Module M0528: Maritime Technology and Offshore Wind Parks	92
Module M1354: Advanced Fuels	95
Thesis	98
Module M-002: Master Thesis	98

Program description

Content

In recent decades energy consumption and the associated man-made repercussions on the environment have steadily increased and the (perceived) security of supplies has decreased. This trend can be expected to continue. Increased use of renewable energies - these being hydroelectric, wind and solar power, biomass and geothermal energy - in the electricity, heating and fuel market can make a major contribution toward facing these challenges.

On completing this master's program in Renewable Energies, graduates are able to explain and assess the possibilities of and limits to the provision of energy for the heating, electricity and fuel market by the renewable energy sources sun, geothermal heat and planetary gravitation and movement. These explanations are primarily from the technical but also from the economic and ecological viewpoint. Graduates can provide an overview of the physical and chemical characteristics of renewable energy sources, have understood the fundamental technical principles of their use and can assess the resulting technical and technological requirements of the requisite conversion plant technology. They can also assess the plant and system technology and the economic and ecological basics of the individual options for renewable energy supply. Graduates have an overview of aspects for integration of plants and systems based on renewable energies into the existing energy system - both in Germany and in non-European countries. Furthermore they can discuss issues of energy storage and the development of renewable energy projects with experts. This specialized knowledge and related skills also enable graduates to take up a position on current energy industry issues on a sound and ideology-free basis. As a result of this master's program they are qualified to advise interested parties in a professional capacity or to formulate independently problems and objectives for new application - or research-oriented tasks.

A further in-depth specialization, as a part of the master's program, in the renewable energy system biomass, solar or wind power is possible. Thus, the program provides a comprehensive knowledge on practically all options of renewable energy supply, it's utilization in the energy system - taking existing structures into account - and on selected associated technical, economic and ecological aspects.

Career prospects

The successful completion of the Master's program "Renewable Energies" enables graduates to hold leading positions in the engineering labor market. Typical fields of activities can be found in energy suppliers, energy consultants, project developers, as well as technical authorities in the renewable energy industry. Furthermore, there is the possibility of engaging in activities as a research assistant with the aim of doctoral degree.

Learning target

Graduates of the Master's program "Renewable Energies" will be able to transfer their acquired knowledge of their engineering and scientific study into practice and to broaden it independently if necessary. They can analyse problems using scientific methods to find an engineering solution, even if the problems are "open" or incomplete defined. They are able to work independently in power engineering and in related disciplines. They can apply, critically analyse and further develop new practices and procedures to solve technical and conceptual issues. Graduates are also qualified to develop projects in the field of "Renewable Energies" with an emphasis on:

- Wind energy
- Photovoltaics,
- Hydropower,
- Ocean energy,
- Biomass and
- Geothermal

and to define and schedule these with respect to necessary clarifications and available information.

Program structure

The technical contents of the master are structured as follows:

- Modules of the core skills:
 - technical fundamentals of usage of renewable energy sources,
 - · project evaluation, economy and sustainability,
 - electrical power engineering,
 - non- technical supplementary courses,
- modules of specialization:
 - bioenergy systems,
 - solar energy systems,
 - wind energy systems,
- Master's thesis.

The choice of one specialization is compulsory. Within one specialization courses have to be selected from a catalog of elective courses.

Despite of individual freedom in the choice of courses within the specialization, courses in the core qualification are compulsory for all students. With these courses a balance of formal and practical course content in theory and application of the learning outcomes is ensured.

Non-technical supplementary courses and courses in operation and management provide more flexibility in the individual design of the curriculum and ensure a linkage between technical and business knowledge. These courses can be chosen from the general catalog of the TUHH.

The master thesis with a share of 25% describe the remaining part of the curriculum.

Note: Within the specialization "Solar Energy Systems", students have been given the opportunity to study abroad at the "University of Jordan" in Amman, Jordan. Within this foreign stay, additional modules in the field of "solar energy systems" can be choosen. The earned credits are recognized at TUHH by agreement.

Core Qualification

Within the core qualification of the Master "Renewable energies" the students gain knowledge about the possibilities and limitations of energy supply from the various renewable energy sources for the heat, electricity and fuel market.

Basis for this aim are on one hand the courses of consecutive Bachelor courses and on the other hand continuing and applied courses in the field of electrical engineering, thermodynamics and fluid mechanics.

Continuing to these courses the different principles for the use of renewable energies and the resulting requirements on the corresponding conversion plant technology are presented, primarily from a technical perspective. Nonetheless, this knowledge is linked to economic and environmental context, to understand and to evaluate the integration of renewable energy applications in energy systems - both in Germany, Europe and countries outside Europe. Furthermore, energy storage opportunities are discussed in this context.

Within the module "Projects and their Assessment", non-technical aspects of the implementation of projects especially in the field of renewable energies are considered, to provide background information in the legal and economic energy implementation of renewable energy applications.

Module M0508: Fluid Mechanics and Ocean Energy

Courses Title Energy from the Ocean (L0002)

Energy from the Ocean (L0002)			Lecture	2	2
Fluid Mechanics II (L0001)			Lecture	2	4
Module Responsible	Prof. Michael Schlüte	r			
Admission Requirements	None				
Recommended Previous	Technische Thermod	ynamik I-II			
Knowledge	Wärme- und Stoffübe	ertragung			
Educational Objectives	After taking part suc	cessfully, students have rea	ched the following learning results		
Professional Competence					
Knowledge	The students are abl	e to describe different appli	cations of fluid mechanics for the field	of Renewable Energi	es. They are able to u
	the fundamentals of	fluid mechanics for calculat	ions of certain engineering problems i	n the field of ocean e	nergy. The students ar
	able to estimate if a	problem can be solved with	an analytical solution and what kind	of alternative possib	ilities are available (e.
	self-similarity, empir	cal solutions, numerical me	thods).		
Skills	Students are able to	use the governing equatior	ns of Fluid Dynamics for the design of	technical processes.	Especially they are ab
	to formulate momen	tum and mass balances to	optimize the hydrodynamics of techn	ical processes. They	are able to transform
	verbal formulated m	essage into an abstract forn	nal procedure.		
Personal Competence					
Social Competence	The students are ab	e to discuss a given proble	m in small groups and to develop an	approach. They are	able to solve a proble
	within a team, to pre	pare a poster with the resul	ts and to present the poster.		
Autonomy	Students are able to define independently tasks for problems related to fluid mechanics. They are able to work out the knowled		work out the knowled		
,			elves on the basis of the existing know	•

Admission Requirements	-
Recommended Previous	None
Knowledge	
	After taking part successfully, students have reached the following learning results
Professional Competence Knowledae	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover full Self-reliance, self-management, collaboration and professional and personnel management competences. The departme implements these training objectives in its teaching architecture , in its teaching and learning arrangements , in teach areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechn complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechn academic programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual development competences. It also provides orientation knowledge in the form of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation study these subjects in one or two specific semesters during the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dea with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are delibera encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical stud communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the wir semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start- in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging georiented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. Th differences are reflected in the practical examples used, in content topics that refer to different professional application conte and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leaders functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 explain specialized areas in context of the relevant non-technical disciplines, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representa in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
Skills	Professional Competence (Skills)
	In selected sub-areas students can
	 apply basic and specific methods of the said scientific disciplines, aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned special discipline, to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond

Module Manual M.Sc. "Renewable Energies"

Courses

Personal Competence	Personal Competences (Social Skills)
Social competence	
	Students will be able
	• to learn to collaborate in different manner,
	 to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,
	• to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),
	 to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	• to reflect on their own profession and professionalism in the context of real-life fields of application
	to organize themselves and their own learning processes
	 to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses

,	1) Markets for Agricultural Commodities
	What are the major markets and how are markets functioning
	Recent trends in world production and consumption.
	World trade is growing fast. Logistics. Bottlenecks.
	The major countries with surplus production
	Growing net import requirements, primarily of China, India and many other countries.
	Tariff and non-tariff market barriers. Government interferences.
	2) Closer Analysis of Individual Markets
	Thomas Mielke will analyze in more detail the global vegetable oil markets, primarily palm oil, soya oil,
	rapeseed oil, sunflower oil. Also the raw material (the oilseed) as well as the by-product (oilmeal) will
	be included. The major producers and consumers.
	Vegetable oils and oilmeals are extracted from the oilseed. The importance of vegetable oils and
	animal fats will be highlighted, primarily in the food industry in Europe and worldwide. But in the past
	15 years there have also been rapidly rising global requirements of oils & fats for non-food purposes,
	primarily as a feedstock for biodiesel but also in the chemical industry.
	Importance of oilmeals as an animal feed for the production of livestock and aquaculture
	Oilseed area, yields per hectare as well as production of oilseeds. Analysis of the major oilseeds
	worldwide. The focus will be on soybeans, rapeseed, sunflowerseed, groundnuts and cottonseed.
	Regional differences in productivity. The winners and losers in global agricultural production.
	3) Forecasts: Future Global Demand & Production of Vegetable Oils
	Big challenges in the years ahead: Lack of arable land for the production of oilseeds, grains and other
	crops. Competition with livestock. Lack of water. What are possible solutions? Need for better
	education & management, more mechanization, better seed varieties and better inputs to raise yields.
	The importance of prices and changes in relative prices to solve market imbalances (shortage
	situations as well as surplus situations). How does it work? Time lags.
	Rapidly rising population, primarily the number of people considered "middle class" in the years ahead.
	Higher disposable income will trigger changing diets in favour of vegetable oils and livestock products.
	Urbanization. Today, food consumption per caput is partly still very low in many developing countries,
	primarily in Africa, some regions of Asia and in Central America. What changes are to be expected?
	The myth and the realities of palm oil in the world of today and tomorrow.
	Labour issues curb production growth: Some examples: 1) Shortage of labour in oil palm plantations in
	Malaysia. 2) Structural reforms overdue for the agriculture in India, China and other countries to become more productive and successful, thus improving the standard of living of smallholders.
	become more productive and successful, thus improving the standard of iving of smallholders.

Content	The experiments of the practical lab course illustrate the different aspects of heat generation from biogenic solid fuels. First, different biomasses (e.g. wood, straw or agricultural residues) will be investigated; the focus will be on the calorific value of the biomass. Furthermore, the used biomass will be pelletized, the pellet properties analysed and a combustion test carried out on a pellet combustion system. The gaseous and solid pollutant emissions, especially the particulate matter emissions, are measured and the composition of the particulate matter is investigated in a further experiment. Another focus of the practical course is the consideration of options for the reduction of particulate matter emissions from biomass combustion. In the practical course, a method for particulate matter reduction will be developed and tested. All experiments will be evaluated and the results presented. Within the practical lab course the students discuss different technical-scientific tasks, both subject-specifically and interdisciplinary. They

Module M1303: Energy Projects - Development and Assessment

economic requirements. As a basis for the design of renewable energy systems they can calculate the demand for thermal and/or electrical energy a operating and regional level. Regarding to this calculation they can choose and dimension possible energy systems. To assess sustainability aspects of renewable energy projects, the students can choose and discuss the right methodology according to the particular task. Through active discussions of various topics within the seminars and exercises of the module, students improve the understanding and the application of the theoretical background and are thus able to transfer what they have learned in practice. Personal Competence Students will be able to edit scientific tasks in the context of the economic analysis of renewable energy projects in a group with high number of participants and can organize the processing time within the group. They can perform subject-specific an interdisciplinary discussions. Consequently, they can asses the knowledge of their fellow students and are able to deal wit feedback on their own performance. Students can present their group results in front of others. Autonomy Regarding to the contents of the lectures and to solve the tasks for the economical analysis of renewable energy projects the students are able to exploit sources and acquire the particular knowledge about the subject area independently and self

Content	The lecture "Sustainability Management" gives an insight into the different aspects and dimensions of sustainability. First, essential terms and definitions, significant developments of the last years, and legal framework conditions are explained. The various aspects of sustainability are then presented and discussed in detail. The lecture mainly focuses on concepts for the implementation of the topic sustainability in companies:
	 What is "sustainability"? Why is this concept an important topic for companies? What opportunities and business risks are addressed or are associated with it? How can the often mentioned three pillars of sustainability - economy, ecology, and social- be meaningfully integrated into corporate management despite their sometimes contradictory tendencies, and how a corresponding compromise can be found? What concepts or frameworks exist for the implementation of sustainability management in companies? Which sustainability labels exist for products or companies? What do they have in common, and where do they differ? Furthermore, the lecture is intended to provide insights into the concrete implementation of sustainability aspects into business practice. External lecturers from companies will be invited to report on how sustainability is integrated into their daily processes. In the course of an independently carried out group work, the students will analyze and discuss the implementation of sustainability aspects based on short case studies. By studying and comparing best practice examples, the students will learn about corporate decisions' effects and implications. It should become clear which risks or opportunities are associated if sustainability aspects are taken into account in management decisions.

Course L0014: Renewable En	ergy Projects in Emerged Markets
Тур	Project Seminar
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Andreas Wiese
Language	DE
Cycle	WiSe
Content	
	1. Introduction
	 Development of renewable energies worldwide
	 History
	Future markets
	 Special challenges in new markets - Overview
	2. Sample project wind farm Korea
	• Survey
	 Technical Description
	 Project phases and characteristics
	3. Funding and financing instruments for EE projects in new markets
	Overview funding opportunitie
	Overview countries with feed-in laws
	 Major funding programs
	4. CDM projects - why, how , examples
	Overview CDM process
	• Examples
	• Exercise CDM
	5. Rural electrification and hybrid systems - an important future market for EE
	Rural Electrification - Introduction
	Types of Elektrizifierungsprojekten
	 The role of the EEInterpretation of hybrid systems
	Project example: hybrid system Galapagos Islands
	6. Tendering process for EE projects - examples
	South Africa
	• Brazil
	7. Selected projects from the perspective of a development bank - Wesley Urena Vargas, KfW Development Bank
	Geothermal
	• Wind or CSP
	Within the seminar, the various topics are actively discussed and applied to various cases of application.

Workload in Hours	Independent Study Time 16, Study Time in Lecture 14
Lecturer	Prof. Andreas Wiese
Language	DE
Cycle	WiSe
Content	 Introduction: definitions; importance of cost and profitability statements for projects in the "Renewable Energies"; price costs; efficiency of energy systems versus profitability of individual project Cost estimates and cost calculations Definitions Cost calculation Cost estimation Cost estimation Calculation of costs for the provision of work and power Cost summaries for renewable energy technologies Energy Storage: cost overviews; impact on the cost of renewable energy projects Efficiency calculation Definitions Efficiency calculation Definitions Methods: static methods, dynamic methods (eg. LCOE (levelised cost of electricity)) Economic versus national economic approach Power and work in cost accounting Energy storage and its influence on the efficiency calculation The due diligence process as an attendant of economic analysis Consideration of uncertainty in projects for renewable energy Definitions Technical uncertainty Cost uncertainties Other uncertainties
	• Definitions
	Project -versus corporate finance Eurofing models
	 Funding models Equity ratio , DSCR
	 Equity ratio, DSCR Treatment of risks in project financing
	 Funding opportunities for renewable energy projects
	 Possible funding approaches
	 Legal requirements in Germany (EEG)
	Eligar requirements in Germany (EEG) Emissions trading and carbon credits

Cycle	
Content	Photovoltaics:
	1. Introduction
	 Primary energies and consumption, available solar energy
	3. Physics of the ideal solar cell
	 Light absorption, PN transition, characteristic sizes of the solar cell, efficiency
	5. Physics of the real solar cell
	6. Charge carrier recombination, characteristic curves, barrier layer recombination, equivalent circuit diagram
	7. Increasing efficiency
	8. Methods for increasing the quantum yield and reducing recombination
	9. Hetero- and tandem structures
	10. Heterojunction, Schottky, electrochemical, MIS and SIS cell, tandem cell
	11. Concentrator cells
	12. Concentrator optics and tracking systems, concentrator cells
	13. Technology and properties: solar cell types, manufacturing, monocrystalline silicon and gallium arsenide, polycrystal
	silicon and silicon thin film cells, thin film cells on carriers (amorphous silicon, CIS, electrochemical cells)
	14. Modules
	15. Switches
	Concentrating solar power plants:
	1. Introduction
	2. Point focused technologies
	3. Line focused technologies
	4. Design of CSP projects

Energy Trading (L0020)		Recitation Section (small)	1	1			
Deep Geothermal Energy (L0025)	Lecture 2 2						
-	Prof. Martin Kaltschmitt						
Admission Requirements	None						
	Module: Technical Thermodynamics I						
Knowledge	Module: Technical Thermodynamics II						
Educational Objectives	After taking part successfully, students have reached the fol	llowing learning results					
Professional Competence							
	Students are able to describe the processes in energy tradir	ng and the design of energy marke	ets and can critic	ally evaluate them			
	relation to current subject specific problems. Furtherm						
	electrochemical energy conversion in fuel cells and can es	tablish and explain the relationsh	ip to different ty	pes of fuel cells ar			
	their respective structure. Students can compare this techn	ology with other energy storage o	ptions. In additio	on, students can giv			
	an overview of the procedure and the energetic involvemen	t of deep geothermal energy.					
Skills	Students can apply the learned knowledge of storage syster	ms for excessive energy to explair	n for various ene	rgy systems differe			
	approaches to ensure a secure energy supply. In particular, they can plan and calculate domestic, commercial and industria						
	heating equipment using energy storage systems in an energy-efficient way and can assess them in relation to complex power						
	systems. In this context, students can assess the potentia	al and limits of geothermal powe	er plants and ex	plain their operati			
	mode.						
	Furthermore, the students are able to explain the procedure	and strategies for marketing of	energy and app	ly it in the context			
	other modules on renewable energy projects. In this context they can unassistedly carry out analysis and evaluations of ene markets and energy trades.						
Personal Competence							
Social Competence	Students are able to discuss issues in the thematic fields in	the renewable energy sector addr	essed within the	module.			
Autonomy	Students can independently exploit sources , acquire the particular knowledge about the subject area and transform it to new						
	questions.

Biorefineries - Technical Design an	-	Project-/problem-based Learning	3	3	
CAPE in Energy Engineering (L0022		Projection Course	3	3	
-	Prof. Martin Kaltschmitt				
Admission Requirements					
Recommended Previous Knowledge	Bachelor degree in Process Engineering, Bioprocess En	gineering or Energy- and Environmental E	ngineering		
Educational Objectives	After taking part successfully, students have reached t	ne following learning results			
Professional Competence					
Knowledge	The tudents can completely design a technical proce process devices, layout of measurement- and control s Furthermore, they can describe the basics of the gene PLUS ® and ASPEN CUSTOM MODELER ®.	ystems as well as modeling of the overall	process.		
Skills	Students are able to simulate and solve scientific task	n the context of renewable energy techno	logies by:		
	 development of modul-comprehensive approaches for the dimensioning and design of production processes evaluating alternatives input parameter to solve the particular task even with incomplete information, a systematic documentation of the work results in form of a written version, the presentation itself and the defense of contents. 				
	They can use the ASPEN PLUS ® and ASPEN CUSTOM MODELER ® for modeling energy systems and to evaluate the simulations.				
	Through active discussions of various topics within the seminars and exercises of the module, stu understanding and the application of the theoretical background and are thus able to transfer what they have				
Personal Competence					
Social Competence	Students can				
	 respectfully work together as a team with aroun participate in subject-specific and interdiscipli processes, and can develop cooperated solution defend their own work results in front of fellow set of the set of th	nary discussions in the area of dimens s,	y discussions in the area of dimensioning and design of pro		
	assess the performance of fellow students in compar constructive criticism.	sess the performance of fellow students in comparison to their own performance. Furthermore, they can a instructive criticism.			
Autonomy	Students can independently tap knowledge regarding to the given task. They are capable, in consultation with supervisors assess their learning level and define further steps on this basis. Furthermore, they can define targets for new application research-oriented duties in accordance with the potential social, economic and cultural impact.

Course L1832: Biorefineries	- Technical Design and Optimization
Тур	Project-/problem-based Learning
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Prof. Oliver Lüdtke
Language	DE
Cycle	SoSe
Content	
	I. Repetition of engineering basics
	1. Shell and tube heat exchangers
	2. Steam generators and refrigerating machines
	3. Pumps and turbines
	4. Flow in piping networks
	5. Pumping and mixing of non-newtonian fluids
	6. Requirements to a detailed layout plan
	II. Calculation:
	 Planning and design of a specific bio-refinery plant section, such as Ethanol distillation and fermentation. This is based on empirical valuse of a real, industrial plant.
	• Mass and energy balances (Aspen)
	• Equipment design (heat exchangers, pumps, pipes, tanks, etc.) (
	 Isolation, wall thickness and material selection Energy demand (electrical, heat or seeling), design of steam bellers and appliances
	 Energy demand (electrical, heat or cooling), design of steam boilers and appliances Selection of fittings, measuring instruments and safety equipment
	 Definition of main control loops
	 Hereby, the dependencies of transport phenomena between certain plant sections become evident and methods of calculation are introduced.
	 In Detail Engineering , it is focused on aspects of plant engineering planning that are relevant for the subsequent construction of the plant.
	4. Depending of time requirement and group size a cost estimation and preparation of a complete R&I flow chart can be implemented as well.

CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Prof. Martin Kaltschmitt
Language	DE
Cycle	SoSe
Content	• CAPE = <i>Computer</i> -Aided-Project-Engineering
	INTRODUCTION TO THE THEORY
	 Classes of simulation programs
	 Sequential modular approach
	 Equation-oriented approach
	 Simultaneous modular approach
	 General procedure for the processing of modeling tasks
	 Special procedure for solving models with repatriations
	COMPUTER EXERCISES renewable energy projects WITH ASPEN PLUS ® AND ASPEN CUSTOM MODELER ®
	 Scope, potential and limitations of Aspen Plus [®] and Aspen Custom Modeler [®]
	Use of integrated databases for material data
	Methods for estimating non-existent physical property data
	Use of model libraries and Process Synthesis
	 Application of design specifications and sensitivity analyzes Solving entimization problems
	 Solving optimization problems
	Within the seminar, the various tasks are actively discussed and applied to various cases of application.

Specialization Bioenergy Systems

In the specialization "Bioenergy systems" advanced knowledge for the energetic utilisation of biomass is provided. This implicates, inter alia, the processing and use of wood as an energy resource, but also an understanding about procedures and concepts which enable energy recovery from waste.

waste.

Content	The students receive the assignment in the form of a material design for test bodies made of fibre composites. Technical and normative requirements are listed in the assignment, all other required information comes from the lectures and exercises or the respective documents (electronically and in conversation). The procedure is specified in a milestone plan and enables the students to plan subtasks and thus work continuously. At the end of the project, different test specimens were tested in tensile or bending tests. In the individual project meetings, the conception (discussion of requirements and risks) is scrutinised. The calculations are analysed, the production methods are evaluated and determined. Materials are selected and the test specimens are manufactured according to standards. The quality and mechanical properties are checked and classified. At the end, a final report is prepared and the results are presented to all participants in the form of a presentation and discussed. Cycle	SoSe
	The lecture offers a general introduction to the basics and possibilities of applied mathematical optimization and deals with application areas on different scales from kinetics identification, optimal design of unit operations to the optimization of entire (sub)processes, and production planning. In addition to the basic classification and formulation of optimization problems, different solution approaches are discussed. Besides deterministic gradient-based methods, metaheuristics such as evolutionary and genetic algorithms and their application are discussed as well. - Introduction to Applied Optimization - Formulation of optimization problems - Linear Optimization - Nonlinear Optimization - Mixed-integer (non)linear optimization - Multi-objective optimization

Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.

Content	The focus is on getting to know the organization and practice of waste management companies. Topics such as planning, financing and logistics will be discussed and there will be an excursion (waste incineration plant, vehicle fleet and collection systems / containers). Project based learning: You will be given a task to work on independently in groups of 4 to 6 students. All tools and data needed for the project work will be discussed in the lecture "Recycling Technologies and Thermal Waste Treatment". Course documents can be downloaded from StudIP. Communication during the project work also takes place via StudIP.

Specialization Solar Energy Systems

Within the specialization "Solar Energy Systems" further knowledge is gained in the theoretical functioning of photovoltaic cells and the properties of used materials. In addition, further information on the design, management and optimization of electrical energy systems are part in this specialization in order to demonstrate and evaluate the challenges of using solar energy systems in existing networks.

Within the specialization "Solar Energy Systems", students have been given the opportunity to study abroad at the "University of Jordan" in Amman, Jordan. Within this foreign stay, additional modules in the field of "solar energy systems" can be choosen. The earned ECTS are recognized at TUHH by agreement.

In addition, students in the "Solar Energy Systems" course can take the module "Modeling and Simulation of Building Integrated Solar Energy Systems" in cooperation with the International Hellenic University in Thessaloniki, Greece, which can be recognized by TUHH. The Exchange is also encouraged.

Students, who are planning to choose the specialization "Solar Energy Systems" are kindly requested to contact the head of the program early for further information about the course of studies and their stay abroad.

Skills		d evaluating complex systems of sensing devices em-oriented understanding of the measurement eq		ted communication
Personal Competence Social Competence	Students can communicate the discussed	technologies using the English language.		
Autonomy	Students are capable of gathering necessary information from provided references and relate this information to the lecture. Th are able to continually reflect their knowledge by means of activities that accompany the lecture. Based on respective feedbac students are expected to adjust their individual learning process. They are able to draw connections between their knowled obtained in this lecture and the content of other lectures (e.g. Fundamentals of Electrical Engineering, Analysis, Stochast Processes, Communication Systems).

Module M1425: Powe	r electronics			
Courses				
Title Power electronics (L2053)		Typ Lecture	Hrs/wk	CP 4
Power electronics (L2054)		Recitation Section (small)	2	2
Module Responsible	Prof. Martin Kaltschmitt			
Admission Requirements	None			
Recommended Previous	Basics of Electrical Engineering			
Knowledge				
Educational Objectives	After taking part successfully, students	have reached the following learning results		
Professional Competence				
Knowledge	The students are taught the basics of power converter technology and modern power electronics. Furthermore, the essent properties of conventional and modern power semiconductors will be presented and their driving techniques will be presented. T			
	students also learn about the most imp	ortant circuit topologies of self-commutated power c	onverters and thei	r control methods.
Skills	s In addition to the basics of power converter commutation, the students learn methods for determining the on-state and switchin			
	losses of the components. Using simple examples, the participants will learn methods for the mathematical descript			
	transmission behavior of power electro	nic circuits.		
Personal Competence				
		ns in related topics in the field of photovoltaics and p		
Autonomy		s sources based on the main topics of the lectures ar	id transfer the acq	uired knowledge to
	wider field

Lecturer	Prof. Bodo Fiedler
Language	DE/EN
Cycle	SoSe
Content	The students receive the assignment in the form of a material design for test bodies made of fibre composites. Technical and normative requirements are listed in the assignment, all other required information comes from the lectures and exercises or the respective documents (electronically and in conversation). The procedure is specified in a milestone plan and enables the students to plan subtasks and thus work continuously. At the end of the project, different test specimens were tested in tensile or bending tests. In the individual project meetings, the conception (discussion of requirements and risks) is scrutinised. The calculations are analysed, the production methods are evaluated and determined. Materials are selected and the test specimens are manufactured according to standards. The quality and mechanical properties are checked and classified. At the end, a final report is prepared and the results are presented to all participants in the form of a presentation and discussed. Content	The lecture provide an insight into the various possibilities of fuel cells in the energy system (electricity, heat and transport). These are presented and discussed for individual fuel types and application-oriented requirements; also compared with alternative technologies in the system. These different possibilities will be presented regardind the state-of-the-art development of the technologies and exemplary applications from Germany and worldwide. Also the emerging trends and lines of development will be discussed. Besides to the technical aspects, which are the focus of the event, also energy, environmental and industrial policy aspects are discussed - also in the context of changing circumstances in the German and international energy system.

Knowledge	transfer.			
Educational Objectives	After taking part successfully, students have reached the following	ng learning results		
Professional Competence				
Knowledge	Students are able to:			
	describe transport processes in single- and multiphase flo	ws and they know the analogy h	atween heat-	and mass transfer
	well as the limits of this analogy.	ws and they know the analogy b		
	 explain the main transport laws and their application as w 	ell as the limits of application.		
	 describe how transport coefficients for heat- and mass tra 		allv.	
	compare different multiphase reactors like trickle bed rea			column reactors.
	 are known. The Students are able to perform mass and energy balances for different kind of reactors. Further more th 			
	industrial application of multiphase reactors for heat- and mass transfer are known.			
Skills	The students are able to:			
	 antimize multiphace reactors by using mass, and energy balances 			
	 optimize multiphase reactors by using mass- and energy balances, use transport processor for the design of technical processor. 			
	 use transport processes for the design of technical processes, to choose a multiplace reactor for a specific application. 			
	• to choose a multiphase reactor for a specific application.			
Personal Competence				
Social Competence	The students are able to discuss in international teams in english and develop an approach under pressure of time.			
Autonomy	Students are able to define independently tasks, to solve the	problem "design of a multiphas	e reactor". T	he knowledge that
	necessary is worked out by the students themselves on the basis of the existing knowledge from the lecture. The students are able			
	to decide by themselves what kind of equation and model is applicable to their certain problem. They are able to organize their			
	own team and to define priorities for different tasks.

Content	In this Problem-Based Learning unit the students have to design a multiphase reactor for a fast chemical reaction concerning optimal hydrodynamic conditions of the multiphase flow.			
	The four students in each team have to:			
	 collect and discuss material properties and equations for design from the literature, 			
	calculate the optimal hydrodynamic design,			
	check the plausibility of the results critically,			
	write an exposé with the results.			
	This exposé will be used as basis for the discussion within the oral group examen of each team.

Specialization Wind Energy Systems

Within the specialization "Wind Energy Systems" advanced knowledge for the utilization of wind energy in the offshore as well as in the onshore sector is provided. In particular, maritime and logistical constraints during the installation and use of offshore wind farms are discussed. In this context, the management of risks which may occur during construction and operation of such large energy projects are explained.

In addition, in a separate module, the material-specific basis for the composition of components of wind turbines is provided.

Content	Port Logistics deals with the planning, control, execution and monitoring of material flows and the associated information flows in the port system and its interfaces to numerous actors inside and outside the port area.
	The extraordinary role of maritime transport in international trade requires very efficient ports. These must meet numerous requirements in terms of economy, speed, safety and the environment. Against this background, the lecture Port Logistics deals with the planning, control, execution and monitoring of material flows and the associated information flows in the port system and its interfaces to numerous actors inside and outside the port area. The aim of the lecture Port Logistics is to convey an understanding of structures and processes in ports. The focus will be on different types of terminals, their characteristical layouts and the technical equipment used as well as the ongoing digitization and interaction of the players involved.
	In addition, renowned guest speakers from science and practice will be regularly invited to discuss some lecture-relevant topics from alternative perspectives.
	 The following contents will be conveyed in the lectures: Instruction of structures and processes in the port Planning, control, implementation and monitoring of material and information flows in the port Fundamentals of different terminals, characteristical layouts and the technical equipment used Handling of current issues in port logistics

Content	The content of the exercise is the independent preparation of a scientific paper plus an accompanying presentation on a current topic of port logistics. The paper deals with current topics of port logistics. For example, the future challenges in sustainability and productivity of ports, the digital transformation of terminals and ports or the introduction of new regulations by the International Maritime Organization regarding the verified gross weight of containers. Due to the international orientation of the event, the paper is to be prepared in English.

	The general tasks of maritime logistics include the planning, design, implementation and control of material and information flows in the logistics chain ship - port - hinterland. The aim of the course is to provide students with knowledge of maritime transport and the actors involved in the maritime transport chain. Typical problem areas and tasks will be dealt with, taking into account the economic development. Thus, classical problems as well as current developments and trends in the field of maritime logistics are considered. In the lecture, the components of the maritime logistics chain and the actors involved will be examined and risk assessments of human disturbances on the supply chain will be developed. In addition, students learn to estimate the potential of digitisation in maritime shipping, especially with regard to the monitoring of ships. In addition, students are able to design operational planning for fleets of container or tramp vessels. Further content of the lecture is the different modes of transport in the hinterland, which students can evaluate after completion of the course regarding their advantages and disadvantages.

Content	The exercise lesson bases on the haptic management game MARITIME. MARITIME focuses on providing knowledge about structures and processes in a maritime transport network. Furthermore, the management game systematically provides process management methodology and also promotes personal skills of the participants.

Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Bodo Fiedler
Language	DE/EN
Cycle	SoSe
Content	The students receive the assignment in the form of a material design for test bodies made of fibre composites. Technical and normative requirements are listed in the assignment, all other required information comes from the lectures and exercises or the respective documents (electronically and in conversation). The procedure is specified in a milestone plan and enables the students to plan subtasks and thus work continuously. At the end of the project, different test specimens were tested in tensile or bending tests. In the individual project meetings, the conception (discussion of requirements and risks) is scrutinised. The calculations are analysed, the production methods are evaluated and determined. Materials are selected and the test specimens are manufactured according to standards. The quality and mechanical properties are checked and classified. At the end, a final report is prepared and the results are presented to all participants in the form of a presentation and discussed. Content	The lecture provide an insight into the various possibilities of fuel cells in the energy system (electricity, heat and transport). These are presented and discussed for individual fuel types and application-oriented requirements; also compared with alternative technologies in the system. These different possibilities will be presented regardind the state-of-the-art development of the technologies and exemplary applications from Germany and worldwide. Also the emerging trends and lines of development will be discussed. Besides to the technical aspects, which are the focus of the event, also energy, environmental and industrial policy aspects are discussed - also in the context of changing circumstances in the German and international energy system.

	The lecture offers a general introduction to the basics and possibilities of applied mathematical optimization and deals with application areas on different scales from kinetics identification, optimal design of unit operations to the optimization of entire (sub)processes, and production planning. In addition to the basic classification and formulation of optimization problems, different solution approaches are discussed. Besides deterministic gradient-based methods, metaheuristics such as evolutionary and genetic algorithms and their application are discussed as well. - Introduction to Applied Optimization - Formulation of optimization problems - Linear Optimization - Nonlinear Optimization - Multi-objective optimization - Global optimization

Course achievement	Compulsory Bonus	Form	Description			
	Yes 20 %	Written elaboration	Details werde	n in der ersten Veranstaltu	ng bekannt gegel	ben.
Examination	Written exam					
Examination duration and	120 min					
scale						
Assignment for the	Bioprocess Engineering	g: Specialisation A - Gen	eral Bioprocess Eng	gineering: Elective Compul	sory	
Following Curricula	Bioprocess Engineering	g: Specialisation B - Indu	strial Bioprocess E	ngineering: Elective Compu	ulsory	
	Bioprocess Engineerin	g: Specialisation C - Bio	economic Process	Engineering, Focus Energ	y and Bioprocess	Technology: Elect
	Compulsory					
	Energy Systems: Spec	alisation Energy System	s: Elective Compul	sory		
	Environmental Enginee	ering: Specialisation Ene	rgy and Resources	: Elective Compulsory		
	Aircraft Systems Engin	eering: Core Qualificatio	on: Elective Compul	lsory		
				nd Logistics: Elective Comp	-	
	-			and Mobility: Elective Con	npulsory	
	Renewable Energies: S	pecialisation Wind Energ	gy Systems: Electiv	ve Compulsory		
	-	pecialisation Solar Energ				
	-	pecialisation Bioenergy				
		pecialisation Process En				
		pecialisation Chemical P				
	Process Engineering, S	pecialisation Environme	ntal Process Engine	eering: Elective Compulsor		

Course L2414: Second gener	ourse L2414: Second generation biofuels and electricity based fuels	
Тур	Lecture	
Hrs/wk	2	
СР	2	
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28	
Lecturer	Prof. Martin Kaltschmitt	
Language	DE/EN	
Cycle	WiSe	
Content	 General overview of various power-based fuels and their process paths, including power-to-liquid process (Fischer-Tropsch synthesis, methanol synthesis), power-to-gas (Sabatier process) Origin, production and use of these fuels 	
Literature	Vorlesungsskript	

Course L1926: Carbon dioxid	e as an economic determinant in the mobility sector
Тур	Lecture
Hrs/wk	1
СР	1
Workload in Hours	Independent Study Time 16, Study Time in Lecture 14
Lecturer	Dr. Karsten Wilbrand
Language	DE/EN
Cycle	WiSe
Content	 General overview of various advanced biofuels and their process pathways (including gas-to-liquid, HEFA and Alcohol-to-Jet processes) Origin, production and use of these fuels
Literature	 Babu, V.: Biofuels Production. Beverly, Mass: Scrivener [u.a.], 2013 Olsson, L.: Biofuels. Berlin, Heidelberg: Springer-Verlag Berlin Heidelberg, 2007 William, L. L.: Distillation Design and Control Using Aspen Simulation; ISBN-10: 0-471-77888-5 Perry, R.; Green, R.: Perry's Chemical Engineers' Handbook, 8th Edition, McGraw Hill Professional, 20 Sinnot, R. K.: Chemical Engineering Design, Elsevier, 2014 Kaltschmitt, M.; Neuling, U. (Ed.): Biokerosene - Status and Prospects; Springer, Berlin, Heidelberg, 2018

Course L2416: Mobility and climate protection			
Тур	Recitation Section (small)		
Hrs/wk	2		
СР	2		
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28		
Lecturer	Dr. Benedikt Buchspies, Dr. Karsten Wilbrand		
Language	DE/EN		
Cycle	WiSe		
Content	Application of the acquired theoretical knowledge from the respective lectures on the basis of concrete tasks from practice		
	Design and simulation of sub-processes of production processes in Aspen Plus ®		
	Ecological and economic analysis of fuel supply paths		
	Classification of case studies into applicable regulations		
Literature	Skriptum zur Vorlesung		
	Aspen Plus® - Aspen Plus User Guide		

Course L2415: Sustainability	aspects and regulatory framework
Тур	Lecture
Hrs/wk	1
СР	1
Workload in Hours	Independent Study Time 16, Study Time in Lecture 14
Lecturer	Dr. Benedikt Buchspies
Language	DE/EN
Cycle	WiSe
Content	 Holistic examination of the different fuel paths with the following main topics, among others: Consideration of the environmental impact of the various alternative fuels Economic consideration of the different alternative fuels Regulatory framework for alternative fuels Certification of alternative fuels Market introduction models of alternative fuels
Literature	 European Commission - Joint Research Center (2010): International Reference Life Cycle Data System (ILCD) Handbook - General guide for Life Cycle Assessment - Detailed guidance. Joint Research Center (JRC) Institut for Environment and Sustainability, Luxembourg Richtlinie (EU) 2018/2001 des Europäischen Parlaments und des Rates vom 11. Dezember 2018 zur Förderung der Nutzung von Energie aus erneuerbaren Quellen

	Thesis
Module M-002: Maste	r Thesis
Courses	
ïtle	Typ Hrs/wk CP
Module Responsible	Professoren der TUHH
Admission Requirements	A According to Consul Deputations \$21 (1):
	According to General Regulations §21 (1):
	At least 60 credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	• The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specializ
	issues.
	• The students can explain in depth the relevant approaches and terminologies in one or more areas of their subjection of the students of the
	describing current developments and taking up a critical position on them.
	 The students can place a research task in their subject area in its context and describe and critically assess the state research.
Skills	The students are able:
	To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in questic
	 To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and
	incompletely defined problems in a solution-oriented way.
	 To develop new scientific findings in their subject area and subject them to a critical assessment.
Personal Competence	
Social Competence	
	 Dath is writing and arally outline a coincide locus for an expert audience accurately understandably and is a structure.
	 Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structu way.
	 Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the address
	while upholding their own assessments and viewpoints convincingly.
Autonomy	Students are able:
	 To structure a project of their own in work packages and to work them off accordingly.
	• To work their way in depth into a largely unknown subject and to access the information required for them to do so.
	To apply the techniques of scientific work comprehensively in research of their own.
Workload in Hours	Independent Study Time 900, Study Time in Lecture 0
Credit points	30
