineering for the design, modeling and simulation of biological and process engineering processes and chemical reactions, of energy, mass and momentum transport processes, of separation processes on the micro, meso and macro scales, and for the operation of corresponding plants.
- They are able to describe the basic features of measurement, control and regulation technology.
- They are able to consider legal aspects in connection with (bio)process engineering processes and production plants.

Chemical engineering specialization:

- Graduates of the chemical engineering specialization are able to understand fundamental interrelationships in chemical processes and to implement these using additional knowledge of materials technology and plant and apparatus engineering, particularly with a focus on the use of renewable raw materials to realize production processes that are as sustainable as possible.
- Furthermore, graduates will be able to describe possible uses of renewable energies for the design of energy-efficient and climate-friendly production processes.

Bioengineering specialization:

- Graduates of the Bioengineering specialization are able to apply basic molecular biology techniques to specifically modify microorganisms for the production of chemicals and proteins.
- They will also be able to explain and apply the microbial, energetic, and process fundamentals of fermentative bioprocesses.

• They will be able to explain different kinetic approaches to growth and product formation of various microorganisms and apply them to bioprocess development and quantify transport processes in the bioreactor and use them to scale-up bioprocesses.

#### Learning objectives Skills

- Graduates will be able to apply their knowledge of mathematical and scientific principles and methods of engineering to simple problems and develop solutions.
- They can map typical, detailed problems from chemical and bioengineering (e.g. design of plants, calculation of heat and mass transfer processes) to their basic knowledge, find suitable solution methods and implement them. They are able to document the chosen solution method appropriately in writing.
- They can map practical, rather general problems from chemical and bioengineering (e.g. design of a process) to subproblems of their own subject or other relevant subjects, find suitable methods for solving the problem and implement them. They can present their solution to an audience in a clearly structured manner.
- They can work independently on given research problems using appropriate methods, document their chosen solution and present it to a knowledgeable audience.
- They are able to develop designs for (bio)process engineering processes according to specified requirements.
- They are able to independently plan and conduct experiments and interpret the results.

Chemical engineering specialization:

- Graduates of the chemical engineering specialization are able to understand, analyze and evaluate chemical mass transfer processes in technical gases and liquids from the molecular scale to the apparatus scale.
- They can develop designs for chemical processes according to specified requirements; select and apply appropriate analysis, modeling, and optimization methods; apply techniques and methods of chemical engineering; and assess their limitations.

Bioengineering major:

- Graduates of the Bioengineering specialization are able to penetrate, analyze and evaluate biological material conversion processes with biocatalysts (cells and enzymes) at the molecular and process level.
- They are able to develop designs for bioprocesses according to specified requirements; select and apply appropriate analysis, modeling, and optimization methods; apply bioprocess engineering techniques and methods and assess their limitations.

#### Learning objectives Social competence

- Graduates are qualified to cooperate with experts from other disciplines and to present the results of their work comprehensibly in written and oral form.
- They are able to communicate about contents and problems of chemical and bioengineering with experts and laymen in German and English.
- They can respond appropriately to inquiries, additions and comments. You can work independently both individually and in (international) groups.
- They can define, distribute and integrate subtasks. They can make time arrangements and interact socially.

#### Learning objectives Independence

- Graduates have the ability to responsibly apply their knowledge in different areas, taking into account safety, ecological and economic requirements, and to deepen their knowledge on their own responsibility.
- They have the ability to conduct literature research and to use databases and other sources of information for their work.
- They can realistically assess their existing competencies and work through deficits independently. They are able to assess the non-technical implications of engineering work.
- They are able to organize and carry out projects.

#### **Program structure**

The curriculum of the bachelor's program is structured as a Y-model. It has a common core qualification (150 LP) and the two specializations Chemical Engineering and Bioengineering (18 LP each), one of which has to be chosen in the fourth semester. The specializations consist of compulsory modules of 15 LP and an elective module of 3 LP. The final thesis comprises 12 LP, so that the total scope for the bachelor's degree program is 180 LP.

Workload in Hours	Independent Study Time 18, Study Time in Lecture 42
Lecturer	Prof. Gerrit A. Luinstra
Language	DE
Cycle	WiSe
	This laboratory course comprises the following four topics, i) atomic structure and application of spectroscopic methods, introduction of analytic methods ii) chemical reactions (qualitative analysis), bonding types, reaction types, reaction equations iii) acid-base concepts, acid-base reactions in water, buffer solution, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, galvanic elements and electrolysis. Prior to every experiement, a seminar takes place in small groups (12-15 students). The students participate orally. Team work and cooperation are forwarded because the experiments in the lab and the writing of the reports is conducted in groups of three or four students. Additionally, acedemic writing conveyed (documentation of experiment results in lab journals, literature citations in reports).

Content	The course pursues three important goals for the education of chemical and bioengineers. Using examples such as the production of penicillin or the Haber-Bosch process, the lecturers of process engineering present how green engineering processes can be developed with the help of process engineering approaches and methods and which development stages are passed through in the process. The lecturers also show how such processes can be made increasingly sustainable with the help of new research directions and results. In addition, students learn the basis of scientific literature research and how this can be used to open up a new subject area. They also learn how to distinguish between scientific and non-scientific sources. Finally, the students create their own short scientific texts and learn how to cite correctly and safely.

Courses				
Title		Тур	Hrs/wk	СР
Organic Chemistry (L0831)		Lecture	4	4
Organic Chemistry (L0832)		Practical Course	3	2
Module Responsible	Prof. Ralph Holl			
Admission Requirements	None			
<b>Recommended Previous</b>	High School Chemistry and/or lecture "general	and inorganic chemistry"		
Knowledge				
Educational Objectives	After taking part successfully, students have re	eached the following learning results		
Professional Competence				
	Students are familiar with basic concepts of organic chemistry. They are able to classify organic molecules and to identify functional groups and to describe the respective synthesis routes. Fundamental reaction mechanisms like nucleophilic substitution, eliminations, additions and aromatic substitution can be described. Students are capable to describe in general modern reaction mechanisms. Students are able to use basics of organic chemistry for the design of technical processes. Especially they are able to formulate basic routes to synthesize small organic molecules and by this to optimise technical processes in Process Engineering. They are able to transform a verbally formulated message into an abstract formal procedure. The students are able to document and interpret their working process and results scientifically.			
Personal Competence Social Competence	The students are able to discuss in small group	s and develop an approach for given tasks	5.	
Autonomy	Students are able to get new knowledge from	existing knowledge as well as to find ways	to use the knowledge	in practice.

СР	4
Workload in Hours	Independent Study Time 64, Study Time in Lecture 56
Lecturer	Prof. Nina Schützenmeister
Language	DE
Cycle	SoSe
Content	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkenes, aromatic
	compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further,
	fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and
	aromatic substitution. Also modern reaction mechanisms will be described.

Content	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkanes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

	ineering (Fundamentals) (L0221) Practical Course 2 2					
Module Responsible	Prof. Raimund Horn					
Admission Requirements	None					
<b>Recommended Previous</b>	Contents of the previous modules mathemat	ics I-III, physical chemistry, technical thermody	namics I+II as v	vell as computatio		
Knowledge	methods for engineers.					
Educational Objectives	After taking part successfully, students have r	eached the following learning results				
<b>Professional Competence</b>						
Knowledge	The students are able to explain basic concep	ots of chemical reaction engineering. They are	able to point out	differences betwe		
	thermodynamical and kinetical processes. Th	ne students have a strong ability to outline pa	rts of isotherma	I and non-isother		
	ideal reactors and to describe their properties.					
Skills	After successful completion of the module, stu	idents are able to:				
	- apply different computational methods to dimension isothermal and non-isothermal ideal reactors,					
	- apply unierent computational methods to uniersion isothermal and non-isothermal ideal reactors,					
	- determine and compute stable operation points for these reactors ,					
	- conduct experiments on a lab-scale pilot plants and document these according to scientific guidelines.					
Personal Competence						
Social Competence	After successful completition of the lab-cours	e the students have a strong ability to organiz	e themselfes in s	small groups to so		
			n discuss their subject related knowledge among each other and w			
	their teachers.					
Autonomy	The students are able to obtain further in	nformation and assess their relevance autor	nomously. Stude	nts can apply th		
	knowldege discretely to plan, prepare and cor		2	11.5

Course L0221: Experimental	Course Chemical Engineering (Fundamentals)			
Тур	Practical Course			
Hrs/wk	2			
СР	2			
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28			
Lecturer	Prof. Raimund Horn			
Language	DE/EN			
Cycle	SoSe			
Content	Performing and evaluation of experiments concerning chemical reaction engineering with emphasis on ideal reactors:			
	* Batch reactor - Estimation of kinetic parameters for the saponification of ethylacetate			
	*CSTR - Residence time distribution, reaction			
	CSTR in Series - Residence time distribution, reaction			
	* Plug Flow Reactor - Residence time distribution, reaction			
	Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice.			
	The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Content	In the Practical Course in Measurement Technology the theory from the lectures "Physical Fundamentals of Measurement Technology" and "Measurement Technology" will be applied in practice. In small groups students learn how to handle different measurement techniques from industry and research. During the practical course, a wide range of different measurement methods will be taught, including the use of HLPC columns for qualitative mass analysis, the determination of mass transfer coefficients using optical oxygen sensors or the evaluation of image data to obtain process parameters. The practical course also teaches how measurement data are statistically evaluated and experiments are correctly documented.

Content	Basic introduction to measurement technology for process engineers. Includes error calculation, measurement units, calibration, measurement data analysis, measurement techniques and sensors. Particular attention is paid to the measurement of temperature, pressure, flow and level. The lecture provides insights into the latest developments in sensor technology in measurement technology and process engineering.

Bioprocess Technology I (L2907)		Recitation Section (large)	2	1	
Bioprocess Technology I - Fundame	nental Practical Course (L2908) Practical Course 2 2				
Module Responsible	Prof. Andreas Liese				
Admission Requirements	None				
<b>Recommended Previous</b>					
Knowledge		cal Fundamentals"			
	Content of module "Organic Chemistry"				
Educational Objectives	After taking part successfully, students have reache	ed the following learning results			
Professional Competence					
Knowledge	Upon completion of the module, students will be ab	ble to:			
	<ul> <li>to describe basic processes of bioprocess en</li> </ul>	gineering,			
	<ul> <li>to assign different types of kinetics to enzym</li> </ul>	nes and microorganisms and to distinguish	inhibition types,		
	<ul> <li>to name and describe the parameters of stoi</li> </ul>				
	<ul> <li>to explain the mass transport processes in b</li> </ul>	-			
	• to understand and describe the basics of bioprocess management (batch and continuously operated reactor ty				
	calculation of the batch reaction time,) in great detail,				
	<ul> <li>to explain methods for the retention of enzymetric</li> </ul>	mes and microorganisms by immobilizatior	in bioreactors.		
Skills	Skills After successful completion of this module, students should be able to				
<ul> <li>using various kinetic approaches, to determine substrate turnover by enzymes as well as their kinetic parameters,</li> <li>describe the growth of whole cells with the help of different kinetic approaches as well as to determine their k parameters,</li> <li>qualitatively predict the effects of enzyme inhibition on the behavior of enzymes and on the overall process,</li> <li>analyze and determine bioprocesses based on the stoichiometry of the reaction system,</li> <li>differentiate the various basic reactor types in biotechnological processes and select them specifically for the resp application,</li> <li>set up and solve mass balance and differential equations for the mathematical description of fermentation processes,</li> <li>apply various methods for determining mass transfer parameters for gases in solution and calculate the corresponding transfer coefficients</li> </ul>				termine their kinetic cess, Ily for the respective tion processes,	
Personal Competence					
Social Competence	After completing the module, students are able to o	discuss scientific questions among themsel	ves and with inc	lustry representatives	
	in mixed teams, to represent their views on them a				
Autonomy		le to acquire new sources of knowledge an	d apply their kn	owledge to previously	
	unknown issues and to present these.

Content	In this course fermentation and downstream technologies on the example of the production of an enzyme by means of a recombinant microorganism is learned. Detailed characterization and simulation of enzyme kinetics as well as application of the enzyme in a bioreactor is carried out. The students document their experiments and results in a protocol.

Knowledge       - Starting from the very basics of thermodynamics, the students learn the mathematical tools to describe thermodynamics, the students learn thow phase equilibria.         Fire Jean Now state variables are influenced by the mixing of compounds and learn concepts to quantitatively describes properties.         Moreover, the students learn how phase equilibria can be described mathematically and which phenomena may occu different phase (upport liquid, solid) creats in equilibria. Furthemore the fundamentals of reaction equilibria are taught.         Solid       - Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria are taught.         Solid       - Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations meaningfully.         The students know models which can be used to determine the properties of the system in the equilibria state and know how to simplify these equations meaningfully.         The students know how to simplify these equations are capable of describing the properties of compounds as well model parameters in iteracture sources.         Social Compotence       - Ror specific applications, they are able to soft enders are able to understand fundamental concepts that are the basis for m separation and reaction processes in chemical engineering.         Automory       The students are able to work in small groups, to solve the corresponding problems and to present them oraly to the tutors, involvedge the students can adept their learning progress continuously in exercises. Based on thein knowledge, the students are able to check the	Educational Objectives	After taking part successfully, students have reach	ned the following learning results		
Starling from the very basics of thermodynamics, the students learn the mathematical tools to describe thermodyna equilibria.     They learn how state variables are influenced by the mixing of compounds and learn concepts to quantitatively describere properties.     Worever, the students is team how phase equilibria can be described mathematically and which phenomena may occur different phase equilibria, several examples relevant for different kinds of processes are shown and the necess knowledge for plotting and interpreting the equilibria are taught.     Sailis     Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations meaningfully.     The students knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations.     For specific applications, they are able to self-reliantly find necessary physico-chemical properties of compounds as well model parameters in liferature asources.     Beside pure compound properties the students are able to understand fundamental concepts that are the basis for m separation and reaction processes in chemical engineering.     Autonomy     He students are able to work in small groups, to solve the corresponding problems and to present them oraly to the tutors in knowledge the students are able to solve the interval and processes.     Based on their knowledge, the students are able to check their learning progress continuously in exercises. Based on knowledge the students are able to tock their learning progress continuously in exercises. Based on knowledge the students can adept their learning progress.     The students that and their learning progress.     The students that and their learning progress. Focus Renewable Energy: Elective Compulsory Green Technologies. Content	In the group exercise, the contents of the lecture are taken up and deepened by means of exercises. The exercise tasks correspond in quality and scope to the tasks of the written exam. Topics: Reynolds transport-theorem, pipe flow, free jet, angular momentum, Navier-Stokes equations, potential theory, mock exam, pipe hydraulics, pump design.

Content	In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards.

Course L1159: Separation Pr	ocesses
Тур	Practical Course
Hrs/wk	1
CP	1
Workload in Hours	Independent Study Time 16, Study Time in Lecture 14
Lecturer	Prof. Irina Smirnova
Language	DE/EN
Cycle	WiSe
Content	The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquiun
	takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and
	fellow students.
	The students work small groups with a high degree of division of labor. For every experiment, the students write a report. The
	receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they ca
	increase their capabilities in this area.
	Topics of the practical course:
	<ul> <li>Introduction in the thermal process engineering and to the main features of separation processes</li> </ul>
	Simple equilibrium processes, several steps processes
	Distillation of binary mixtures, enthalpy-concentration diagrams
	Extractive and azeotrope distillation, water vapor distillation, stepwise distillation
	Extraction: separation ternary systems, ternary diagram
	Multiphase separation including complex mixtures
	Designing of separation devices without discrete stages
	• Drying
	Chromatographic separation processes
	Membrane separation
	Energy demand of separation processes
	Advance overview of separation processes
	Selection of separation processes

•	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	
	<ul> <li>The students are capable of explaining qualitative and determining quantitative heat transfer in procedural apparatus (e.</li> </ul>
	heat exchanger, chemical reactors).
	They are capable of distinguish and characterize different kinds of heat transfer mechanisms namely heat conduction, he
	transfer and thermal radiation.
	<ul> <li>The students have the ability to explain the physical basis for mass transfer in detail and to describe mass trans</li> </ul>
	qualitative and quantitative by using suitable mass transfer theories.
	They are able to depict the analogy between heat- and mass transfer and to describe complex linked processes in detail.
Skills	• The students are able to get reasonable system have device for a since two-set with the students the
	<ul> <li>The students are able to set reasonable system boundaries for a given transport problem by using the gained knowled</li> </ul>
	and to balance the corresponding energy and mass flow, respectively.
	They are capable to solve specific heat transfer problems (e.g. heated chemical reactors, temperature alteration in flui
	and to calculate the corresponding heat flows.
	<ul> <li>Using dimensionless quantities, the students can execute scaling up of technical processes or apparatus.</li> </ul>
	They are able to distinguish between diffusion, convective mass transition and mass transfer. They can use this knowled
	for the description and design of apparatus (e.g. extraction column, rectification column).
	In this context, the students are capable to choose and design fundamental types of heat and mass exchanger for a speci
	application considering their advantages and disadvantages, respectively.
	<ul> <li>In addition, they can calculate both, steady-state and non-steady-state processes in procedural apparatus.</li> </ul>
	<ul> <li>The students are capable to connect their knowledge obtained in this course with knowledge of other courses</li> </ul>
	particular the courses thermodynamics, fluid mechanics and chemical process engineering) to solve concrete technic
	problems.
Personal Competence	
Social Competence	
	<ul> <li>The students are capable to work on subject-specific challenges in teams and to present the results orally in a reasonal</li> </ul>
	manner to tutors and other students.
Autonomy	
Autonomy	<ul> <li>The students are able to find and evaluate necessary information from suitable sources</li> </ul>
	They are able to prove their level of knowledge during the course with accompanying procedure continuously (click
	system, exam-like assignments) and on this basis they can control their learning processes.

Module M1775: Econo	mic and environmental projec	t assessment			
Courses					
Title Case studies economic and environ Basics of Environmental Project Ass Basics of economic project assemer	essment (L0860)	<b>Typ</b> Recitation Section (small) Lecture Lecture	<b>Hrs/wk</b> 1 2 2	<b>CP</b> 1 2 3	
	Prof. Martin Kaltschmitt				
Admission Requirements					
Recommended Previous Knowledge	none				
Educational Objectives	After taking part successfully, students have	reached the following learning results			
	On completion of this module, students will be able to analyze and evaluate projects / project ideas from an economic and environmental point of view; i.e. they will be able to systematize / analyze an intended / planned project on the basis of certain criteria and then, with the help of economic and environmental instruments, evaluate such planned projects on the basis of the specific provision costs and selected environmental parameters. Such an approach includes a basic knowledge in the field of economic calculations (e.g. static and dynamic methods) on the one hand and a basic understanding in relation to the preparation of a life cycle assessment / an eco balance on the other hand. In addition, there is the knowledge to implement these instruments for corresponding specific use cases through balance boundaries to be drawn independently by the students and to interpret the results accordingly. The students are able to apply the methods for an economic evaluation (e.g. annuity method) and for an environmental evaluation (e.g. life cycle assessment / eco balance) to different types of projects - and this related to various frame conditions. They will then be able to evaluate corresponding projects (including energy projects, chemical projects) in economic and environmental terms - and on the basis of this - in a systemic manner, and to make statements about the corresponding economic and environmental limitations. Additionally, students are able to orally explain issues from the subject area, approaches to dealing with them, and place them in their respective context.				
Personal Competence					
	Students are able to investigate suitable technical projects and ultimately evaluate them based on economic and environmenta evaluation criteria - and thus finally under a wide range of sustainability aspects. Students will be able to independently access various sources about the field, acquire knowledge, and transform it to address new issues.

Cycle	WiSe			
Content	In groups, the students plan a production plant for a microbial process (up-stream) using the "Bioprocess Trainer" software from Hass & Pörtner "Praxis der Bioprozesstechnik". The design of the production plant should combine two major topics: plant technology (bioreactors, type, power input, gassing, stirrer, scale-up, etc.) and processes strategy (process modes, feeding strategies, etc.). The results are presented in presentations on the current status of the work and a final presentation and summarized in a written elaboration.

Content	This lecture deals with the legal framework of biotechnological and chemical work. On the basis of the acts and ordinacesto be considered (e.g. Occupational Health and Safety Act, Biological Substances Ordinance, Genetic Engineering Act, etc.), the legal frameworks are explained. In addition, requirements for safety classifications of genetic engineering work and the equipment of laboratories for genetic engineering work genetic are presented. Furthermore, national and international requirements for drug production with industrial reference are discussed.
Literature	Die zum Zeitpunkt der Vorlesung gültigen Gesetze werden in der Vorlesung dargestellt und bekanntgegeben.

Module Responsible	Prof. Johannes Gescher
Admission Requirements	None
<b>Recommended Previous</b>	Students should be familiar with the basics of molecular biology and genetics, and have knowledge of microbial cultivation.
Knowledge	In addition, prior knowledge of DNA sequencing technologies and the phylogenetic tree of life is advantageous. Also helpful is se experience with command line based computer input.
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
	During the course, students gain knowledge of different application areas of DNA sequencing technologies, the potentia previously uncharacterized microbial metabolic pathways, how life forms differ in the metabolism of microbes, and the benefit the growth of microbial communities. By the end of the seminar, participants will be familiar with the basics of command line usage and the difficulties of dealing we large data sets. Specifically, applications for analyzing sequencing data will be practiced, as well as interpretation characterizing microbial systems.
	Topics covered in the course:
	- Genome sequencing on a MinION
	- De novo genome assembly
	- Metagenome analyses
	- Functional and taxonomic annotation of gene sequences
	- Construction of phylogenetic trees
	- Representation of metabolic pathways
	- Genome mining
	- Protein structure analyses
Personal Competence	
Social Competence	Tasks are worked on in groups. Whereby a clear presentation of the used parameters, methods and intermediate results must chosen for communication in the group.
Autonomy	Students will be able to summarize their findings from the completed subtasks in a report.

Language	DE
Cycle	WiSe/SoSe
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busi knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Language	DE
Cycle	SoSe
Content	This module includes a presentation of the renewable energy supply and a discussion of the respective technologies for providing the desired final or useful energy. Specifically, this includes the options for solar energy use for heat and power generation (i.e., passive solar energy use, solar collectors for low-temperature heat provision, solar thermal power generation, photovoltaic power generation), wind energy use for power generation (i.e. onshore and offshore wind power use), hydroelectric power use for electricity generation (i.e., run-of-river and storage hydroelectric power), ocean energy use for electricity generation (including tidal power plants), and geothermal energy use for heat and electricity generation (i.e., near-surface use by means of heat pumps, deep geothermal energy use for heat and/or electricity generation).

Cycle	SoSe
Content	This lecture covers all options for energy supply from biomass; this includes the supply of heat, electricity and fuels. The biomass resource and its origin will be discussed first. Afterwards the biomass supply is addressed, which bridges the gap between biomass generation and utilization. Subsequently, the different conversion options are discussed. Only those options are presented in depth that have a corresponding significance on the market in Germany and Europe. This includes (a) heat generation from biogenic solid fuels in small and large-scale plants (b) power generation from solid biomass via combustion (c) a biogas production from residues, by-products and waste, (d) alcohol production from sugar and starch (e) biodiesel production from vegetable oils. Special attention is also paid to the corresponding environmental aspects. An economic classification of the various options is also provided.

Module M1762: Mate	rial Engineering				
module mir/02: mate					
Courses					
Title		Тур	Hrs/wk	СР	
Material Engineering (L2894)		Lecture	2	3	
Module Responsible	Dr. Marko Hoffmann				
Admission Requirements	None				
<b>Recommended Previous</b>	Constal and Inorganic Chemistry				
Knowledge	<ul><li>General and Inorganic Chemistry</li><li>Phase Equilibria Thermodynamics</li></ul>				
	• Phase Equilibria mermodynamics				
Educational Objectives	After taking part successfully, students have r	eached the following learning results			
Professional Competence					
Knowledge	A basic knowledge of materials science is nece	essary for the design of process plants a	nd apparatus with the a	ssociated piping. T	
	module therefore focuses on ferrous materials, although polymer materials and ceramics are also covered. A basic understandin				
	of atomic structure, microstructure, phase tra	ansformation, diffusion, state diagrams,	and alloy formation, an	nong other things	
	necessary for materials selection and for the	evaluation of corrosion and wear proce	esses, which students s	hould acquire in t	
	one-semester module. Students will also have	e basic knowledge in the area of mech	nanical properties of ma	aterials including	
	essential methods of materials testing and the	ne corrosion processes that are very rel	evant in practice. In ad	dition, students g	
	knowledge of the main types of steel used in process engineering and knowledge of the most important heat treatment processe				
	of steels in practice in the context of time-tem	perature transformation diagrams (TTT o	diagrams).		
Skills	Students will be able to select suitable mate	rials for the design of process plants ar	nd apparatus Mechanic	al properties such	
U.M.B	s Students will be able to select suitable materials for the design of process plants and apparatus. Mechanical properties such as strength, ductility, toughness and fatigue strength are taken into account. Students can also specify measures to increase				
	corrosion resistance. In addition to specifying strength-increasing measures, students may select other measures to modif				
	mechanical properties, such as heat treatmen				
Personal Competence					
Social Competence	The students are able to work out results in	groups and document them, provide ap	propriate feedback and	handle feedback	
	their own performance constructively.				
Autonomy	Students are able to independently assess the	heir level of learning and reflect on the	eir weaknesses and stre	enaths in the field	
	materials engineering. Students are also able to independently seek out information from subject-specific publications and relat				
	this to the context of the course, e.g. when se

Knowledge				
Educational Objectives	After taking part successfully, students have r	eached the following learning results		
Professional Competence				
Knowledge	After passing this module the students have the	ne ability to:		
	<ul> <li>give an overview of a certain important</li> </ul>	field on process and bioprocess angines	ring	
	<ul> <li>explain some working methods for diffe</li> </ul>		ning,	
	• explain some working methods for unre	rene neids in process engineering.		
Skills	After successfully completing this module, stu	dents are able to		
	<ul> <li>prepare a written summary of a process</li> </ul>	engineering tonic		
	<ul> <li>to briefly present and discuss a topic in</li> </ul>			
	<ul> <li>to roughly describe independently typic</li> </ul>	•	ical processes by means	s of notes
	- to rouginy describe independently typic	al process engineering and biotechnolog	ical processes by means	of notes.
Personal Competence				
Social Competence	The students are able to			
	<ul> <li>work out results in groups and documer</li> </ul>	nt them.		
	<ul> <li>provide appropriate feedback and hand</li> </ul>		nstructivelv.	
	h h h . h			
Autonomy	The students are able to estimate their progr	ress of learning by themselves and to de	eliberate their lack of k	nowledge in Process
	Engineering and Bioprocess Engineering.

СР	3				
Workload	Independent Study Time 62, Study Time in Lecture 28				
in Hours					
Lecturer	Prof. Christian Lüthje, Katharina Roedelius				
Language	DE				
Cycle	WiSe/SoSe				
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.				
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busi knowledge from the lecture should come to practical use. The group projects are guided by a mentor.
