Bachelor of Science (B.Sc.)

### Chemical and Bioprocess Engineering

Cohort: Winter Term 2022 Updated: 9th May 2025

### **Table of Contents**

Table of Contents	2
Program description	3
Core Qualification	5
Module M0883: General and Inorganic Chemistry	5
Module M0850: Mathematics I	
Module M0577: Non-technical Courses for Bachelors	9
Module M1760: Introduction to Chemical and Bioengineering	11
Module M1761: Biological and Biochemical Fundamentals	12
Module M1802: Engineering Mechanics I (Stereostatics)	14
Module M0671: Technical Thermodynamics I	16
Module M0888: Organic Chemistry	18
Module M0851: Mathematics II	20
Module M1276: Fundamentals of Technical Drawing	22
Module M1803: Engineering Mechanics II (Elastostatics)	24
Module M0688: Technical Thermodynamics II	26
Module M0892: Chemical Reaction Engineering	28
Module M0853: Mathematics III	32
Module M1497: Measurement Technology for Chemical and Bioprocess Engineering	35
Module M1764: Bioprocess Technology I	37
Module M0544: Phase Equilibria Thermodynamics	39
Module M0536: Fundamentals of Fluid Mechanics	42
Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication	45
Module M0546: Thermal Separation Processes	47
Module M0538: Heat and Mass Transfer	52
Module M0833: Introduction to Control Systems	54
Module M1775: Economic and environmental project assessment	56
Module M0670: Particle Technology and Solids Process Engineering	58
Module M1969: Conceptual Process Design	60
Specialization Bio Engineering	62
Module M0877: Fundamentals in Molecular Biology	62
Module M1765: Bioprocess Technology II	64
Module M1766: Advanced Practical Course in Bioengineering	66
Module M1762: Material Engineering	67
Module M1498: Practice of Process Engineering	69
Module M1769: Regulatory aspects of biological agents	71
Module M1770: Bioinformatics	72
Module M0829: Foundations of Management	73
Specialization Chemical Engineering	76
Module M1715: Renewable Energies	76
Module M0729: Construction and Apparatus Engineering	79
Module M1762: Material Engineering	82
Module M1498: Practice of Process Engineering	84
Module M1768: Fundamentals of Chemical Kinetics	86
Module M0829: Foundations of Management	88
Thesis	91
Module M-001: Bachelor Thesis	91

### **Program description**

### Content

Bio- and chemical engineers utilize the properties of raw materials and develop (bio)catalysts and processes to create new products or to realize more sustainable, energy-saving ways to existing products. In this way, important goals in climate and nature protection can be achieved by making processes more energy-efficient or using carbon dioxide as a substrate for new processes. New products can also include foodstuffs that make it possible to meet the needs of a growing world population while no longer exploiting the planet. Chemical and bioengineers are also helping to develop new medicines and design processes to produce them in large quantities. The basic human needs for clean drinking water, food, energy and health can only be met with the help of chemical engineering and biotechnology. Chemical and bioengineers biology, chemistry and physics for society by facilitating the production of food, chemicals, pharmaceuticals, fuels, building materials, metals and plastics on a large scale. Chemical and bioengineering thus bears a great responsibility for a resource-conserving and climate-friendly society. After all, a circular economy with a minimal ecological footprint can only be achieved through efficient material conversion processes with extensive recycling possibilities.

The course teaches the fundamentals of science (chemistry, biology, physics), mathematics, engineering (mechanics, measurement technology, construction) and process technology (thermodynamics, heat and mass transfer). The lecturers of process engineering assume that hybrid processes consisting of biological and chemical sub-processes will become more and more important in the future and therefore biological and chemical basics must be laid for future engineers in the field of process engineering. During the course of studies, students are given the opportunity to gain their first impressions of scientific research on (bio)process engineering systems and apparatus in the laboratory and pilot plant. In addition to the scientific and technical fundamentals, students learn a great deal about the various methods and equipment used to understand and calculate manufacturing processes and (bio)chemical reactions. After learning the basics, students can then choose a specialization topic in the fourth semester and specialize in chemical engineering or bioengineering.

The bioengineering specialization focuses on the areas of technical microbiology, biocatalysis and bioprocess engineering and teaches concepts and methods of biochemistry, genetics and micro-, molecular- and cell biology. The goal is to make understandable how biocatalysts and scalable biotechnological processes can be designed in order to design new sustainable biotechnological processes. The chemical engineering specialization enables students to recognize and formulate laws that can be used to plan, calculate, design, build and operate apparatus, machines and entire production plants for environmentally compatible processes.

Independent of the chosen specialization, the following master's degree programs can be chosen at the TUHH after a bachelor's degree in chemical and bioengineering can be chosen:

- → Process Engineering
- → Bioprocess Engineering
- → Chemical and Bioprocess Engineering

#### **Career prospects**

In principle, the following fields of activity are open to all graduates of process engineering courses:

Fields of activity in industry:

- Development and improvement of chemical, biotechnical or environmental processes
- Project planning, plant construction and operation of corresponding plants
- Elaboration of basic principles and development of new apparatus and processes
- Materials research and development
- Management in production plants
- Occupational safety and safety engineering
   Documentation and patent processing
- Marketing and sales

Fields of activity in the public sector:

- Research and teaching at scientific universities or institutes
- Technical administration and supervision
- Work in federal and state offices, e.g. patent office, trade supervisory office, materials testing office, Federal Environmental Agency

Freelance perspectives:

- Engineering offices
- Patent law firms
- Expert witnesses, industrial consultants
- Own company foundation

### Learning target

#### Learning objectives Knowledge

Graduates will be able to reproduce basic knowledge in the fields of mathematics, physics, biology, chemistry and mechanics.

- They will be able to explain the phenomena occurring in chemical and bioengineering and related disciplines.
- They will be able to explain the basic principles of chemical and bioengineering for the design, modeling and simulation of biological and process engineering processes and chemical reactions, of energy, mass and momentum transport processes, of separation processes on the micro, meso and macro scales, and for the operation of corresponding plants.
- They are able to describe the basic features of measurement, control and regulation technology.
- They are able to consider legal aspects in connection with (bio)process engineering processes and production plants.

Chemical engineering specialization:

- Graduates of the chemical engineering specialization are able to understand fundamental interrelationships in chemical processes and to implement these using additional knowledge of materials technology and plant and apparatus engineering, particularly with a focus on the use of renewable raw materials to realize production processes that are as sustainable as possible.
- Furthermore, graduates will be able to describe possible uses of renewable energies for the design of energy-efficient and climate-friendly production processes.

Bioengineering specialization:

- Graduates of the Bioengineering specialization are able to apply basic molecular biology techniques to specifically modify microorganisms for the production of chemicals and proteins.
- They will also be able to explain and apply the microbial, energetic, and process fundamentals of fermentative bioprocesses.

• They will be able to explain different kinetic approaches to growth and product formation of various microorganisms and apply them to bioprocess development and quantify transport processes in the bioreactor and use them to scale-up bioprocesses.

#### Learning objectives Skills

- Graduates will be able to apply their knowledge of mathematical and scientific principles and methods of engineering to simple problems and develop solutions.
- They can map typical, detailed problems from chemical and bioengineering (e.g. design of plants, calculation of heat and mass transfer processes) to their basic knowledge, find suitable solution methods and implement them. They are able to document the chosen solution method appropriately in writing.
- They can map practical, rather general problems from chemical and bioengineering (e.g. design of a process) to subproblems of their own subject or other relevant subjects, find suitable methods for solving the problem and implement them. They can present their solution to an audience in a clearly structured manner.
- They can work independently on given research problems using appropriate methods, document their chosen solution and present it to a knowledgeable audience.
- They are able to develop designs for (bio)process engineering processes according to specified requirements.
- They are able to independently plan and conduct experiments and interpret the results.

Chemical engineering specialization:

- Graduates of the chemical engineering specialization are able to understand, analyze and evaluate chemical mass transfer processes in technical gases and liquids from the molecular scale to the apparatus scale.
- They can develop designs for chemical processes according to specified requirements; select and apply appropriate analysis, modeling, and optimization methods; apply techniques and methods of chemical engineering; and assess their limitations.

Bioengineering major:

- Graduates of the Bioengineering specialization are able to penetrate, analyze and evaluate biological material conversion processes with biocatalysts (cells and enzymes) at the molecular and process level.
- They are able to develop designs for bioprocesses according to specified requirements; select and apply appropriate analysis, modeling, and optimization methods; apply bioprocess engineering techniques and methods and assess their limitations.

#### Learning objectives Social competence

- Graduates are qualified to cooperate with experts from other disciplines and to present the results of their work comprehensibly in written and oral form.
- They are able to communicate about contents and problems of chemical and bioengineering with experts and laymen in German and English.
- They can respond appropriately to inquiries, additions and comments. You can work independently both individually and in (international) groups.
- They can define, distribute and integrate subtasks. They can make time arrangements and interact socially.

#### Learning objectives Independence

- Graduates have the ability to responsibly apply their knowledge in different areas, taking into account safety, ecological and economic requirements, and to deepen their knowledge on their own responsibility.
- They have the ability to conduct literature research and to use databases and other sources of information for their work.
- They can realistically assess their existing competencies and work through deficits independently. They are able to assess the non-technical implications of engineering work.
- They are able to organize and carry out projects.

#### **Program structure**

The curriculum of the bachelor's program is structured as a Y-model. It has a common core qualification (150 LP) and the two specializations Chemical Engineering and Bioengineering (18 LP each), one of which has to be chosen in the fourth semester. The specializations consist of compulsory modules of 15 LP and an elective module of 3 LP. The final thesis comprises 12 LP, so that the total scope for the bachelor's degree program is 180 LP.

Cycle	WiSe
	This laboratory course comprises the following four topics, i) atomic structure and application of spectroscopic methods, introduction of analytic methods ii) chemical reactions (qualitative analysis), bonding types, reaction types, reaction equations iii) acid-base concepts, acid-base reactions in water, buffer solution, quantitative analysis (titration) iv), redox processes in water, redox potential, Nernst theory describing the concentration dependence of redox potentials, galvanic elements and electrolysis. Prior to every experiement, a seminar takes place in small groups (12-15 students). The students participate orally. Team work and cooperation are forwarded because the experiments in the lab and the writing of the reports is conducted in groups of three or four students. Additionally, acedemic writing conveyed (documentation of experiment results in lab journals, literature citations in reports).

Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	The Non-technical Academic Programms (NTA)	
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover full Self-reliance, self-management, collaboration and professional and personnel management competences. The departmer implements these training objectives in its <b>teaching architecture</b> , in its <b>teaching and learning arrangements</b> , in <b>teachin</b> <b>areas</b> and by means of teaching offerings in which students can qualify by opting for <b>specific competences</b> and a <b>competence</b> <b>level</b> at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnic complementary courses.	
	The Learning Architecture	
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnic academic programms follow the specific profiling of TUHH degree courses.	
	The learning architecture demands and trains independent educational planning as regards the individual development competences. It also provides orientation knowledge in the form of "profiles"	
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation study these subjects in one or two specific semesters during the course of studies.	
	Teaching and Learning Arrangements	
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of deali with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberate encouraged in specific courses	
	encouraged in specific courses.	
	Fields of Teaching	
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migratic studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semest 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a gos oriented way.	
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goa oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.	
	The Competence Level	
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. The differences are reflected in the practical examples used, in content topics that refer to different professional application context and in the higher scientific and theoretical level of abstraction in the B.Sc.	
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadersh functions of Bachelor's and Master's graduates in their future working life.	
	Specialized Competence (Knowledge)	
	Students can	
	<ul> <li>locate selected specialized areas with the relevant non-technical mother discipline,</li> <li>outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,</li> <li>different specialist disciplines relate to their own discipline and differentiate it as well as make connections,</li> <li>sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,</li> <li>Can communicate in a foreign language in a manner appropriate to the subject</li> </ul>	
Cl-ille	Can communicate in a foreign language in a manner appropriate to the subject.  Professional Competence (Skills)	
5K1115	Professional Competence (Skills)	
	<ul> <li>In selected sub-areas students can</li> <li>apply basic methods of the said scientific disciplines,</li> <li>auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned special discipline,</li> <li>to handle simple questions in aforementioned scientific disciplines in a sucsessful manner,</li> <li>justify their decisions on forms of organization and application in practical questions in contexts that go beyond t technical relationship to the subject.</li> </ul>	
Personal Competence		
Social Competence	Personal Competences (Social Skills)	
	Students will be able	
1		

### Module Manual B.Sc. "Chemical and Bioprocess Engineering" • to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, • to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), • to explain nontechnical items to auditorium with technical background knowledge. Autonomy Personal Competences (Self-reliance) Students are able in selected areas • to reflect on their own profession and professionalism in the context of real-life fields of application • to organize themselves and their own learning processes • to reflect and decide questions in front of a broad education background • to communicate a nontechnical item in a competent way in writen form or verbaly • to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen) Workload in Hours Depends on choice of courses Credit points 6

Content	The course pursues three important goals for the education of chemical and bioengineers. Using examples such as the production of penicillin or the Haber-Bosch process, the lecturers of process engineering present how green engineering processes can be developed with the help of process engineering approaches and methods and which development stages are passed through in the process. The lecturers also show how such processes can be made increasingly sustainable with the help of new research directions and results. In addition, students learn the basis of scientific literature research and how this can be used to open up a new subject area. They also learn how to distinguish between scientific and non-scientific sources. Finally, the students create their own short scientific texts and learn how to cite correctly and safely.
Literature	Literatur und zusätzliche Informationsquellen werden während der Veranstaltung über StudIP zur Verfügung gestellt.

Skills	The students master the basic techniques of s maintain microorganisms in culture. In addit environmental samples.			
Personal Competence				
Social Competence	The students are able,			
	- to gather knowledge in groups of about 2 to 1	.0 students		
	- to introduce their own knowledge and to argu	e their view in discussions in teams		
	- to divide a complex task into subtasks, solve	these and to present the combined results		
Autonomy	Students are able to independently structure their internship days and prioritize tasks. Furthermore, they are able to collect an process basic information on microorganisms via a literature search.

Тур	Lecture
Hrs/wk	2
CP	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Johannes Gescher
Language	DE
Cycle	WiSe
	In the lecture we will learn the basic characteristics of organisms of all kingdoms of life. This includes cell biology as well as cell physiology. We understand the energetic foundations of living systems and the variety of possible metabolic concepts of life. From these basic laws we will understand how and to what extent an application and genetic reprogramming of organisms for application can take place.
	Fuchs: Allgemeine Mikrobiologie, 11. vollständig überarbeitete Auflage 2022; ISBN: 9783132434776 Brock: Biology of Microorganisms, ISBN-13: 9780134626109

Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Prof. Johannes Gescher
Language	DE
Cycle	SoSe
	The aim of the practical course is to teach basic microbiological and molecular biological techniques on the basis of individual research assignments and control experiments. In doing so, organisms are to be isolated in this practical course, which will be further processed by students of the 4th and 6th semester in two independent modules.
Literature	Steinbüchel: Mikrobiologisches Praktikum, ISBN: 978-3-662-63234-5

Courses								
Title					Тур	Hrs	/wk	СР
Organic Chemistry (L0831)					Lecture	4		4
Organic Chemistry (L0832)					Practical Course	3		2
Module Responsible	Prof. Ralph Holl							
Admission Requirements	None							
<b>Recommended Previous</b>	High School Chemistry	and/or lecture '	"general	and inorgani	c chemistry"			
Knowledge								
Educational Objectives	After taking part succe	essfully, students	s have re	eached the fo	llowing learning results			
Professional Competence								
Knowledge	Students are familiar with basic concepts of organic chemistry. They are able to classify organic molecules and to identify functional groups and to describe the respective synthesis routes. Fundamental reaction mechanisms like nucleophilic substitution, eliminations, additions and aromatic substitution can be described. Students are capable to describe in general modern reaction mechanisms.							
Skills	Students are able to use basics of organic chemistry for the design of technical processes. Especially they are able to formulate basic routes to synthesize small organic molecules and by this to optimise technical processes in Process Engineering. They are able to transform a verbally formulated message into an abstract formal procedure. The students are able to document and interpret their working process and results scientifically.							
Personal Competence								
Social Competence	The students are able	to discuss in sm	all group	ps and develo	p an approach for given t	asks.		
Autonomy	Students are able to g	Students are able to get new knowledge from existing knowledge as well as to find ways to use the knowledge in practice.

Content	The lecture covers basic concepts of organic chemistry. This includes simple carbon compounds, alkanes, alkanes, aromatic compounds, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amines, amides and amino acids. Further, fundamentals of reaction mechanisms will be described. This includes nucleophilic substitution, eliminations, additions and aromatic substitution. Also modern reaction mechanisms will be described. Prior to each experiment, an oral colloquium takes place in small groups. In the colloquium are security aspects of the experiments are discussed, as well as the topics of the experiments. Solutions to previously provided questions are answered. In the colloquia the students acquire the skill to express scientific matters orally in a scientifically correct language and to describe theoretical basics. The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Knowledge	methods for engineers.			
Educational Objectives	After taking part successfully, students have rea	ached the following learning results		
Professional Competence				
Knowledge	The students are able to explain basic concepts	s of chemical reaction engineering. They are a	able to point out	differences betwe
	thermodynamical and kinetical processes. The	students have a strong ability to outline pa	rts of isotherma	I and non-isotherr
	ideal reactors and to describe their properties.			
Skills	After successful completion of the module, stud	ents are able to:		
	- apply different computational methods to dime	ension isothermal and non-isothermal ideal rea	actors,	
	- determine and compute stable operation point	ts for these reactors ,		
	- conduct experiments on a lab-scale pilot plant	s and document these according to scientific g	juidelines.	
Personal Competence				
Social Competence	After successful completition of the lab-course	the students have a strong ability to organize	e themselfes in s	small groups to so
	issues in chemical reaction engineering. The s	students can discuss their subject related know	owledge among	each other and w
	their teachers.			
Autonomy	The students are able to obtain further info	ormation and assess their relevance autor	omously. Stude	nts can apply th
	knowldege discretely to plan, prepare and cond	uct experiments.

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28	
Lecturer	Prof. Raimund Horn	
Language	DE	
Cycle	WiSe	
Content	Fundamentals of chemical reaction engineering, definitions, calculation of species concentrations (reactor, reaction mixture, reactants, products, inerts and solvents, reaction volume, Reaktor volume, chemical reaction, mass, moles, mole fraction, volume, density, molar concentration, mass-concentration, molality, partial pressure, hydrodynamic residence time, space time, extent of reaction, reactor throughput, reactor load, conversion, selectivity, yield, concentration calculations in stationary and flowing multicomponent-mixtures) Stoichiometry and stoichiometric calculations (simple reactions, complex reactions, key reactions, key species, matrix of stoichiometric coefficients, linear dependent and independent reactions, element-species-matrix, row reduced form of a matrix, rank of a matrix, Gauss Jordan elimination, relation between stoichiometry and kinetics, calculating the extent of reaction from mole number changes in complex reactions)	
	Thermodynamics (What is thermodynamics?, importance of thermodynamics in chemical reaction engineering, zeroth law of thermodynamics, temperature scales, temperature measurements in praxis, first law of thermodynamics, internal energy, enthalpy, calorimeter, heat of reaction, standard heat of formation, Hess law, heat capacity, Kirchhoff law, standard heat of reaction, pressure dependence of the heat of reaction, second law of thermodynamics, reversible and irreversible processes, entropy, Clausius inequality, free energy, Gibbs Energy, chemical potential, chemical equilibrium, activity, van't Hoff law, calculation of chemical equilibrium, principle of Le Chatelier and Braun, equilibrium calculations in multiple reaction systems, Lagrange Multipliers) Chemical kinetics (reversible and irreversible reactions, homogeneous and heterogeneous reactions, elementary step, reaction mechanism, microkinetics, macrokinetics, formal kinetics, reaction rate, rate of change of species mole number, Arrhenius-equation, activation energy and pre-exponential factor for komplex reactions, reactions of 0., 1. and 2. order, analytical integration of rate laws, Damköhler-number, differential and integral method of kinetic analysis, laboratory reactors for kinetic measurements,	

Engineering"	
	half life, kinetics of complex reactions, parallel reactions, reversible reactions, sequence of reactions, irreversible reaction with pre- equilibrium, reduction of reaction mechanisms, quasi-stationarity principle of Bodenstein, rate limiting step, Michaelis-Menten kinetics, analytical integration of first order differential equations - integrating factor, numerical integration of complex kinetics)
	Types of chemical Reaktors (chemical reactors in industry and laboratory, ideal vs. real reaktors, discontinuous, half continuous and continuous reactors, single phase - biphasic- and multiphase reactors, batch-reactor, semi-batch reactor, CSTR, Plug Flow reactor, fixed bed reactor, adiabatic staged reactors, rotating furnaces, fluidized bed reactors, gas-liquid-reactors, multi-phase reactors)
	Isothermal ideal reactors (mole-balance of a chemical reactor, mole balance of a batch reactor, integration of the batch reactor mole balance for various kinetics, partial fraction decomposition, mole balance of the semi-batch reactor, mole balance of the plug flow reactor, analogy batch reactor - plug flow reactor, design of plug flow reactors for reactions with volume change and complex reactions, mole balance of a fixed bed reactor, design of a membrane reactor, mole balance of a continuously stirred tank reactor, comparison of CSTR and PFR with respect to conversion and selectivity, mole-balance of a cascade of tank reactors, numerical-interative calculation of a cascade of tank reactors, Newton-Raphson method, graphical analysis of a cascade of tank reactors)
	non-isothermal ideal reactors (energy balance of a reactor, adiabatic reactor, adiabatic temperature rise, staged reactor for adiabatic exothermic reactions limited by chemical equilibrium, design of an adiabatic plug flow reactor, Levenspiel-plots, heat transfer through a reactor wall, heat transfer by convection, heat conduction, heat transfer through a cylindrical wall, design of a plug flow reactor in parallel and counter flow, heat balance of the cooling fluid, CSTR with heat exchange, multiple stationary states, ignition-extinction behavior, stability of a CSTR, complex reactions in non-isothermal reactors, optimum temperature profile of a reactor)

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Raimund Horn
Language	DE/EN
Cycle	SoSe
Content	Performing and evaluation of experiments concerning chemical reaction engineering with emphasis on ideal reactors:
	* Batch reactor - Estimation of kinetic parameters for the saponification of ethylacetate
	*CSTR - Residence time distribution, reaction
	*CSTR in Series - Residence time distribution, reaction
	* Plug Flow Reactor - Residence time distribution, reaction
	Before the practical conduct of the experiments a colloquium takes place in which the students explain, reflect and discuss the theoretical basics and their translation into practice.
	The students write up a report for every experiment. They receive feedback to their level of scientific writing (citation methods, labeling of graphs, etc.), so that they can improve their competence in this field over the course of the practical course.

Content	In the Practical Course in Measurement Technology the theory from the lectures "Physical Fundamentals of Measurement Technology" and "Measurement Technology" will be applied in practice. In small groups students learn how to handle different measurement techniques from industry and research. During the practical course, a wide range of different measurement methods will be taught, including the use of HLPC columns for qualitative mass analysis, the determination of mass transfer coefficients using optical oxygen sensors or the evaluation of image data to obtain process parameters. The practical course also teaches how measurement data are statistically evaluated and experiments are correctly documented.

Content	Basic introduction to measurement technology for process engineers. Includes error calculation, measurement units, calibration, measurement data analysis, measurement techniques and sensors. Particular attention is paid to the measurement of temperature, pressure, flow and level. The lecture provides insights into the latest developments in sensor technology in measurement technology and process engineering.

Content	In this course fermentation and downstream technologies on the example of the production of an enzyme by means of a recombinant microorganism is learned. Detailed characterization and simulation of enzyme kinetics as well as application of the enzyme in a bioreactor is carried out. The students document their experiments and results in a protocol.

Furthemore the fundamentals of reaction equilibriaria are taugint.         • Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibriaria are taugint.         • Starting provide parameters in iterature sources.         • Applying their knowledge, the students are able to identify the correct equation for the equilibrium state and it are able to solve the resulting mathematical relations.         • For specific applications, they are able to self-enlantly find necessary physico-chemical properties of compounds as well model parameters in literature sources.         • Beaide prior their the students are able to indentify in the correct paration and reaction processes in chemical engineering.         • Autonomy       • The students are able to find necessary information self-relative in literature sources and to judge their quality.         • The students are able to find necessary information self-relative in literature sour					
Knowledge       - Starting from the very basics of thermodynamics, the students learn the mathematical tools to describe thermodynamics, the students learn thow phase equilibria.         Fire Jean Now state variables are influenced by the mixing of compounds and learn concepts to quantitatively describes properties.         Moreover, the students learn how phase equilibria can be described mathematically and which phenomena may occu different phase (upport liquid, solid) creats in equilibria. Furthemore the fundamentals of reaction equilibria are taught.         Solid       - Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria are taught.         Solid       - Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations meaningfully.         The students know models which can be used to determine the properties of the system in the equilibria state and know how to simplify these equations meaningfully.         The students know how to simplify these equations are capable of describing the properties of compounds as well model parameters in iteracture sources.         Social Compotence       - Ror specific applications, they are able to soft enders are able to understand fundamental concepts that are the basis for m separation and reaction processes in chemical engineering.         Automory       The students are able to work in small groups, to solve the corresponding problems and to present them oraly to the tutors, involvedge the students can adept their learning progress continuously in exercises. Based on thein knowledge, the students are able to check the	Educational Objectives	After taking part successfully, students have reach	ned the following learning results		
Starling from the very basics of thermodynamics, the students learn the mathematical tools to describe thermodyna equilibria.     They learn how state variables are influenced by the mixing of compounds and learn concepts to quantitatively describere properties.     Worever, the students is team how phase equilibria can be described mathematically and which phenomena may occur different phase equilibria, several examples relevant for different kinds of processes are shown and the necess knowledge for plotting and interpreting the equilibria are taught.     Sailis     Applying their knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations meaningfully.     The students knowledge, the students are able to identify the correct equation for the determination of the equilibria state and know how to simplify these equations.     For specific applications, they are able to self-reliantly find necessary physico-chemical properties of compounds as well model parameters in liferature asources.     Beside pure compound properties the students are able to understand fundamental concepts that are the basis for m separation and reaction processes in chemical engineering.     Autonomy     He students are able to work in small groups, to solve the corresponding problems and to present them oraly to the tutors in knowledge the students are able to solve the interval and processes.     Based on their knowledge, the students are able to check their learning progress continuously in exercises. Based on knowledge the students are able to tock their learning progress continuously in exercises. Based on knowledge the students can adept their learning progress.     The students that and their learning progress.     The students that and their learning progress. Focus Renewable Energy: Elective Compulsory Green Technologies. Cycle	SoSe
Content	In the group exercise, the contents of the lecture are taken up and deepened by means of exercises. The exercise tasks correspond in quality and scope to the tasks of the written exam. Topics: Reynolds transport-theorem, pipe flow, free jet, angular momentum, Navier-Stokes equations, potential theory, mock exam, pipe hydraulics, pump design.

Hrs/wk	2
CP	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Michael Schlüter
Language	DE
Cycle	SoSe
Content	In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards.

Lecturer	Prof. Irina Smirnova
Language	DE/EN
Cycle	WiSe
Content	The students work on eight different experiments in this practical course. For every one of the eight experiments, a colloquium
	takes place in which the students explain and discuss the theoretical background and its translation into practice with staff and
	fellow students.
	The students work small groups with a high degree of division of labor. For every experiment, the students write a report. The
	receive instructions in terms of scientific writing as well as feedback on their own reports and level of scientific writing so they can
	increase their capabilities in this area.
	Topics of the practical course:
	<ul> <li>Introduction in the thermal process engineering and to the main features of separation processes</li> </ul>
	Simple equilibrium processes, several steps processes
	Distillation of binary mixtures, enthalpy-concentration diagrams
	Extractive and azeotrope distillation, water vapor distillation, stepwise distillation
	Extraction: separation ternary systems, ternary diagram

Module M1775: Econo	mic and environmental projec	t assessment			
Courses					
Title Case studies economic and environ Basics of Environmental Project Ass Basics of economic project assemer	essment (L0860)	<b>Typ</b> Recitation Section (small) Lecture Lecture	<b>Hrs/wk</b> 1 2 2	СР 1 2 3	
Module Responsible	Prof. Martin Kaltschmitt				
Admission Requirements	None				
Recommended Previous Knowledge	none				
Educational Objectives	After taking part successfully, students have	reached the following learning results			
	On completion of this module, students will be able to analyze and evaluate projects / project ideas from an economic and environmental point of view; i.e. they will be able to systematize / analyze an intended / planned project on the basis of certain criteria and then, with the help of economic and environmental instruments, evaluate such planned projects on the basis of the specific provision costs and selected environmental parameters. Such an approach includes a basic knowledge in the field of economic calculations (e.g. static and dynamic methods) on the one hand and a basic understanding in relation to the preparation of a life cycle assessment / an eco balance on the other hand. In addition, there is the knowledge to implement these instruments for corresponding specific use cases through balance boundaries to be drawn independently by the students and to interpret the results accordingly. The students are able to apply the methods for an economic evaluation (e.g. annuity method) and for an environmental evaluation (e.g. life cycle assessment / eco balance) to different types of projects - and this related to various frame conditions. They will then be able to evaluate corresponding projects (including energy projects, chemical projects) in economic and environmental terms - and on the basis of this - in a systemic manner, and to make statements about the corresponding economic and environmental limitations. Additionally, students are able to orally explain issues from the subject area, approaches to dealing with them, and place them in their respective context.				
Personal Competence Social Competence	Students are able to investigate suitable ter	chnical projects and ultimately evaluate them t	based on econom	ic and environmen	
Autonomy	Students are able to investigate suitable technical projects and ultimately evaluate them based on economic and environmental evaluation criteria - and thus finally under a wide range of sustainability aspects. Students will be able to independently access various sources about the field, acquire knowledge, and transform it to address new issues.

Cycle	WiSe/SoSe
Content	- Organisation, structure and function of procaryotic DNA
	- DNA replication, transcription, translation
	- Regulation of gene expression
	- Mechanisms of gene transfer, recombination, transposition
	- Mutatuion and DNA repair
	- DNA cloning
	- DNA sequencing
	- Polymerase chain reaction
	- Genome sequencing, (meta)genomics, transcriptomics, proteomics

Hrs/wk	2	
CP	3	
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28	
Lecturer	Prof. Andreas Liese	
Language	DE	
Cycle	WiSe	
Content	In groups, the students plan a production plant for a microbial process (up-stream) using the "Bioprocess Trainer" software from Hass & Pörtner "Praxis der Bioprozesstechnik". The design of the production plant should combine two major topics: plant technology (bioreactors, type, power input, gassing, stirrer, scale-up, etc.) and processes strategy (process modes, feeding strategies, etc.). The results are presented in presentations on the current status of the work and a final presentation and summarized in a written elaboration.

Title		Тур	Hrs/wk	СР
Material Engineering (L2894)		Lecture	2	3
Module Responsible	Dr. Marko Hoffmann			
Admission Requirements	None			
<b>Recommended Previous</b>	- Concretend Increasing Chemistry			
Knowledge				
	Phase Equilibria Thermodynamics			
Educational Objectives	After taking part successfully, students have re	ached the following learning results		
Professional Competence				
Knowledge	A basic knowledge of materials science is neces	ssary for the design of process plants a	nd apparatus with the a	ssociated piping. T
	module therefore focuses on ferrous materials,	, although polymer materials and cerar	mics are also covered. A	basic understand
	of atomic structure, microstructure, phase tran	nsformation, diffusion, state diagrams,	and alloy formation, ar	nong other things
	necessary for materials selection and for the	evaluation of corrosion and wear proc	esses, which students s	should acquire in t
	one-semester module. Students will also have			
	essential methods of materials testing and the			
	knowledge of the main types of steel used in p			-
	of steels in practice in the context of time-temp			deathene proces
	of steels in produce in the context of time-temp	Serucine transformation diagrams (TTT	alagrams).	
Skills	Students will be able to select suitable materi	als for the design of process plants ar	nd apparatus. Mechanic	al properties such
	strength, ductility, toughness and fatigue str	rength are taken into account. Stude	nts can also specify m	neasures to increa
	corrosion resistance. In addition to specifying	g strength-increasing measures, stude	ents may select other	measures to mod
	mechanical properties, such as heat treatment	processes.		
Personal Competence				
	The students are able to work out results in g	roups and document them provide ar	opropriate feedback and	l handle feedback
social competence	their own performance constructively.	ioups and document them, provide up		
	their own performance constructively.			
Autonomy	Students are able to independently assess their level of learning and reflect on their weaknesses and strengths in the field o			
	materials engineering. Students are also able to independently seek out information from subject-specific publications and relat			
	this to the context of the course, e.g. when sele	ecting a material for a process engineer	ring apparatus.

Content	This lecture deals with the legal framework of biotechnological and chemical work. On the basis of the acts and ordinacesto be considered (e.g. Occupational Health and Safety Act, Biological Substances Ordinance, Genetic Engineering Act, etc.), the legal frameworks are explained. In addition, requirements for safety classifications of genetic engineering work and the equipment of laboratories for genetic engineering work genetic are presented. Furthermore, national and international requirements for drug production with industrial reference are discussed.	
Literature	Die zum Zeitpunkt der Vorlesung gültigen Gesetze werden in der Vorlesung dargestellt und bekanntgegeben.	

Module M1770: Bioint	formatics				
-					
Courses					
<b>Title</b> Bioinformatics (L2899)	TypHrs/wkCPSeminar23				
Module Responsible	Prof. Johannes Gescher				
Admission Requirements	None				
<b>Recommended Previous</b>	Students should be familiar with the basics of molecular biology and genetics, and have knowledge of microbial cultivation.				
Knowledge	In addition, prior knowledge of DNA sequencing technologies and the phylogenetic tree of life is advantageous. Also helpful is som experience with command line based computer input.				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
	During the course, students gain knowledge of different application areas of DNA sequencing technologies, the potential previously uncharacterized microbial metabolic pathways, how life forms differ in the metabolism of microbes, and the benefits the growth of microbial communities. By the end of the seminar, participants will be familiar with the basics of command line usage and the difficulties of dealing w large data sets. Specifically, applications for analyzing sequencing data will be practiced, as well as interpretation characterizing microbial systems.				
	Topics covered in the course:				
	- Genome sequencing on a MinION				
	- De novo genome assembly				
	- Metagenome analyses				
	- Functional and taxonomic annotation of gene sequences				
	- Construction of phylogenetic trees				
	- Representation of metabolic pathways				
	- Genome mining				
	- Protein structure analyses				
Personal Competence					
Social Competence	Tasks are worked on in groups. Whereby a clear presentation of the used parameters, methods and intermediate results must chosen for communication in the group.				
Autonomy	Students will be able to summarize their findings from the completed subtasks in a report.

82: Management Tutorial
Recitation Section (small)
2
3
Independent Study Time 62, Study Time in Lecture 28
Prof. Christian Lüthje
DE
WiSe/SoSe
In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on so selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Literature Relevante Literatur aus der korrespondierenden Vorlesung.

<b>Recommended Previous</b>	none			
Knowledge				
Educational Objectives	After taking part successfully, students have reached	the following learning results		
Professional Competence				
Knowledge	Upon completion of this module, students will be able to provide an overview of characteristics of renewable energy systems. The will be able to explain the issues that arise in these systems. Furthermore, they are able to explain knowledge of energy supply energy distribution and energy trading in this context, taking into account contexts bordering on specific disciplines. The student can explain this knowledge in detail for such energy systems and take a critical stand on it. Furthermore, they can explain the environmental impact of using renewable energy systems and have an overview of the economic classification of the respectiv options.			
Skills	Students are able to apply methodologies for determining energy demand or energy supply to different types of renewable energy systems. Furthermore, they can evaluate such energy systems technically, ecologically and economically as well as systemicall and also design them under certain given conditions. They are able to select the regulations necessary for this in a subject-specific manner, especially by means of non-standard solutions to a problem. Students are able to orally explain issues from the subject area and approaches to dealing with them and to classify them in the respective context.			
Personal Competence				
Social Competence	Students are able to investigate suitable technical ecological criteria - and thus from a sustainability pe		them based on tech	nnical, economic ar
Autonomy	Students will be able to independently access sources about the field, acquire knowledge and transform it to address new issues.

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Martin Kaltschmitt
Language	DE
Cycle	SoSe
Content	This module includes a presentation of the renewable energy supply and a discussion of the respective technologies for providing the desired final or useful energy. Specifically, this includes the options for solar energy use for heat and power generation (i.e., passive solar energy use, solar collectors for low-temperature heat provision, solar thermal power generation, photovoltaic power generation), wind energy use for power generation (i.e. onshore and offshore wind power use), hydroelectric power use for electricity generation (i.e., run-of-river and storage hydroelectric power), ocean energy use for electricity generation (including tidal power plants), and geothermal energy use for heat and electricity generation (i.e., near-surface use by means of heat pumps, deep geothermal energy use for heat and/or electricity generation).

Language	DE
Cycle	SoSe
Content	This lecture covers all options for energy supply from biomass; this includes the supply of heat, electricity and fuels. The biomass resource and its origin will be discussed first. Afterwards the biomass supply is addressed, which bridges the gap between biomass generation and utilization. Subsequently, the different conversion options are discussed. Only those options are presented in depth that have a corresponding significance on the market in Germany and Europe. This includes (a) heat generation from biogenic solid fuels in small and large-scale plants (b) power generation from solid biomass via combustion (c) a biogas production from residues, by-products and waste, (d) alcohol production from sugar and starch (e) biodiesel production from vegetable oils. Special attention is also paid to the corresponding environmental aspects. An economic classification of the various options is also provided.

	rate constant, reaction order, activation energy, reversible and irreversible reactions, homogeneous and heterogeneous reactions
	elementary steps, molecularity, reaction coordinate, reaction mechanism, quasi steady state principle, Bodenstein principle)
	Measurement of kinetic data in the laboratory on time scales from days to femtoseconds (classic reactor experiments, stopped flow method, flash-photolysis, shock tube experiments, relaxation methods, femtochemistry, molecular beams, pump-probe experiments)
	Kinetics of simple reactions (0. Order, 1. Order, 2. Order, 3. Order, differential and integrated rate laws, integration of rate laws by the method of partial fractions), half-life times, radiocarbon dating, differential kinetic analysis, integral kinetic analysis, isolation method, method of initial reaction rates, parameter estimation in kinetic models by linear and non-linear fitting of rate laws to experimental data
	Kinetics of complex reactions (parallel reactions, reversible reactions, consecutive reactions, consecutive reactions with preceding equilibrium), impact of kinetics on product selectivity and yield, integration of the occurring inhomogeneous ODE's by means of the method of the integrating factor
	Numerical integration of kinetic differential equations, stiffness, accuracy, stability, difference and convergence behavior of explic and implicit solvers, mathematical formulation of complex kinetic reaction networks, numerical implementation in Matlab, Lotka Volterra model, usage of implicit and explicit solvers in Matlab.
	Examples and handling of complex reaction networks, radical chain reactions (non-branched and branched), sensitivity analysis reduction of complex reaction networks and integration of reactor simulations, reaction path analysis, eigenvalue analysis of kinetic systems, stable and unstable solutions, chemical oscillations, Belousov-Zhabotinskii Reaction (mathematical analysis chemical mechanism, origin of oscillations, experimental demonstration).
	Kinetics of heterogeneous catalytic reactions, Langmuir-Hinshelwood-Hougen-Watson rate laws, simplification of LHHW rate laws reaction orders and apparent activation energies in heterogeneous catalysis.
	Theory of chemical reactions and theoretical calculation of rate constants, kinetic theory of gases, Maxwell-Boltzmann distributio of speeds and energy, collision frequencies, simple collision theory, modified collision theory, Transition State Theory, partition functions, Eyring equation.

	dations of Management
Courses	
Title	Typ Hrs/wk CP
Ianagement Tutorial (L0882)	Recitation Section (small) 2 3
ntroduction to Management (L0880	0) Lecture 3 3
Module Responsible	Prof. Christian Lüthje
Admission Requirements	None
<b>Recommended Previous</b>	Basic Knowledge of Mathematics and Business
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	After taking this module, students know the important basics of many different areas in Business and Management, from Plan and Organisation to Marketing and Innovation, and also to Investment and Controlling. In particular they are able to
	<ul> <li>explain the differences between Economics and Management and the sub-disciplines in Management and to n important definitions from the field of Management</li> <li>explain the mest important aspects of and eacle is Management and name the mest important aspects of entremose</li> </ul>
	<ul> <li>explain the most important aspects of and goals in Management and name the most important aspects of entreprine projects</li> </ul>
	<ul> <li>describe and explain basic business functions as production, procurement and sourcing, supply chain managem organization and human ressource management, information management, innovation management and marketing</li> </ul>
	<ul> <li>explain the relevance of planning and decision making in Business, esp. in situations under multiple objectives</li> </ul>
	uncertainty, and explain some basic methods from mathematical Finance
	<ul> <li>state basics from accounting and costing and selected controlling methods.</li> </ul>
Skills	Students are able to analyse business units with respect to different criteria (organization, objectives, strategies etc.) and to o out an Entrepreneurship project in a team. In particular, they are able to
	analyse Management goals and structure them appropriately
	analyse organisational and staff structures of companies
	apply methods for decision making under multiple objectives, under uncertainty and under risk
	analyse production and procurement systems and Business information systems
	analyse and apply basic methods of marketing
	<ul> <li>select and apply basic methods from mathematical finance to predefined problems</li> </ul>
	<ul> <li>apply basic methods from accounting, costing and controlling to predefined problems</li> </ul>
Personal Competence	
	Students are able to
	<ul> <li>work successfully in a team of students</li> </ul>
	<ul> <li>to apply their knowledge from the lecture to an entrepreneurship project and write a coherent report on the project</li> </ul>
	<ul> <li>to communicate appropriately and</li> </ul>
	<ul> <li>to cooperate respectfully with their fellow students.</li> </ul>
Autonomy	Students are able to
	<ul> <li>work in a team and to organize the team themselves</li> </ul>
	<ul> <li>to write a report on their project.</li> </ul>
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70
Credit points	6

Course L08	82: Management Tutorial
Тур	Recitation Section (small)
Hrs/wk	2
СР	3
Workload	Independent Study Time 62, Study Time in Lecture 28
in Hours	
Lecturer	Prof. Christian Lüthje
Language	DE
Cycle	WiSe/SoSe
Content	In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
	If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Literature Relevante Literatur aus der korrespondierenden Vorlesung.

Thesis Module M-001: Bachelor Thesis		
Title Madula Beenensikle	Typ Hrs/wk CP	
Module Responsible Admission Requirements	Professoren der TUHH	
	According to General Regulations §21 (1):	
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.	
<b>Recommended Previous</b>		
Knowledge Educational Objectives	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge Skills	<ul> <li>The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course of study (facts, theories, and methods).</li> <li>On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise.</li> <li>The students are able to outline the state of research on a selected issue in their subject area.</li> <li>The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve subject area.</li> </ul>	
	<ul> <li>subject-related problems.</li> <li>With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.</li> <li>The students can take up a critical position on the findings of their own research work from a specialized perspective.</li> </ul>	
Personal Competence		
Social Competence	<ul> <li>Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and in a structured way.</li> <li>The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the addressees. In doing so they can uphold their own assessments and viewpoints convincingly.</li> </ul>	
Autonomy	<ul> <li>The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a specified time frame.</li> <li>The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.</li> <li>The students can apply the essential techniques of scientific work to research of their own.</li> </ul>
