Master of Science (M.Sc.) Process Engineering

> Cohort: Winter Term 2023 Updated: 5th August 2024

## **Table of Contents**

Table of Contents	2
Program description	4
Core Qualification Module M0519: Particle Technology and Solid Matter Process Technology	5 5
Module M0523: Business & Management	
Module M0524: Non-technical Courses for Master	8
Module M0540: Transport Processes	10
Module M0541: Process and Plant Engineering II	13
Module M0542: Fluid Mechanics in Process Engineering	15
Module M0895: Advanced Chemical Reaction Engineering	17 21
Module M0896: Bioprocess and Biosystems Engineering Module M0904: Process Design Project	25
Specialization Process Engineering	26
Module M0513: System Aspects of Renewable Energies	20
Module M0874: Wastewater Systems	29
Module M0617: High Pressure Chemical Engineering	32
Module M0875: Nexus Engineering - Water, Soil, Food and Energy	36
Module M0636: Cell and Tissue Engineering	38
Module M0914: Technical Microbiology	40
Module M0714: Numerical Methods for Ordinary Differential Equations	42
Module M1033: Special Areas of Process Engineering and Bioprocess Engineering Module M0721: Air Conditioning	44 48
Module M1702: Process Imaging	
Module M0749: Waste Treatment and Solid Matter Process Technology	52
Module M0952: Industrial Bioprocess Engineering	54
Module M0898: Heterogeneous Catalysis	56
Module M0906: Numerical Simulation and Lagrangian Transport	58
Module M0657: Computational Fluid Dynamics II	61
Module M1737: Power-to-X Process	63
Module M1077: Introduction to model-based industrial process development for biopharmaceuticals	65
Module M1954: Process Simulation and Process Safety Module M1709: Applied optimization in energy and process engineering	67 69
Module M0633: Industrial Process Automation	71
Module M0900: Examples in Solid Process Engineering	73
Module M0949: Rural Development and Resources Oriented Sanitation for different Climate Zones	75
Module M0973: Biocatalysis	77
Module M1017: Food Technology	79
Module M1778: Special Topics on Fluid Mechanics	81
Module M0537: Applied Thermodynamics: Thermodynamic Properties for Industrial Applications	84
Module M0801: Water Resources and -Supply Module M0662: Numerical Mathematics I	86 89
Module M0022: Numerical Matternatics in Module M0075: Industrial Bioprocesses in Practice	91
Module M0802: Membrane Technology	93
Module M1796: Magnetic resonance in engineering	95
Module M0658: Innovative CFD Approaches	97
Module M0742: Thermal Energy Systems	98
Module M1955: Process Intensification in Process Engineering	100
Module M1736: Industrial Homogeneous Catalysis	102
Module M0899: Synthesis and Design of Industrial Processes Module M1354: Advanced Fuels	104 106
Module M1994: Advanced Fuels Module M0905: Research Project Process Engineering	100
Module M0822: Process Modeling in Water Technology	110
Module M1966: Mathematical Image Processing	112
Module M0545: Separation Technologies for Life Sciences	114
Module M2006: Waste Treatment and Recycling	117
Module M2033: Subsurface Processes	119
Module M2019: Nonlinear Model Predictive Control - Theory and Application	121
Specialization Chemical Process Engineering	122
Module M0617: High Pressure Chemical Engineering	122
Module M1702: Process Imaging Module M0714: Numerical Methods for Ordinary Differential Equations	126 128
Module M0952: Industrial Bioprocess Engineering	120
Module M0749: Waste Treatment and Solid Matter Process Technology	132
Module M0898: Heterogeneous Catalysis	134
Module M0906: Numerical Simulation and Lagrangian Transport	136
Module M1709: Applied optimization in energy and process engineering	139
Module M1737: Power-to-X Process	141
Module M1954: Process Simulation and Process Safety	143
Module M0633: Industrial Process Automation Module M0899: Synthesis and Design of Industrial Processes	145 147
Module M0099. Synthesis and Design of Industrial Processes Module M0900: Examples in Solid Process Engineering	147

Module M1033: Special Areas of Process Engineering and Bioprocess Engineering	151
Module M0905: Research Project Process Engineering	155
Module M0975: Industrial Bioprocesses in Practice	156
Module M0537: Applied Thermodynamics: Thermodynamic Properties for Industrial Applications	158
Module M1796: Magnetic resonance in engineering	160
Module M1736: Industrial Homogeneous Catalysis	162
Module M1955: Process Intensification in Process Engineering	164
Module M1354: Advanced Fuels	166
Module M2019: Nonlinear Model Predictive Control - Theory and Application	169
Module M2006: Waste Treatment and Recycling	170
Specialization Environmental Process Engineering	172
Module M0513: System Aspects of Renewable Energies	172
Module M0874: Wastewater Systems	175
Module M0875: Nexus Engineering - Water, Soil, Food and Energy	178
Module M0512: Use of Solar Energy	180
Module M0518: Waste and Energy	184
Module M1702: Process Imaging	186
Module M0749: Waste Treatment and Solid Matter Process Technology	188
Module M0952: Industrial Bioprocess Engineering	190
Module M1308: Modelling and Technical Design of Bio Refinery Processes	192
Module M1287: Risk Management, Hydrogen and Fuel Cell Technology	194
Module M1737: Power-to-X Process	196
Module M1757: Tower to X110cess Module M1878: Sustainable energy from wind and water	198
Module M1954: Process Simulation and Process Safety	201
Module M1888: Environmental protection management	203
Module M0949: Rural Development and Resources Oriented Sanitation for different Climate Zones	204
Module M1033: Special Areas of Process Engineering and Bioprocess Engineering	206
Module M0905: Research Project Process Engineering	210
Module M1294: Bioenergy	211
Module M1303: Energy Projects - Development and Assessment	215
Module M0822: Process Modeling in Water Technology	219
Module M0801: Water Resources and -Supply	221
Module M0802: Membrane Technology	224
Module M0975: Industrial Bioprocesses in Practice	226
Module M1354: Advanced Fuels	228
Module M1796: Magnetic resonance in engineering	231
Module M2003: Biological Waste Treatment	233
Module M2033: Subsurface Processes	235
Module M2019: Nonlinear Model Predictive Control - Theory and Application	237
Module M2006: Waste Treatment and Recycling	238
Thesis	240
Module M-002: Master Thesis	240

### **Program description**

#### Content

#### Learning target

Graduates have acquired in-depth, wide-ranging engineering, mathematical and scientific knowledge that equips them to undertake scientific work and to act responsibly both professionally and in society. They have a critical awareness of more recent findings in their discipline.

Graduates can:

- Analyze problems scientifically and solve them even if they are unusually or incompletely defined and feature competing specifications;
- Abstract and formulate complex problems in a new or developing area;
  Apply innovative methods to solving basic research-oriented problems and develop new scientific methods.

Graduates can:

- Develop concepts and solutions for basic research-oriented, and in some cases unusual, problems, bringing in other disciplines as appropriate;
- Create and develop new products, processes and methods;
- Apply their engineering judgment to work with complex, possibly incomplete information, to identify contradictions and deal with them.

Graduates can:

- Recognize the need for information, find and source information;
- Plan and execute theoretical and experimental investigations;
- · Critically assess data and draw conclusions from it;
- Examine and evaluate the use of new and emerging technologies.

Over and above the qualifications gained on the Bachelor's course, students can:

- Methodically classify and systematically combine knowledge from different fields, and deal with complexity;
- Familiarize themselves systematically and speedily with new tasks;
- Reflect systematically on non-technical impacts of engineering activity and exercise a sense of responsibility in taking them into account in their actions.
- Devise solutions requiring more detailed methodological competence.

The key qualifications for engineering practice acquired on the Bachelor's course are augmented during the Master's course.

## **Core Qualification**

Courses					
Title			Тур	Hrs/wk	СР
Advanced Particle Technology II (LC	0051)		Project-/problem-based Learning	1	1
Advanced Particle Technology II (LC			Lecture	2	2
Experimental Course Particle Techr			Practical Course	3	3
Module Responsible	Prof. Stefan Heinric	h			
Admission Requirements	None				
<b>Recommended Previous</b>	Basic knowledge of	solids processes and partic	le technology		
Knowledge					
Educational Objectives	After taking part su	ccessfully, students have re	ached the following learning results		
Professional Competence					
Knowledge	After completion of the module the students will be able to describe and explain processes for solids processing in detail base		ing in detail based		
	microprocesses on	the particle level.			
Skills	5 Students are able to choose process steps and apparatuses for the focused treatment of solids depending on the s		ding on the spec		
	characteristics. They furthermore are able to adapt these processes and to simulate them.				
Personal Competence					
Social Competence	Students are able to present results from small teamwork projects in an oral presentation and to discuss their knowledge		their knowledge w		
	scientific researche				
Autonomy	Students are able to	o analyze and solve problen	ns regarding solid particles independently or in sr	nall groups.	
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84

Content	<ul> <li>Fluidization</li> <li>Agglomeration</li> <li>Granulation</li> <li>Drying</li> <li>Determination of mechanical properties of agglomerats</li> </ul>
Literature	Schubert, H.; Heidenreich, E.; Liepe, F.; Neeße, T.: Mechanische Verfahrenstechnik. Deutscher Verlag für die Grundstoffindustrie, Leipzig, 1990. Stieß, M.: Mechanische Verfahrenstechnik I und II. Springer Verlag, Berlin, 1992.

Module M0523: Busin	ess & Management
Module Responsible	Prof. Matthias Meyer
Admission Requirements	
<b>Recommended Previous</b>	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	<ul> <li>Students are able to find their way around selected special areas of management within the scope of business manageme</li> <li>Students are able to explain basic theories, categories, and models in selected special areas of business management.</li> <li>Students are able to interrelate technical and management knowledge.</li> </ul>
Skills	<ul> <li>Students are able to apply basic methods in selected areas of business management.</li> <li>Students are able to explain and give reasons for decision proposals on practical issues in areas of business management.</li> </ul>
Personal Competence Social Competence	• Students are able to communicate in small interdisciplinary groups and to jointly develop solutions for complex problems
Autonomy	• Students are capable of acquiring necessary knowledge independently by means of research and preparation of material.
Workload in Hours	Depends on choice of courses
Credit points	

#### Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Module Responsible	Dagmar Richter
	None
<b>Recommended Previous</b>	None
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	The Nontechnical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover Self-reliance, self-management, collaboration and professional and personnel management competences. The depart implements these training objectives in its <b>teaching architecture</b> , in its <b>teaching and learning arrangements</b> , in <b>teac</b> <b>areas</b> and by means of teaching offerings in which students can qualify by opting for <b>specific competences</b> and a <b>compet</b> <b>level</b> at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontech complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontech academic programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual developme competences. It also provides orientation knowledge in the form of "profiles".
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in o two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making transition from school to university and in order to encourage individually planned semesters abroad, there is no obligati study these subjects in one or two specific semesters during the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of de with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliber encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical stu communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the v semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and star in a goal-oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. I differences are reflected in the practical examples used, in content topics that refer to different professional application coni and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leade functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	<ul> <li>explain specialized areas in context of the relevant non-technical disciplines,</li> <li>outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented i learning area,</li> <li>different specialist disciplines relate to their own discipline and differentiate it as well as make connections,</li> <li>sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of represent in the specialized sciences are subject to individual and socio-cultural interpretation and historicity,</li> <li>Can communicate in a foreign language in a manner appropriate to the subject.</li> </ul>
Skills	Professional Competence (Skills)
	<ul> <li>In selected sub-areas students can</li> <li>apply basic and specific methods of the said scientific disciplines,</li> <li>aquestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specific discipline,</li> <li>to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner,</li> <li>justify their decisions on forms of organization and application in practical questions in contexts that go beyond technical relationship to the subject.</li> </ul>

## Personal Competence

Social Competence Personal Competences (Social Skills)

	<ul> <li>Students will be able</li> <li>to learn to collaborate in different manner,</li> <li>to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees,</li> <li>to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen),</li> <li>to explain nontechnical items to auditorium with technical background knowledge.</li> </ul>
Autonomy	Personal Competences (Self-reliance)
	<ul> <li>Students are able in selected areas</li> <li>to reflect on their own profession and professionalism in the context of real-life fields of application</li> <li>to organize themselves and their own learning processes</li> <li>to reflect and decide questions in front of a broad education background</li> <li>to communicate a nontechnical item in a competent way in writen form or verbaly</li> <li>to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)</li> </ul>
	Depends on choice of courses
Credit points	6

## Courses

Information regarding lectures and courses can be found in the corresponding module handbook published separately.

Courses				
Title		Тур	Hrs/wk	СР
Multiphase Flows (L0104)		Lecture	2	2
Reactor Design Using Local Transp	ort Processes (L0105)	Project-/problem-based Learning	2	2
Heat & Mass Transfer in Process En	gineering (L0103)	Lecture	2	2
Module Responsible	Prof. Michael Schlüter			
Admission Requirements	None			
<b>Recommended Previous</b>	All lectures from the undergraduate studies, esp	ecially mathematics, chemistry, thermodynamics	s, fluid mecha	anics, heat- and ma
Knowledge	transfer.			
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence				
Knowledge	Students are able to:			
Skills	<ul> <li>describe transport processes in single- and multiphase flows and they know the analogy between heat- and mass transfer well as the limits of this analogy.</li> <li>explain the main transport laws and their application as well as the limits of application.</li> <li>describe how transport coefficients for heat- and mass transfer can be derived experimentally.</li> <li>compare different multiphase reactors like trickle bed reactors, pipe reactors, stirring tanks and bubble column reactors.</li> <li>are known. The Students are able to perform mass and energy balances for different kind of reactors. Further more t industrial application of multiphase reactors for heat- and mass transfer are known.</li> <li>The students are able to:</li> <li>optimize multiphase reactors by using mass- and energy balances,</li> <li>use transport processes for the design of technical processes,</li> <li>to choose a multiphase reactor for a specific application.</li> </ul>			
Personal Competence				
Social Competence	The students are able to discuss in international	teams in english and develop an approach unde	r pressure of	time.
Autonomy	Students are able to define independently tasks, to solve the problem "design of a multiphase reactor". The knowledge that necessary is worked out by the students themselves on the basis of the existing knowledge from the lecture. The students are ab to decide by themselves what kind of equation and model is applicable to their certain problem. They are able to organize the own team and to define priorities for different tasks.

Course L0105: Reactor Desig	n Using Local Transport Processes
Тур	Project-/problem-based Learning
Hrs/wk	2
CP	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Michael Schlüter
Language	EN
Cycle	WiSe
Content	In this Problem-Based Learning unit the students have to design a multiphase reactor for a fast chemical reaction concerning optimal hydrodynamic conditions of the multiphase flow. The four students in each team have to: • collect and discuss material properties and equations for design from the literature, • calculate the optimal hydrodynamic design, • check the plausibility of the results critically, • write an exposé with the results. This exposé will be used as basis for the discussion within the oral group examen of each team.

Process and Plant Engineering II (LC		Recitation Section (large)	2	2	
Admission Requirements	Prof. Mirko Skiborowski None				
Recommended Previous	unit operation of thermal and mechanical	separation			
Knowledge	chemical reactor engineering				
Educational Objectives	After taking part successfully, students ha	ve reached the following learning results			
Professional Competence	51 5.	5 5			
Knowledge	students can:				
	-present process control concepts of appar	ratus and complex process plants			
	- classifyprocess models and model equations				
	- explain numerical methods and their use in simulation tasks				
	- explain the solving strategy of flowsheet	simulation			
	- explain, present and discuss projects pha	ses within the planning of processes			
	- present and explain the critical path met	hod			
Skills	students are capable of:				
	- formulation of targets of process control	concepts and the translation into industrial praction	e		
	- design and evaluation of process control	concepts and structures			
	- analyse the model structure ans parameters from the process simulation				
	- optimization of calculation sequence with	respect to flowsheet simulation			
Personal Competence					
Social Competence	students are capable of:				
	develop solutions in heterogeneous	small groups			
Autonomy	students are capable of:				
	• taping new knowledge on a special	subject by literature research

Тур	Recitation Section (large)
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Prof. Michael Schlüter
Language	DE
Cycle	WiSe
Content	The Exercise-Lecture will bridge the gap between the theoretical content from the lecture and practical calculations. For this aim a special exercise is calculated at the blackboard that shows how the theoretical knowledge from the lecture can be used to solve real problems in Process Engineering.

Knowledge						
-	After taking part succ	essfully, students have re	eached the followin	g learning results		
Professional Competence						
Knowledge	After completition of t	he module, students are	able to:			
	- identify differences between ideal and non-ideal rectors,					
	- infer fundamental differences in kinetic models for catalyzed reactions,					
	- name modelling algorithms for non-ideal reactors.					
Skills	After successfull completition of the module the students are able to					
	-evaluate properties of non-ideal reactors					
	-compare kinetic modells of heterogeneous-catalyzed reactions and develop measuring techniques thereof					
	-choose instruments for temperature, pressure- concentration and mass-flow measurements regarding process conditions					
	-develop a concept for design of experiments					
Personal Competence						
Social Competence		to analyze scientific cha baches according to scien		rate suitable solutions in sm	all groups. Mored	over they are able
	After successful completition of the lab-course the students have a strong ability to organize themselfes in small groups to solve					
	issues in chemical re their teachers.	action engineering. The	students can disc	uss their subject related kn	owledge among	each other and wi
Autonomy	The students are able to obtain further information for experimental planning and assess their relevance autonomously.

Courses	
<b>Fitle</b> Process Design Project (L1050)	TypHrs/wkCPProjection Course66
Module Responsible	Dozenten des SD V
Admission Requirements	None
Recommended Previous Knowledge	<ul> <li>Particle Technology and Solid Process Engineering</li> <li>Transport Processes</li> <li>Process- and Plant Design II</li> <li>Fluid Mechanics for Process Engineering</li> <li>Chemical Reaction Engineering</li> <li>Bioprocess- and Biosystems-Engineering</li> </ul>
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	After the students passed the project course successfully they know:
	<ul> <li>how a team is working together so solve a complex task in process engineering</li> <li>what kind of tools are necessary to design a process</li> <li>what kind of drawbacks and difficulties are coming up by designing a process</li> </ul>
Skills	<ul> <li>After passing the Module successfully the students are able to:</li> <li>utilize tools for process design for a specific given process engineering task,</li> <li>choose and connect apparatusses for a complete process,</li> <li>collecting all relevant data for an economical and ecological evaluation,</li> <li>optimization of calculation sequence with respect to flowsheet simulation.</li> </ul>
Personal Competence	
Social Competence	The students are able to discuss in international teams in english and develop an approach under pressure of time.
Autonomy	Students are able to define independently tasks, to get new knowledge from existing knowledge as well as to find ways to use knowledge in practice. They are able to organize their own team and to define priorities.

Cycle	WiSe
	In the Process Design Project the students have to design in teams an energy or process engineering plant by calculating and designing single plant components. The calculation of costs as well as the process safety is another important aspect of this course. Furthermore the approval procedures have to be taken into account.

# Specialization Process Engineering

Module M0513: Syste	m Aspects of Renewable Energies				
Courses					
Title		Ту	n	Hrs/wk	СР
Fuel Cells, Batteries, and Gas Storage: New Materials for Energy Production and Storage (L0021)			P cture	2	2
Energy Trading (L0019)			ture	1	1
Energy Trading (L0020)		Re	citation Section (small)	1	1
Deep Geothermal Energy (L0025)		Leo	cture	2	2
Module Responsible	Prof. Martin Kaltschmitt				
Admission Requirements	None				
Recommended Previous	Module: Technical Thermodynamics I				
Knowledge	Module: Technical Thermodynamics II				
Educational Objectives	After taking part successfully, students have reached the f	ollowing l	earning results		
Professional Competence					
Knowledge	Students are able to describe the processes in energy trad	ing and th	ne design of energy markets	and can critica	ally evaluate them in
	relation to current subject specific problems. Furthermore, they are able to explain the basics of thermodynamics or electrochemical energy conversion in fuel cells and can establish and explain the relationship to different types of fuel cells and their respective structure. Students can compare this technology with other energy storage options. In addition, students can give an overview of the procedure and the energetic involvement of deep geothermal energy.			pes of fuel cells and	
Skills	Students can apply the learned knowledge of storage systems for excessive energy to explain for various energy systems different approaches to ensure a secure energy supply. In particular, they can plan and calculate domestic, commercial and industrial heating equipment using energy storage systems in an energy-efficient way and can assess them in relation to complex power systems. In this context, students can assess the potential and limits of geothermal power plants and explain their operating mode.				
	other modules on renewable energy projects. In this conte markets and energy trades.				
Personal Competence					
Social Competence	Students are able to discuss issues in the thematic fields in	the rene	wable energy sector addres	sed within the	module.
Autonomy	Students can independently exploit sources , acquire the particular knowledge about the subject area and transform it to new questions.

Content	Bioeconomy is the production, utilization and conservation of biological resources, including related knowledge, science, technology, and innovation, to provide information products, processes, and services across all economic sectors aiming towards a sustainable biobased technology. In this course the significance of various topics including the production and processing of biomass, economics, logistic as well as management will be discussed. Technologies aiming at the production of renewable biological resources and the conversion of these resources and waste streams into value-added products, such as food, feed, biobased products (textiles, bioplastics, chemicals, pharmaceuticals) and bioenergy will be presented. Biological tools including microorganisms and enzymes will be introduced. This approach with a focus on chemical and process engineering will provide a smooth transition from crude oil-based industry to Sustainable Circular Bioeconomy taking into consideration the environmental issues. This sustainable use of renewable resources for industrial purposes will ensure environmental protection and a long-term balance of social and economic gains.

Content	The industrial application of unit operations as part of process engineering is explained by actual examples of solid biomass
	processes. Size reduction, transportation and dosing, drying and agglomeration of renewable resources are described as important
	unit operations when producing solid fuels and bioethanol, producing and refining edible oils, when making Btl - and WPC -
	products. Aspects of explosion protection and plant design complete the lecture.

	They are able to calculate the minimum airf	flow needed for hygienic conditions in rooms an	d can choose suita	ble filters. They kno
	the basic flow pattern in rooms and are able	e to calculate the air velocity in rooms with the	help of simple me	thods. They know th
	principles to calculate an air duct networ	rk. They know the different possibilities to pro	duce cold and are	e able to draw thes
	processes into suitable thermodynamic diag	grams. They know the criteria for the assessmer	nt of refrigerants.	
Skills	Students are able to configure air condition	systems for buildings and mobile applications	. They are able to	calculate an air du
	network and have the ability to perform sir	mple planning tasks, regarding natural heat so	urces and heat sin	ks. They can transf
	research knowledge into practice. They are	able to perform scientific work in the field of air	conditioning.	
Personal Competence				
Social Competence	In lectures and exercises, the students can	n use many examples and experiments to dis	cuss in small grou	ps in a goal-oriente
	manner, develop a solution and present it.	. Within the exercises, the students can indepe	endently develop f	urther questions ar
	work out targeted solutions.			
Autonomy	Students are able to define tasks independ	lently, to develop the necessary knowledge the	emselves based or	n the knowledge the
	have received, and to use suitable means	for implementation. In the exercises, the stude	ents discuss the m	nethods taught in th
	lectures using complex tasks and critically a	analyze the results.

	The industrial application of unit operations as part of process engineering is explained by actual examples of solid biomass processes. Size reduction, transportation and dosing, drying and agglomeration of renewable resources are described as important unit operations when producing solid fuels and bioethanol, producing and refining edible oils, when making Btl - and WPC - products. Aspects of explosion protection and plant design complete the lecture. Kaltschmitt M., Hartmann H. Content	This course gives an insight into the methodology used in the development of industrial biotechnology processes. Important
	aspects of this are, for example, the development of the fermentation and the work-up steps for the respective target molecule, the
	integration of the partial steps into an overall process, and the cost-effectiveness of the process.

	SoSe
	Heterogeneous Catalysis and Chemical Reaction Engineering are inextricably linked. About 90% of all chemical intermediates a
	consumer products (fuels, plastics, fertilizers etc.) are produced with the aid of catalysts. Most of them, in particular large so
	products, are produced by heterogeneous catalysis viz. gaseous or liquid reactants react on solid catalysts. In multiphase react
	gases, liquids and a solid catalyst are present.
	Heterogeneous catalysis plays also a key role in any future energy scenario (fuel cells, electrocatalytic splitting of water) and
	environmental engineering (automotive catalysis, photocatalyic abatement of water pollutants).
	Heterogeneous catalysis is an interdisciplinary science requiring knowledge of different scientific disciplines such as
	<ul> <li>Materials Science (synthesis and characterization of solid catalysts)</li> <li>Physics (structure and electronic properties of solids, defects)</li> </ul>
	<ul> <li>Physical Chemistry (thermodynamics, reaction mechanisms, chemical kinetics, adsorption, desorption, spectrosco</li> </ul>
	surface chemistry, theory)
	<ul> <li>Reaction Engineering (catalytic reactors, mass- and heat transport in catalytic reactors, multi-scale modeling, application</li> </ul>
	heterogeneous catalysis)
	The class "Modern Methods in Heterogeneous Catalysis" will deal with the above listed aspects of heterogeneous catalysis bey
	the material presented in the normal curriculum of chemical reaction engineering classes. In the corresponding laboratory
	have the opportunity to apply their aquired theoretical knowledge by synthesizing a solid catalyst, characterizing it with a var
	of modern instrumental methods (e.g. BET, chemisorption, pore analysis, XRD, Raman-Spectroscopy, Electron Microscopy)
	measuring its kinetics. Class and laboratory "Modern Methods in Heterogeneous Catalysis" in combination with the lec
	"Analysis and Design of Heterogeneous Catalytic Reactors" will give interested students the opportunity to specialize in
	vibrant, multifaceted and application oriented field of research.

Computational Fluid Dynamics - Ex		Recitation Section (small)	1	1
Computational Fluid Dynamics in P		Lecture	2	2
Module Responsible	Prof. Michael Schlüter			
Admission Requirements				
Recommended Previous				
Knowledge				
	Basic knowledge in Fluid Mechanics			
	<ul> <li>Basic knowledge in chemical thermodynamics</li> </ul>			
Educational Objectives	After taking part successfully, students have reached the	following learning results		
Professional Competence				
Knowledge	After successful completion of the module the students a	re able to		
	- avaiate the the basis principles of statistical therm	dunamica (anacushlas, simple susta	(200	
	<ul> <li>explain the the basic principles of statistical thermodynamics (ensembles, simple systems)</li> <li>describe the main approaches in classical Molecular Modeling (Monte Carlo, Molecular Dynamics) in various ensembles</li> </ul>			
	<ul> <li>discuss examples of computer programs in detail,</li> </ul>	in Modeling (Monte Carlo, Molecular	Dynamics) in var	ious ensembles
	<ul> <li>evaluate the application of numerical simulations,</li> </ul>			
	<ul> <li>list the possible start and boundary conditions for</li> </ul>	a numerical simulation.		
Skills	The students are able to:			
	<ul> <li>set up computer programs for solving simple probl</li> </ul>	ems by Monte Carlo or molecular dy	namics,	
	<ul> <li>solve problems by molecular modeling,</li> </ul>			
	<ul> <li>set up a numerical grid,</li> </ul>			
	<ul> <li>perform a simple numerical simulation with OpenF</li> </ul>	bam,		
	<ul> <li>evaluate the result of a numerical simulation.</li> </ul>			
Personal Competence				
	The students are able to			
	<ul> <li>develop joint solutions in mixed teams and present</li> </ul>			
	<ul> <li>to collaborate in a team and to reflect their own co</li> </ul>	ntribution toward it.		
Autonomy	The students are able to:			
	evaluate their learning progress and to define the	ollowing steps of learning on that ba	asis,	
	<ul> <li>evaluate possible consequences for their profession</li> </ul>	n.		
Workload in Hours	Independent Study Time 110, Study Time in Lecture 70

Тур	Lecture		
Hrs/wk	2		
СР	3		
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28		
Lecturer	Dr. Yan Jin		
Language	EN		
Cycle	SoSe		
Content	Contents		
	- Common variables and terms for characterizing turbulence (energy spectra, energy cascade, etc.)		
	- An overview of Lagrange analysis methods and experiments in fluid mechanics		
	- Critical examination of the concept of turbulence and turbulent structures.		

	-Calculation of the transport of ideal fluid elements and associated analysis methods (absolute and relative diffusion, Lagrangian Coherent Structures, etc.)
	- Implementation of a Runge-Kutta 4th-order in Matlab
	- Introduction to particle integration using ODE solver from Matlab
	- Problems from turbulence research
	- Application analytical methods with Matlab.
	Structure:
	- 14 units a 2x45 min.
	- 10 units lecture
	- 4 Units Matlab Exercise- Go through the exercises Matlab, Peer2Peer? Explain solutions to your colleague
	Learning goals:
	Students receive very specific, in-depth knowledge from modern turbulence research and transport analysis. $ ightarrow$ Knowledge
	The students learn to classify the acquired knowledge, they study approaches to further develop the knowledge themselves and to relate different data sources to each other. $\rightarrow$ Knowledge, skills
	The students are trained in the personal competence to independently delve into and research a scientific topic. $\rightarrow$ Independence
	Matlab exercises in small groups during the lecture and guided Peer2Peer discussion rounds train communication skills in complex situations. The mixture of precise language and intuitive understanding is learnt. $\rightarrow$ Knowledge, social competence
	Required knowledge:
	Fluid mechanics 1 and 2 advantageous
	Programming knowledge advantageous

Courses					
Title		Тур	Hrs/wk	СР	
Computational Fluid Dynamics II (L		Lecture	2	3	
Computational Fluid Dynamics II (L		Recitation Section (large)	2	3	
Module Responsible					
Admission Requirements					
	Students should have sound knowledge of engineering mathematics (series expansions, internal & vector calculus), and be family with the foundations of particulations, differential equations. They about a loss have families with engineering fluid mechanics (series expansions).				
Knowledge	e with the foundations of partial/ordinary differential equations. They should also be familiar with engineering fluid me thermodynamics. Basic knowledge of numerical analysis or computational fluid dynamics is of advantage but not neces				
	thermodynamics. Basic knowledge of humerical		or advantage but	not necessary.	
Educational Objectives	After taking part successfully, students have rea	ched the following learning results			
Professional Competence					
Knowledge	Students will acquire a deeper knowledge of co	mputational fluid dynamics (CFD) and can	translate general	principles of them	
	/fluid engineering into discrete algorithms on differences between different discretisation a convective partial differential equations (PDE)	and approximation concepts for investiga	ting coupled sys	stems of non-line	
	knowledge to develop, code and apply modellin				
	a thorough understanding of details of the theo		-	-	
	and adjust the execution of CFD procedures.				
Skills	The students are able choose and apply appro-		-		
	integrate the governing thermofluid dynamic Pl				
	applications. They acquire the ability to code co				
	codes for parameter investigations and supplem to judge different solution strategies.		an engineering a	narysis. They are a	
	to judge unterent solution strategies.				
Personal Competence					
Social Competence	The students are able to discuss problems, pres		intly develop, imp	lement and report	
	solution strategies that address given technical	reference problems in a team.			
Autonomy	The students can independently analyse nume	erical methods to solving fluid engineering	problems. They	are able to critic	
	analyse own results as well as external data with	n regards to the plausibility and reliability.

Content	In exercise, the contents of the lecture are further deepened and transferred into practical application. This is done using example tasks from practice, which are made available to the students. The students are to solve these tasks independently or in groups with the help of the lecture material. The solution is then discussed with students under scientific guidance, with parts of the task being presented on the blackboard.

Content	In the laboratory practical course, practical experiments on power-to-X processes are carried out. The challenges for the technical implementation of power-to-x processes are made clear to the students. The associated analysis of the test samples is also part of the laboratory practical course and is carried out and evaluated by the students themselves. The results are precisely summarised and scientifically presented in an experimental protocol.

CP	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Mirko Skiborowski
Language	DE/EN
Cycle	SoSe
Content	The lecture offers a general introduction to the basics and possibilities of applied mathematical optimization and deals with application areas on different scales from kinetics identification, optimal design of unit operations to the optimization of entire (sub)processes, and production planning. In addition to the basic classification and formulation of optimization problems, different solution approaches are discussed. Besides deterministic gradient-based methods, metaheuristics such as evolutionary and genetic algorithms and their application are discussed as well.

Biocatalysis and Enzyme Technolog	
Technical Biocatalysis (L1157)	Lecture 2 3
Module Responsible	
Admission Requirements Recommended Previous	
Knowledge	
	After taking part successfully, students have reached the following learning results
Professional Competence	After successful completion of this course, students will be able to
Kilowieuge	
	<ul> <li>reflect a broad knowledge about enzymes and their applications in academia and industry</li> </ul>
	have an overview of relevant biotransformations und name the general definitions
CI-III-	
SKIIIS	After successful completion of this course, students will be able to
	<ul> <li>understand the fundamentals of biocatalysis and enzyme processes and transfer this to new tasks</li> </ul>
	know the several enzyme reactors and the important parameters of enzyme processes
	<ul> <li>use their gained knowledge about the realisation of processes. Transfer this to new tasks</li> <li>analyse and discuss special tasks of processes in plenum and give solutions</li> </ul>
	<ul> <li>analyse and discuss special tasks of processes in prenum and give solutions</li> <li>communicate and discuss in English</li> </ul>
Personal Competence	
Social Competence	After completion of this module, participants will be able to debate technical and biocatalytical questions in small teams enhance the ability to take position to their own opinions and increase their capacity for teamwork.
	ennance the ability to take position to their own opinions and increase their capacity for teamwork.
Autonomy	After completion of this module, participants will be able to solve a technical problem independently including a presentation
	the results.

Content	In the frame of the course the basics of fermentation, fluid processing and process engineering will be repeated.
	Following all aspects of manufacturing of beer will be explained: selection and processing of raw materials, different liquid and solid unit operations, packaging technology and final quality assurance/sensory evaluation. The students will perform all unit operations in pilot scale. The objective is that student experience and adopt a holistic view of food manufacturing.

Course L0311: Chemistry of	Drinking Water Treatment
Тур	Lecture
Hrs/wk	2
CP	1
Workload in Hours	Independent Study Time 2, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	DE
Cycle	WiSe
Content	The topic of this course is water chemistry with respect to drinking water treatment and water distribution
	Major topics are solubility of gases, carbonic acid system and calcium carbonate, blending, softening, redox processes, materials and legal requirements on drinking water treatment. Focus is put on generally accepted rules of technology (DVGW- and DIN- standards). Special emphasis is put on calculations using realistic analysis data (e.g. calculation of pH or calcium carbonate dissolution potential) in exercises. Students can get a feedback and gain extra points for exam by solving problems for homework. Knowledge of drinking water treatment processes is vital for this lecture. Therefore the most important processes are explained coordinated with the course " Water resources management" in the beginning of the semester.

Lecturer	Dr. Wilfried Blümke
Language	EN
Cycle	WiSe
Content	Content of this course is a concrete insight into the principles, processes and structures of an industrial biotechnology company. In addition to practical illustrative examples, aspects beyond the actual process engineering area are also addressed, such as e.g. Sustainability and engineering.

Course L0399: Membrane Te	chnology
Тур	Lecture
Hrs/wk	2
CP	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Prof. Mathias Ernst
Language	EN
Cycle	WiSe
Literature	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis. The functions, advantages and drawbacks of different membrane housings and modules are explained. Students learn how an industrial membrane application is designed in the succession of treatment steps like pre-treatment, water conditioning, membrane integration and post-treatment of water. Besides theory, the students will be provided with knowledge on membrane demo-site examples and insights in industrial practice.

Course L2968: Fundamentals	s of Magnetic Resonance
Тур	Lecture
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	<ul> <li>This lecture covers the fundamentals magnetic resonance imaging (MRI) and magnetic resonance spectroscopy (NMR). It focuses on the following topics:</li> <li>1. The fundamentals of magnetic resonance: magnetism, magnetic fields, radiofrequency, spin, relaxation</li> <li>2. Hardware for magnetic resonance: magnets (high-field and low-field), radiofrequency coil design, magnetic field gradients</li> <li>3. NMR-Spectroscopy: chemical shift, J-Coupling, 2D NMR, solid-state, MAS</li> <li>4. Relaxometry: single-sided NMR, contrasts,</li> <li>5. Magnetic resonance imaging (MRI): gradients, coils, k-space, imaging sequences, ultrafast Imaging, parallel imaging, velocimetry, CEST</li> <li>6. Hyperpolarization techniques: DNP, p-H2, optical pumping with Xe</li> <li>7. Applications of magnetic resonance in material science and engineering</li> <li>8. Applications of magnetic resonance in biomedical engineering</li> </ul>
Literature	<ul> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. ISBN: 978-3-527-60719-8</li> <li>Blümich B., (2003) NMR imaging of materials. Oxford University Press, Online- ISBN: 9780191709524</li> <li>doi: https://doi.org/10.1093/acprof:oso/9780198526766.001.0001</li> <li>Brown R. W., Cheng Y. N., Haacke E. M., Thompson M. Course L2969: Magnetic Res	onance in Engineering
Тур	Project-/problem-based Learning
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	In this course, the theoretical basics of magnetic resonance spectroscopy and magnetic resonance tomography are supplemented with practical experiments on the respective devices. The practical handling and operation of the equipment will be learned.
Literature	<ul> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. ISBN: 978-3-527-60719-8</li> <li>Blümich B., (2003) NMR imaging of materials. 	ods in Research and Development (L0239)	Lecture	2	3
Application of Innovative CFD Meth	ods in Research and Development (L1685)	Recitation Section (small)	2	3
Module Responsible	Prof. Thomas Rung			
Admission Requirements	None			
Recommended Previous	Students should have sound knowledge of engine	5		
Knowledge	with the foundations of partial/ordinary differentia Basic knowledge of numerical analysis or comput- not necessary.		-	-
Educational Objectives	After taking part successfully, students have reac	hed the following learning results		
Professional Competence				
Knowledge	Students will acquire a deeper knowledge of rec particle hydrodynamics and lattice Boltzmann computational fluid mechanics. They are familiar discretisation and approximation concepts for in required knowledge to develop, explain, code a problems with grid and particle based methods, r optimisation.	approaches, and can relate recent inr with the similarities and differences betw ivestigating on the basis of continuum ar nd apply numerical models concepts to a	novations with pr veen different Eule ad kinetic theories approximate multi	esent challenges erian and Lagrangi 5. Students have t phase and multifie
Skills	The students are able choose and apply appropri code computational algorithms dedicated to fini lattice Boltzmann arrangements, apply these cod data for an engineering analysis. They are able to	te volumes on unstructured grids & parti les for parameter investigations and suppl	cle-based discreti ement interfaces	sations & structur
Personal Competence				
Social Competence	The students are able to discuss problems, presense solution strategies that address given technical re- experts.			
Autonomy	The students can independently analyse innova analyse own results as well as external data with perform a simulation-based investigation.

Homogeneous catalysis in applicat	ion (L2804)	Practical Course	1	2
ndustrial homogeneous catalysis (		Lecture	2	2
Industrial homogeneous catalysis (		Recitation Section (large)	1	2
Module Responsible	Prof. Jakob Albert			
Admission Requirements	None			
<b>Recommended Previous</b>				
Knowledge	<ul> <li>Basic knowledge from the Bachelor's</li> </ul>	s degree course in process engineering		
	Chemical reaction engineering			
	<ul> <li>Process and plant engineering</li> </ul>			
Educational Objectives	After taking part successfully, students hav	ve reached the following learning results		
Professional Competence				
Knowledge	Students can:			
	explain the principle of homogeneou			
		plications of homogeneous catalysis in industry		
	<ul> <li>evaluate different nomogeneously ca</li> </ul>	atalysed reactions with regard to their technica	I challenges and eco	nomic significance
Skills	The students are able to			
	- develop concents for the tophylical in	male manufaction of being service used and	ationa	
		nplementation of homogeneously catalysed rea		
		eneous catalysis using laboratory experiments,		
	<ul> <li>apply the acquired knowledge to diff</li> </ul>	ferent homogeneously catalysed reactions.		
Personal Competence				
Social Competence	The students:			
	<ul> <li>are able to work out the practical as</li> </ul>	pects of homogeneous catalysis on the basis of	laboratory ovnorim	onts to carry out a
		ts and to precisely summarise the results of the		
		approaches to solutions and problems in the		
	interdisciplinary small group,			
	are able to work together in small gr	oups on subject-specific tasks,		
	Translated with www.DeepL.com/Tra			
Autonomy	The students			
	are able to independently obtain ext	ensive literature on the topic and to gain know	ledge from it,	
	are able to independently solve task	s on the topic and assess their learning status I	based on the feedba	ck given,
	are able to independently conduct e	xperimental studies on the topic.

Course L2804: Homogeneous	s catalysis in application
Тур	Practical Course
Hrs/wk	1
CP	2
Workload in Hours	Independent Study Time 46, Study Time in Lecture 14
Lecturer	Prof. Jakob Albert
Language	EN
Cycle	WiSe
Content	In the laboratory practical course, practical experiments are carried out with reference to industrial application of homogeneous catalysis. The hurdles to the technical implementation of homogeneously catalysed reactions are made clear to the students. The associated analysis of the experimental samples is also part of the laboratory practical course and is carried out and evaluated by the students themselves. The results are precisely summarised and scientifically presented in an experimental protocol.
Literature	<ol> <li>A. Jess, P. Wasserscheid, "Chemical Technology", Wiley VCH, 2013</li> <li>A. Behr, "Angewandte homogene Katalyse", Wiley-VCH, 2008</li> </ol>

СР	2
Workload in Hours	Independent Study Time 46, Study Time in Lecture 14
Lecturer	Samrin Shaikh, Dr. Maximilian Poller
Language	EN
Cycle	WiSe
Content	In this exercise the contents of the lecture are further deepened and transferred into practical application. This is done using example tasks from practice, which are made available to the students. The students are to solve these tasks independently or in groups with the help of the lecture material. The solution is then discussed with students under scientific guidance, with parts of the task being presented on the blackboard.
Literature	<ol> <li>A. Jess, P. Wasserscheid, "Chemical Technology", Wiley VCH, 2013</li> <li>A. Behr, "Angewandte homogene Katalyse", Wiley-VCH, 2008</li> </ol>

Synthesis and Design of Industrial I	acilities (L1048)	Lecture	1	2
Industrial Plant Design and Econom	ics (L1977)	Project-/problem-based Learning	3	4
Module Responsible	Prof. Mirko Skiborowski			
Admission Requirements	None			
<b>Recommended Previous</b>	process and plant engineering I and II			
Knowledge	thermal separation processes			
	heat and mass transport processes			
	CAPE (absolut necessarily!)			
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence	Arter taking part successfully, students have rea	ched the following learning results		
-	students can:			
	- reproduce the main elements of design of indu	strial processes		
	- give an overview and explain the phases of de	sign		
	- describe and explain energy, mass balances, c	ost estimation methods and economic evaluatior	n of invest pro	jects
	- justify and discuss process control concepts a	nd fundamentals of process optimization		
Skills	students are capable of:			
	-conduction and evaluation of design of unit ope	rations		
	- combination of unit operation to a complex pro	cess plant		
	- use of cost estimation methods for the predicti	on of production costs		
	- carry out the pfd-diagram			
Personal Competence				
-	students are able to discuss and develop in grou	ps the design of an industrial process		
Autonomy	students are able to reflect the consequences of	their professional activity

Research Project in Process Engine	ering (L1051)	Project-/problem-based Learning	6	6
Module Responsible	Dozenten des SD V			
Admission Requirements	None			
<b>Recommended Previous</b>	Advanced state of knowledge in the master program of Proces	ss Engineering		
Knowledge				
Educational Objectives	After taking part successfully, students have reached the follo	wing learning results		
Professional Competence				
Knowledge	Students know current research topics oft institutes engaged in their specialization. They can name the fundamental scient methods used for doing related reserach.			ndamental scienti
Skills	s Students are capable of completing a small, independent sub-project of currently ongoing research projects in the institut engaged in their specialization. Students can justify and explain their approach for problem solving, they can draw conclusio from their results, and then can find new ways and methods for their work. Students are capable of comparing and assessi alterantive approaches with their own with regard to given criteria.			
Personal Competence				
Social Competence	petence Students are able to discuss their work progress with research assistants of the supervising institute. They		hey are capable	
	presenting their results in front of a professional audience.			
Autonomy	Based on their competences gained so far students are capable of defining meaningful tasks within ongoing research project f themselves. They are able to develop the necessary understanding and problem solving methods.			
Workload in Hours	Independent Study Time 96, Study Time in Lecture 84

Course L0314: Process Mode	ling in Drinking Water Treatment
Тур	Project-/problem-based Learning
Hrs/wk	2
СР	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	EN
Cycle	WiSe
	In this course selected drinking water treatment processes (e.g. aeration or activated carbon adsorption) are modeled dynamically using the programming language Modelica, that is increasingly used in industry. In this course OpenModelica is used, an free access frontend of the programming language Modelica. In the beginning of the course the use of OpenModelica is explainded by means of simple examples. Together required elements and structure of the model are developed. The implementation in OpenModelica and the application of the model is done individually or in groups respectively. Students get feedback and can gain extra points for the exam.

Content	The focus is on getting to know the organization and practice of waste management companies. Topics such as planning, financing and logistics will be discussed and there will be an excursion (waste incineration plant, vehicle fleet and collection systems / containers). Project based learning: You will be given a task to work on independently in groups of 4 to 6 students. All tools and data needed for the project work will be discussed in the lecture "Recycling Technologies and Thermal Waste Treatment". Course documents can be downloaded from StudIP. Communication during the project work also takes place via StudIP.

Course L0116: Industrial Pro	cesses Under High Pressure
Тур	Lecture
Hrs/wk	2
СР	2
Workload in Hours	Independent Study Time 32, Study Time in Lecture 28
Lecturer	Dr. Carsten Zetzl
Language	EN
Cycle	SoSe
Content	Part I : Physical Chemistry and Thermodynamics
	1. Introduction: Overview, achieving high pressure, range of parameters.
	2. Influence of pressure on properties of fluids: P,v,T-behaviour, enthalpy, internal energy, entropy, heat capacity, viscosity, thermal conductivity, diffusion coefficients, interfacial tension.
	3. Influence of pressure on heterogeneous equilibria: Phenomenology of phase equilibria
	<ol> <li>Overview on calculation methods for (high pressure) phase equilibria).</li> <li>Influence of pressure on transport processes, heat and mass transfer.</li> </ol>
	Part II : High Pressure Processes
	5. Separation processes at elevated pressures: Absorption, adsorption (pressure swing adsorption), distillation (distillation of air), condensation (liquefaction of gases)
	6. Supercritical fluids as solvents: Gas extraction, cleaning, solvents in reacting systems, dyeing, impregnation, particle formation (formulation)
	7. Reactions at elevated pressures. Influence of elevated pressure on biochemical systems: Resistance against pressure
	Part III : Industrial production
	8. Reaction : Haber-Bosch-process, methanol-synthesis, polymerizations; Hydrations, pyrolysis, hydrocracking; Wet air oxidation, supercritical water oxidation (SCWO)
	9. Separation : Linde Process, De-Caffeination, Petrol and Bio-Refinery
	10. Industrial High Pressure Applications in Biofuel and Biodiesel Production
	11. Sterilization and Enzyme Catalysis
	12. Solids handling in high pressure processes, feeding and removal of solids, transport within the reactor.
	13. Supercritical fluids for materials processing.
	14. Cost Engineering
	Learning Outcomes:
	After a successful completion of this module, the student should be able to
	- understand of the influences of pressure on properties of compounds, phase equilibria, and production processes.
	- Apply high pressure approches in the complex process design tasks
	- Estimate Efficiency of high pressure alternatives with respect to investment and operational costs
	Performance Record: 1. Presence (28 h)
	<ol> <li>Oral presentation of original scientific article (15 min) with written summary</li> </ol>
	3. Written examination and Case study
	( 2+3 : 32 h Workload)
	Workload: 60 hours total

Content	This course gives an insight into the methodology used in the development of industrial biotechnology processes. Important
	aspects of this are, for example, the development of the fermentation and the work-up steps for the respective target molecule, the
	integration of the partial steps into an overall process, and the cost-effectiveness of the process.

Content	Heterogeneous Catalysis and Chemical Reaction Engineering are inextricably linked. About 90% of all chemical intermediates a
	consumer products (fuels, plastics, fertilizers etc.) are produced with the aid of catalysts. Most of them, in particular large so
	products, are produced by heterogeneous catalysis viz. gaseous or liquid reactants react on solid catalysts. In multiphase react
	gases, liquids and a solid catalyst are present.
	Heterogeneous catalysis plays also a key role in any future energy scenario (fuel cells, electrocatalytic splitting of water) and
	environmental engineering (automotive catalysis, photocatalysic abatement of water pollutants).
	Heterogeneous catalysis is an interdisciplinary science requiring knowledge of different scientific disciplines such as
	· Materials Calence (surthesis and sharestarization of calid catalusts)
	Materials Science (synthesis and characterization of solid catalysts)     Develop (structure and electropic properties of calida defects)
	Physics (structure and electronic properties of solids, defects)     Device L Chamietry (thermative reaction reaction reaction)
	<ul> <li>Physical Chemistry (thermodynamics, reaction mechanisms, chemical kinetics, adsorption, desorption, spectrosco surface chemistry, theory)</li> </ul>
	<ul> <li>Reaction Engineering (catalytic reactors, mass- and heat transport in catalytic reactors, multi-scale modeling, application heterogeneous catalysis)</li> </ul>
	The class "Modern Methods in Heterogeneous Catalysis" will deal with the above listed aspects of heterogeneous catalysis beyo
	the material presented in the normal curriculum of chemical reaction engineering classes. In the corresponding laboratory
	have the opportunity to apply their aquired theoretical knowledge by synthesizing a solid catalyst, characterizing it with a var
	of modern instrumental methods (e.g. BET, chemisorption, pore analysis, XRD, Raman-Spectroscopy, Electron Microscopy)
	measuring its kinetics. Class and laboratory "Modern Methods in Heterogeneous Catalysis" in combination with the lect
	"Analysis and Design of Heterogeneous Catalytic Reactors" will give interested students the opportunity to specialize in
	vibrant, multifaceted and application oriented field of research.

Lagrangian transport in turbulent f	lows (I 2301)	<b>Typ</b> Lecture	Hrs/wk 2	<b>CP</b> 3
Computational Fluid Dynamics - Ex		Recitation Section (small)	1	1
Computational Fluid Dynamics in P		Lecture	2	2
Module Responsible	Prof. Michael Schlüter			
Admission Requirements				
Recommended Previous				
Knowledge				
	Basic knowledge in Fluid Mechanics			
	<ul> <li>Basic knowledge in chemical thermodynamics</li> </ul>			
Educational Objectives	After taking part successfully, students have reached the	following learning results		
Professional Competence				
Knowledge	After successful completion of the module the students a	re able to		
	<ul> <li>explain the the basic principles of statistical therm</li> </ul>	advaganica (on complete simple such	(200	
	<ul> <li>describe the main approaches in classical Molecula</li> </ul>			ious onsomblos
	<ul> <li>discuss examples of computer programs in detail,</li> </ul>	in Modeling (Monte Cano, Molecular	Dynamics) in var	ious ensembles
	<ul> <li>evaluate the application of numerical simulations,</li> </ul>			
	<ul> <li>list the possible start and boundary conditions for</li> </ul>	a numerical simulation.		
Skills	The students are able to:			
	<ul> <li>set up computer programs for solving simple prob</li> </ul>	ems by Monte Carlo or molecular dy	namics,	
	<ul> <li>solve problems by molecular modeling,</li> </ul>			
	<ul> <li>set up a numerical grid,</li> </ul>			
	<ul> <li>perform a simple numerical simulation with OpenF</li> </ul>	oam,		
	<ul> <li>evaluate the result of a numerical simulation.</li> </ul>			
Personal Competence				
	The students are able to			
	<ul> <li>develop joint solutions in mixed teams and presen</li> </ul>			
	<ul> <li>to collaborate in a team and to reflect their own co</li> </ul>	ntribution toward it.		
Autonomy	The students are able to:			
	evaluate their learning progress and to define the	following steps of learning on that ba	asis,	
	<ul> <li>evaluate possible consequences for their profession</li> </ul>	n.

Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Yan Jin
Language	EN
Cycle	SoSe
Content	Contents
	- Common variables and terms for characterizing turbulence (energy spectra, energy cascade, etc.)
	- An overview of Lagrange analysis methods and experiments in fluid mechanics
	- Critical examination of the concept of turbulence and turbulent structures.

	-Calculation of the transport of ideal fluid elements and associated analysis methods (absolute and relative diffusion, Lagrangian Coherent Structures, etc.)
	- Implementation of a Runge-Kutta 4th-order in Matlab
	- Introduction to particle integration using ODE solver from Matlab
	- Problems from turbulence research
	- Application analytical methods with Matlab.
	Structure:
	- 14 units a 2x45 min.
	- 10 units lecture
	- 4 Units Matlab Exercise- Go through the exercises Matlab, Peer2Peer? Explain solutions to your colleague
	Learning goals:
	Students receive very specific, in-depth knowledge from modern turbulence research and transport analysis. $\rightarrow$ Knowledge
	The students learn to classify the acquired knowledge, they study approaches to further develop the knowledge themselves and to relate different data sources to each other. $\rightarrow$ Knowledge, skills
	The students are trained in the personal competence to independently delve into and research a scientific topic. $\rightarrow$ Independence
	Matlab exercises in small groups during the lecture and guided Peer2Peer discussion rounds train communication skills in complex situations. The mixture of precise language and intuitive understanding is learnt. → Knowledge, social competence
	Required knowledge:
	Fluid mechanics 1 and 2 advantageous
	Programming knowledge advantageous

Content	The lecture offers a general introduction to the basics and possibilities of applied mathematical optimization and deals with application areas on different scales from kinetics identification, optimal design of unit operations to the optimization of entire (sub)processes, and production planning. In addition to the basic classification and formulation of optimization problems, different solution approaches are discussed. Besides deterministic gradient-based methods, metaheuristics such as evolutionary and genetic algorithms and their application are discussed as well.

Content	In exercise, the contents of the lecture are further deepened and transferred into practical application. This is done using example tasks from practice, which are made available to the students. The students are to solve these tasks independently or in groups with the help of the lecture material. The solution is then discussed with students under scientific guidance, with parts of the task being presented on the blackboard.

Content	In the laboratory practical course, practical experiments on power-to-X processes are carried out. The challenges for the technical implementation of power-to-x processes are made clear to the students. The associated analysis of the test samples is also part of the laboratory practical course and is carried out and evaluated by the students themselves. The results are precisely summarised and scientifically presented in an experimental protocol.

Module Responsible	Prof. Michael Schlüter			
Admission Requirements	None			
<b>Recommended Previous</b>	The students should have passed the Bachelor modules "Process Engineering" successfully.			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the following learning results			
<b>Professional Competence</b>				
Knowledge	Students are able to find their way around selected special areas of Process Engineering within the scope of Process Engineering			
	Students are able to explain technical dependencies and models in selected special areas of Process Engineering.			
			5	5
Skills	Students are able to apply basic methods in selected areas of process engineering.			
Personal Competence				
•				
Social Competence	Students can discuss in English in international teams and work out a solution under time pressure.			
Autonomy	Students can chose independently, in which field the want to deepen their kr	nowledge and skills t	hrough the el	ection of courses.
Workload in Hours	Depends on choice of courses			
Credit points	6

Content	Bioeconomy is the production, utilization and conservation of biological resources, including related knowledge, science,
	technology, and innovation, to provide information products, processes, and services across all economic sectors aiming towards a
	sustainable biobased technology. In this course the significance of various topics including the production and processing of
	biomass, economics, logistic as well as management will be discussed. Technologies aiming at the production of renewable
	biological resources and the conversion of these resources and waste streams into value-added products, such as food, feed, bio-
	based products (textiles, bioplastics, chemicals, pharmaceuticals) and bioenergy will be presented. Biological tools including
	microorganisms and enzymes will be introduced. This approach with a focus on chemical and process engineering will provide a
	smooth transition from crude oil-based industry to Sustainable Circular Bioeconomy taking into consideration the environmental
	issues. This sustainable use of renewable resources for industrial purposes will ensure environmental protection and a long-term
	balance of social and economic gains.

Lecturer	Prof. Raimund Horn	
Language	EN	
Cycle	WiSe	
Content	- Micro kinetics, formal kinetics, molecularity, reaction order, integrated rate laws	
	- Complex reactions, reversible reactions, consecutive reactions, parallel reactions, approximation methods: steady-state, pseudo-	
	first order, numerical solution of rate equations, example : Belousov-Zhabotinskii reaction	
	- Experimental methods of kinetics, integral approach, differential approach, initial rate method, method of half-life, relaxation	
	- experimental methods of kinetics, integral approach, unerential approach, initial face method, method of namine, relaxation methods	
	- Collision theory, Maxwell velocity distribution, collision numbers, line of centers model	
	- Transition state theory, partition functions of atoms and molecules, examples, calculating reaction equilibria on the basis of molecular data only, heats of reaction, calculating rates of reaction by means of statistical thermodynamics	
	<ul> <li>Kinetics of heterogeneous reactions, peculiarities of heterogeneous reactions, mean-field approximation, Langmuir adsorption isotherm, reaction mechanisms, Langmuir-Hinshelwood Mechanism, Eley-Rideal Mechanism, steady-state approximation, quasi-equilibrium approximation, most abundant reaction intermediate (MARI), reaction order, apparent activation energy, example: CO oxidation, transition state theory of surface reactions, Sabatier's principle, sticking coefficient, parameter fitting</li> <li>Explosions, cold flames</li> </ul>

Content	The industrial application of unit operations as part of process engineering is explained by actual examples of solid biomass
	processes. Size reduction, transportation and dosing, drying and agglomeration of renewable resources are described as important
	unit operations when producing solid fuels and bioethanol, producing and refining edible oils, when making Btl - and WPC -
	products. Aspects of explosion protection and plant design complete the lecture.

Research Project in Process Engine	ering (L1051)	Project-/problem-based Learning	6	6
Module Responsible	Dozenten des SD V			
Admission Requirements	None			
<b>Recommended Previous</b>	Advanced state of knowledge in the master program of Process Engineering			
Knowledge				
Educational Objectives	After taking part successfully, students have reached the follo	owing learning results		
Professional Competence				
Knowledge	Students know current research topics oft institutes engaged in their specialization. They can name the fundamental scientif methods used for doing related reserach.			
Skills	Students are capable of completing a small, independent sub-project of currently ongoing research projects in the institute engaged in their specialization. Students can justify and explain their approach for problem solving, they can draw conclusion from their results, and then can find new ways and methods for their work. Students are capable of comparing and assessin alterantive approaches with their own with regard to given criteria.			
Personal Competence				
Social Competence	Students are able to discuss their work progress with res	earch assistants of the supervisin	ig institute. T	hey are capable
	presenting their results in front of a professional audience.			
Autonomy	Based on their competences gained so far students are capable of defining meaningful tasks within ongoing research project for themselves. They are able to develop the necessary understanding and problem solving methods.

Course L2968: Fundamentals	s of Magnetic Resonance
Тур	Lecture
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	<ul> <li>This lecture covers the fundamentals magnetic resonance imaging (MRI) and magnetic resonance spectroscopy (NMR). It focuses on the following topics:</li> <li>1. The fundamentals of magnetic resonance: magnetism, magnetic fields, radiofrequency, spin, relaxation</li> <li>2. Hardware for magnetic resonance: magnets (high-field and low-field), radiofrequency coil design, magnetic field gradients</li> <li>3. NMR-Spectroscopy: chemical shift, J-Coupling, 2D NMR, solid-state, MAS</li> <li>4. Relaxometry: single-sided NMR, contrasts,</li> <li>5. Magnetic resonance imaging (MRI): gradients, coils, k-space, imaging sequences, ultrafast Imaging, parallel imaging, velocimetry, CEST</li> <li>6. Hyperpolarization techniques: DNP, p-H2, optical pumping with Xe</li> <li>7. Applications of magnetic resonance in material science and engineering</li> <li>8. Applications of magnetic resonance in material science and engineering</li> </ul>
Literature	<ol> <li>9. Applications of magnetic resonance in biomedical engineering</li> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. Course L2969: Magnetic Res	onance in Engineering
Тур	Project-/problem-based Learning
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	In this course, the theoretical basics of magnetic resonance spectroscopy and magnetic resonance tomography are supplemented with practical experiments on the respective devices. The practical handling and operation of the equipment will be learned.
Literature	<ul> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. ISBN: 978-3-527-60719-8</li> <li>Blümich B., (2003) NMR imaging of materials. Homogeneous catalysis in applicat	ion (L2804)	Practical Course	1	2
ndustrial homogeneous catalysis (		Lecture	2	2
Industrial homogeneous catalysis (	L2803)	Recitation Section (large)	1	2
Module Responsible	Prof. Jakob Albert			
Admission Requirements	None			
<b>Recommended Previous</b>				
Knowledge	Basic knowledge from the Bachelor's	s degree course in process engineering		
	Chemical reaction engineering			
	<ul> <li>Process and plant engineering</li> </ul>			
Educational Objectives	After taking part successfully, students hav	ve reached the following learning results		
Professional Competence				
Knowledge	Students can:			
	explain the principle of homogeneou			
		plications of homogeneous catalysis in industry		
	<ul> <li>evaluate different nomogeneously ca</li> </ul>	atalysed reactions with regard to their technical	challenges and eco	nomic significance
Skills	The students are able to			
	, develop on each factly to develop it.			
		nplementation of homogeneously catalysed rea	ctions,	
		eneous catalysis using laboratory experiments,		
	<ul> <li>apply the acquired knowledge to diff</li> </ul>	ferent homogeneously catalysed reactions.		
Personal Competence				
Social Competence	The students:			
	<ul> <li>are able to work out the practical as</li> </ul>	pects of homogeneous catalysis on the basis of	laboratory oxporim	onts to carry out a
		ts and to precisely summarise the results of the		
		approaches to solutions and problems in the		
	interdisciplinary small group,			
	are able to work together in small gr	oups on subject-specific tasks,		
	Translated with www.DeepL.com/Tra			
Autonomy	The students			
	<ul> <li>are able to independently obtain ext</li> </ul>	ensive literature on the topic and to gain knowle	edge from it,	
	are able to independently solve task	s on the topic and assess their learning status b	ased on the feedba	ck given,
	are able to independently conduct e	xperimental studies on the topic.

Course L2804: Homogeneous	s catalysis in application
Тур	Practical Course
Hrs/wk	1
CP	2
Workload in Hours	Independent Study Time 46, Study Time in Lecture 14
Lecturer	Prof. Jakob Albert
Language	EN
Cycle	WiSe
Content	In the laboratory practical course, practical experiments are carried out with reference to industrial application of homogeneous catalysis. The hurdles to the technical implementation of homogeneously catalysed reactions are made clear to the students. The associated analysis of the experimental samples is also part of the laboratory practical course and is carried out and evaluated by the students themselves. The results are precisely summarised and scientifically presented in an experimental protocol.

Workload in Hours	Independent Study Time 46, Study Time in Lecture 14
Lecturer	Samrin Shaikh, Dr. Maximilian Poller
Language	EN
Cycle	WiSe
Content	In this exercise the contents of the lecture are further deepened and transferred into practical application. This is done using example tasks from practice, which are made available to the students. The students are to solve these tasks independently or in groups with the help of the lecture material. The solution is then discussed with students under scientific guidance, with parts of the task being presented on the blackboard.

Module Responsible					
Admission Requirements	-				
	-	Process Engineering, Bior	process Engineering or Energy- and Environm	ental Engineering	
Knowledge	Bachelor degree in Process Engineering, Bioprocess Engineering or Energy- and Environmental Engineering				
Educational Objectives	After taking part suc	ccessfully, students have	reached the following learning results		
Professional Competence					
Knowledge	Within the module,	, students learn about d	ifferent provision pathways for the product	ion of advanced fue	els (biofuels like
	alcohol-to-jet; electi	tricity-based fuels like e.¢	g. power-to-liquid). The different processes	chains are explaine	d and the regulat
	framework for susta	ainable fuel production is	examined. This includes, for example, the	requirements of the	Renewable Energ
	Directive II and the	e conditions and aspects	for a market ramp-up of these fuels. For th	e holistic assessme	nt of the various
	options, they are als	so examined under enviro	onmental and economic factors.		
Skills	After successfully pa	articipating, the students	are able to solve simulation and application	asks of renewable e	energy technology
	Module-spann	ining solutions for the desi	ign and presentation of fuel production proce	sses resp. the fuel p	provision chains
	Comprehensi	ive analysis of various fue	l production options in technical, ecological a	ind economic terms	
	Through active disc	cussions of the various t	opics within the lectures and exercises of	the module the st	udants improva t
	-		ical foundations and are thus able to transfer		
Personal Competence					
Social Competence	The students can dis	iscuss scientific tasks in a	subject-specific and interdisciplinary way and	d develop joint solut	ions.
Autonomy	The students are a	able to access independ	lent sources about the questions to be a	dressed and to a	cauire the necess
,	The students are able to access independent sources about the questions to be addressed and to acquire the necknowledge. They are able to assess their respective learning situation concretely in consultation with their supervisor and to further questions and solutions.

Nonlinear Model Predictive Control	- Theory and Application	(L3283)	Lecture		3	6
Nonlinear Model Predictive Control				m-based Learning	2	3
Module Responsible	Prof. Timm Faulwasse	er				
Admission Requirements						
<b>Recommended Previous</b>	Basisc of control engi	neering (stability, simple	control designs), state space mo	odels in control, diff	ferential equa	ations.
Knowledge						
Educational Objectives	After taking part succ	essfully, students have r	eached the following learning res	sults		
Professional Competence						
Knowledge	-		timal control and numerical solu shion, dissipativity notions for op		ign and impl	ementation of mo
	The students are able to formulate and to solve problems of operation and control of technical systems on their own. The students are able to understand and to analyze the interplay of problem formulation and efficiency aspects of numerical solutions and deduce problem-specific formulations. They know how to apply and to implement optimization methods to practical proble Furthermore, the students can tackle complex problems of predictive control by means of abstraction, they are able to docum their results in written form. The students are able to design predictive controllers for nonlinear systems and to validate then means of simulation.					
Personal Competence						
Social Competence	Interaction in interdis	ciplinary teams, meeting	of project deadlines.			
Autonomy	Compare to Fachko	pentenz (Fertigkeiten	)

Content	The focus is on getting to know the organization and practice of waste management companies. Topics such as planning, financing and logistics will be discussed and there will be an excursion (waste incineration plant, vehicle fleet and collection systems / containers). Project based learning: You will be given a task to work on independently in groups of 4 to 6 students. All tools and data needed for the project work will be discussed in the lecture "Recycling Technologies and Thermal Waste Treatment". Course documents can be downloaded from StudIP. Communication during the project work also takes place via StudIP.

## Specialization Environmental Process Engineering

Module M0513: Syste	m Aspects of Renewable Energies			
Courses				
Title		Тур	Hrs/wk	СР
Fuel Cells, Batteries, and Gas Stora	age: New Materials for Energy Production and Storage (L0021)	Lecture	2	2
Energy Trading (L0019)		Lecture	1	1
Energy Trading (L0020)		Recitation Section (small)	1	1
Deep Geothermal Energy (L0025)	Lecture 2 2			2
-	Prof. Martin Kaltschmitt			
Admission Requirements Recommended Previous				
Knowledge	Module. reclinical mernodynamics r			
	Module: Technical Thermodynamics II			
Educational Objectives	After taking part successfully, students have reached the fol	lowing learning results		
Professional Competence				
Knowledge	Students are able to describe the processes in energy tradin	g and the design of energy mar	kets and can critic	ally evaluate them in
	relation to current subject specific problems. Furthermore, they are able to explain the basics of thermodynamics of electrochemical energy conversion in fuel cells and can establish and explain the relationship to different types of fuel cells and their respective structure. Students can compare this technology with other energy storage options. In addition, students can give an overview of the procedure and the energetic involvement of deep geothermal energy.			
Skills	Students can apply the learned knowledge of storage systems for excessive energy to explain for various energy systems different approaches to ensure a secure energy supply. In particular, they can plan and calculate domestic, commercial and industrial heating equipment using energy storage systems in an energy-efficient way and can assess them in relation to complex power systems. In this context, students can assess the potential and limits of geothermal power plants and explain their operating mode.			
	Furthermore, the students are able to explain the procedures and strategies for marketing of energy and apply it in the context of other modules on renewable energy projects. In this context they can unassistedly carry out analysis and evaluations of energie markets and energy trades.			
Personal Competence				
Social Competence	Students are able to discuss issues in the thematic fields in t	he renewable energy sector ad	dressed within the	module.
Autonomy	Students can independently exploit sources , acquire the particular knowledge about the subject area and transform it to new questions.

Module M0512: Use o	f Solar Energy				
Courses					
Title			Тур	Hrs/wk	СР
Energy Meteorology (L0016)			Lecture	1	1
Energy Meteorology (L0017)			Recitation Section (small)	1	1
Collector Technology (L0018)			Lecture	2	2
Solar Power Generation (L0015)			Lecture	2	2
Module Responsible	Prof. Martin Kaltschm	iitt			
Admission Requirements	None				
<b>Recommended Previous</b>	none				
Knowledge					
Educational Objectives	After taking part suce	cessfully, students have re	eached the following learning results		
Professional Competence					
Knowledge	With the completion	of this module, students v	vill be able to deal with technical foundation	s and current issues	and problems in the
	field of solar energy	and explain and evaulate	these critically in consideration of the prio	r curriculum and cu	rrent subject specifi
	issues. In particular	they can professionally	describe the processes within a solar ce	Il and explain the	specific features o
	application of solar n	nodules. Furthermore, the	y can provide an overview of the collector te	chnology in solar th	nermal systems.
	Chudanta ann annlui	he convinced the excitical t		aina aslar radiation	. In this contout fo
SKIIIS			oundations of exemplary energy systems u		
			tial and constraints of solar energy system		
			r energy systems in consideration of technic		
	module-comprehensi	ve knowledge students c	an evalute the economic and ecologic cond	itions of these syste	ems. They can seled
	calculation methods	within the radiation theor	y for these topics.		
Borconal Compotonco					
Personal Competence	Chudanta ara abla ta	diaguag inguag in the them	estis fields in the renewable energy sector a	ddraaad within the	ma a duul a
Social Competence	Students are able to	discuss issues in the then	natic fields in the renewable energy sector a	aaressea witnin the	module.
Autonomy	Students can indepe	ndently exploit sources ar	nd acquire the particular knowledge about th	ne subject area with	respect to emphasi
	fo the lectures. Furt	hermore, with the assist	tance of lecturers, they can discrete use	calculation method	ls for analysing and
	dimensioning solar energy systems. Based on this procedure they can concrete assess their specific learning level and c			arning level and ca	
	consequently define	the further workflow.

	The industrial application of unit operations as part of process engineering is explained by actual examples of solid biomass processes. Size reduction, transportation and dosing, drying and agglomeration of renewable resources are described as important unit operations when producing solid fuels and bioethanol, producing and refining edible oils, when making Btl - and WPC - products. Aspects of explosion protection and plant design complete the lecture. Kaltschmitt M., Hartmann H. Content	This course gives an insight into the methodology used in the development of industrial biotechnology processes. Important
	aspects of this are, for example, the development of the fermentation and the work-up steps for the respective target molecule, the
	integration of the partial steps into an overall process, and the cost-effectiveness of the process.

Content	The lecture provide an insight into the various possibilities of fuel cells in the energy system (electricity, heat and transport). These are presented and discussed for individual fuel types and application-oriented requirements; also compared with alternative technologies in the system. These different possibilities will be presented regardind the state-of-the-art development of the technologies and exemplary applications from Germany and worldwide. Also the emerging trends and lines of development will be discussed. Besides to the technical aspects, which are the focus of the event, also energy, environmental and industrial policy aspects are discussed - also in the context of changing circumstances in the German and international energy system.

Content	In exercise, the contents of the lecture are further deepened and transferred into practical application. This is done using example tasks from practice, which are made available to the students. The students are to solve these tasks independently or in groups with the help of the lecture material. The solution is then discussed with students under scientific guidance, with parts of the task being presented on the blackboard.

Language	DE
Cycle	SoSe
Content	In the laboratory practical course, practical experiments on power-to-X processes are carried out. The challenges for the technical implementation of power-to-x processes are made clear to the students. The associated analysis of the test samples is also part of the laboratory practical course and is carried out and evaluated by the students themselves. The results are precisely summarised and scientifically presented in an experimental protocol.

Content	In the lecture methods for the reduction of emissions from industrial plants are treated. At the beginning a short survey of the different forms of air pollutants is given. In the second part physical principals for the removal of particulate and gaseous pollutants form flue gases are treated. Industrial applications of these principles are demonstrated with examples showing the removal of specific compounds, e.g. sulfur or mercury from flue gases of incinerators.

Content	Bioeconomy is the production, utilization and conservation of biological resources, including related knowledge, science,
	technology, and innovation, to provide information products, processes, and services across all economic sectors aiming towards a
	sustainable biobased technology. In this course the significance of various topics including the production and processing of
	biomass, economics, logistic as well as management will be discussed. Technologies aiming at the production of renewable
	biological resources and the conversion of these resources and waste streams into value-added products, such as food, feed, bio-
	based products (textiles, bioplastics, chemicals, pharmaceuticals) and bioenergy will be presented. Biological tools including
	microorganisms and enzymes will be introduced. This approach with a focus on chemical and process engineering will provide a
	smooth transition from crude oil-based industry to Sustainable Circular Bioeconomy taking into consideration the environmental
	issues. This sustainable use of renewable resources for industrial purposes will ensure environmental protection and a long-term
	balance of social and economic gains.

Content	The industrial application of unit operations as part of process engineering is explained by actual examples of solid biomass
	processes. Size reduction, transportation and dosing, drying and agglomeration of renewable resources are described as important
	unit operations when producing solid fuels and bioethanol, producing and refining edible oils, when making Btl - and WPC -
	products. Aspects of explosion protection and plant design complete the lecture.

Research Project in Process Engine	ering (L1051)	Project-/problem-based Learning	6	6
Module Responsible	Dozenten des SD V			
Admission Requirements	None			
<b>Recommended Previous</b>	Advanced state of knowledge in the master program of Process	Engineering		
Knowledge				
Educational Objectives	After taking part successfully, students have reached the follow	ving learning results		
Professional Competence				
Knowledge	Students know current research topics oft institutes engaged in their specialization. They can name the fundamental scientif methods used for doing related reserach.			
Skills	Students are capable of completing a small, independent sub-project of currently ongoing research projects in the institute engaged in their specialization. Students can justify and explain their approach for problem solving, they can draw conclusion from their results, and then can find new ways and methods for their work. Students are capable of comparing and assessin alterantive approaches with their own with regard to given criteria.			
Personal Competence				
Social Competence	Students are able to discuss their work progress with research	arch assistants of the supervisin	g institute. T	hey are capable
	presenting their results in front of a professional audience.			
Autonomy	Based on their competences gained so far students are capable of defining meaningful tasks within ongoing research project f themselves. They are able to develop the necessary understanding and problem solving methods.

Cycle	WiSe
Content	1) Markets for Agricultural Commodities
	What are the major markets and how are markets functioning
	Recent trends in world production and consumption.
	World trade is growing fast. Logistics. Bottlenecks.
	The major countries with surplus production
	Growing net import requirements, primarily of China, India and many other countries.
	Tariff and non-tariff market barriers. Government interferences.
	2) Closer Analysis of Individual Markets
	Thomas Mielke will analyze in more detail the global vegetable oil markets, primarily palm oil, soya oil,
	rapeseed oil, sunflower oil. Also the raw material (the oilseed) as well as the by-product (oilmeal) will
	be included. The major producers and consumers.
	Vegetable oils and oilmeals are extracted from the oilseed. The importance of vegetable oils and
	animal fats will be highlighted, primarily in the food industry in Europe and worldwide. But in the past
	15 years there have also been rapidly rising global requirements of oils & fats for non-food purposes,
	primarily as a feedstock for biodiesel but also in the chemical industry.
	Importance of oilmeals as an animal feed for the production of livestock and aquaculture
	Oilseed area, yields per hectare as well as production of oilseeds. Analysis of the major oilseeds
	worldwide. The focus will be on soybeans, rapeseed, sunflowerseed, groundnuts and cottonseed.
	Regional differences in productivity. The winners and losers in global agricultural production.
	3) Forecasts: Future Global Demand & Production of Vegetable Oils
	Big challenges in the years ahead: Lack of arable land for the production of oilseeds, grains and other
	crops. Competition with livestock. Lack of water. What are possible solutions? Need for better
	education & management, more mechanization, better seed varieties and better inputs to raise yields.
	The importance of prices and changes in relative prices to solve market imbalances (shortage
	situations as well as surplus situations). How does it work? Time lags.
	Rapidly rising population, primarily the number of people considered "middle class" in the years ahead.
	Higher disposable income will trigger changing diets in favour of vegetable oils and livestock products.
	Urbanization. Today, food consumption per caput is partly still very low in many developing countries,
	primarily in Africa, some regions of Asia and in Central America. What changes are to be expected?
	The myth and the realities of palm oil in the world of today and tomorrow.
	Labour issues curb production growth: Some examples: 1) Shortage of labour in oil palm plantations in
	Malaysia. 2) Structural reforms overdue for the agriculture in India, China and other countries to
	become more productive and successful, thus improving the standard of living of smallholders.

Content	Goal of this course is it to discuss the physical, chemical, and biological as well as the technical, economic, and environmer basics of all options to provide energy from biomass from a German and international point of view. Additionally different syste approaches to use biomass for energy, aspects to integrate bioenergy within the energy system, technical and econor development potentials, and the current and expected future use within the energy system are presented. The course is structured as follows:
	<ul> <li>Biomass as an energy carrier within the energy system; use of biomass in Germany and world-wide, overview on the content of the course</li> <li>Photosynthesis, composition of organic matter, plant production, energy crops, residues, organic waste</li> <li>Biomass provision chains for woody and herbaceous biomass, harvesting and provision, transport, storage, drying</li> <li>Thermo-chemical conversion of solid biofuels</li> </ul>
	<ul> <li>Basics of thermo-chemical conversion</li> <li>Direct thermo-chemical conversion through combustion: combustion technologies for small and large scale un electricity generation technologies, flue gas treatment technologies, ashes and their use</li> <li>Gasification: Gasification technologies, producer gas cleaning technologies, options to use the cleaned producer g for the provision of heat, electricity and/or fuels</li> </ul>
	<ul> <li>Fast and slow pyrolysis: Technologies for the provision of bio-oil and/or for the provision of charcoal, oil clean technologies, options to use the pyrolysis oil and charcoal as an energy carrier as well as a raw material</li> <li>Physical-chemical conversion of biomass containing oils and/or fats: Basics, oil seeds and oil fruits, vegetable oil producti production of a biofuel with standardized characteristics (trans-esterification, hydrogenation, co-processing in exist refineries), options to use this fuel, options to use the residues (i.e. meal, glycerine)</li> <li>Bio-chemical conversion of biomass</li> </ul>
	<ul> <li>Basics of bio-chemical conversion</li> <li>Biogas: Process technologies for plants using agricultural feedstock, sewage sludge (sewage gas), organic wa fraction (landfill gas), technologies for the provision of bio methane, use of the digested slurry</li> <li>Ethanol production: Process technologies for feedstock containing sugar, starch or celluloses, use of ethanol as a full use of the stillage</li> </ul>

	The experiments of the practical lab course illustrate the different aspects of heat generation from biogenic solid fuels. First, different biomasses (e.g. wood, straw or agricultural residues) will be investigated; the focus will be on the calorific value of the biomass. Furthermore, the used biomass will be pelletized, the pellet properties analysed and a combustion test carried out on a pellet combustion system. The gaseous and solid pollutant emissions, especially the particulate matter emissions, are measured and the composition of the particulate matter is investigated in a further experiment. Another focus of the practical course is the consideration of options for the reduction of particulate matter emissions from biomass combustion. In the practical course, a method for particulate matter reduction will be developed and tested. All experiments will be evaluated and the results presented. Within the practical lab course the students discuss different technical-scientific tasks, both subject-specifically and interdisciplinary. They

Knowledge					
Educational Objectives	After taking part successfully, students hav	ve reached the following learning results			
Professional Competence					
Knowledge	By ending this module, students can describe the planning and development of projects using renewable energy so Furthermore they are able to explain the special emphasis on the economic and legal aspects in this context.				
	The learning content of the different topics of the module are use-oriented; thus students can apply them i.a. in professional field of consultation or supervision of energy projects.				
Skills	By ending the module the students can apply the learned theoretical foundations of the development of renewable energy projects to exemplary energy projects and can explain technically and conceptually the resulting correlations with respect to legal a economic requirements.				
	As a basis for the design of renewable energy systems they can calculate the demand for thermal and/or electrical energy operating and regional level. Regarding to this calculation they can choose and dimension possible energy systems.				
	To assess sustainability aspects of renewable energy projects, the students can choose and discuss the right methodolog according to the particular task.				
	Through active discussions of various topics within the seminars and exercises of the module, students improve the understanding and the application of the theoretical background and are thus able to transfer what they have learned in practice				
Personal Competence					
Social Competence	Students will be able to edit scientific tasks in the context of the economic analysis of renewable energy projects in a group with high number of participants and can organize the processing time within the group. They can perform subject-specific a interdisciplinary discussions. Consequently, they can asses the knowledge of their fellow students and are able to deal w feedback on their own performance. Students can present their group results in front of others.				
Autonomy	Regarding to the contents of the lectures and to solve the tasks for the economical analysis of renewable energy projects t students are able to exploit sources and acquire the particular knowledge about the subject area independently and se organized. Based on this expertise they are able to use independently calculation methods for these tasks. Regarding to the calculations, guided by the lecturers, the students can recognize self-organized theri personal level of knowledge.

Content	The lecture "Sustainability Management" gives an insight into the different aspects and dimensions of sustainability. First, essential terms and definitions, significant developments of the last years, and legal framework conditions are explained. The various aspects of sustainability are then presented and discussed in detail. The lecture mainly focuses on concepts for the implementation of the topic sustainability in companies:
	<ul> <li>What is "sustainability"?</li> <li>Why is this concept an important topic for companies?</li> <li>What opportunities and business risks are addressed or are associated with it?</li> <li>How can the often mentioned three pillars of sustainability - economy, ecology, and social- be meaningfully integrated into corporate management despite their sometimes contradictory tendencies, and how a corresponding compromise can be found?</li> <li>What concepts or frameworks exist for the implementation of sustainability management in companies?</li> <li>Which sustainability labels exist for products or companies? What do they have in common, and where do they differ?</li> <li>Furthermore, the lecture is intended to provide insights into the concrete implementation of sustainability aspects into business practice. External lecturers from companies will be invited to report on how sustainability is integrated into their daily processes.</li> <li>In the course of an independently carried out group work, the students will analyze and discuss the implementation of sustainability aspects based on short case studies. By studying and comparing best practice examples, the students will learn about corporate decisions' effects and implications. It should become clear which risks or opportunities are associated if sustainability aspects are taken into account in management decisions.</li> </ul>

Course L0314: Process Mode	ling in Drinking Water Treatment
Тур	Project-/problem-based Learning
Hrs/wk	2
CP	3
Workload in Hours	Independent Study Time 62, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	EN
Cycle	WiSe
Content	In this course selected drinking water treatment processes (e.g. aeration or activated carbon adsorption) are modeled dynamically using the programming language Modelica, that is increasingly used in industry. In this course OpenModelica is used, an free access frontend of the programming language Modelica.
	In the beginning of the course the use of OpenModelica is explainded by means of simple examples. Together required elements and structure of the model are developed. The implementation in OpenModelica and the application of the model is done individually or in groups respectively. Students get feedback and can gain extra points for the exam.

Course L0311: Chemistry of	Drinking Water Treatment
Тур	Lecture
Hrs/wk	2
CP	1
Workload in Hours	Independent Study Time 2, Study Time in Lecture 28
Lecturer	Dr. Klaus Johannsen
Language	DE
Cycle	WiSe
Content	The topic of this course is water chemistry with respect to drinking water treatment and water distribution
	Major topics are solubility of gases, carbonic acid system and calcium carbonate, blending, softening, redox processes, materials and legal requirements on drinking water treatment. Focus is put on generally accepted rules of technology (DVGW- and DIN- standards). Special emphasis is put on calculations using realistic analysis data (e.g. calculation of pH or calcium carbonate dissolution potential) in exercises. Students can get a feedback and gain extra points for exam by solving problems for homework. Knowledge of drinking water treatment processes is vital for this lecture. Therefore the most important processes are explained coordinated with the course " Water resources management" in the beginning of the semester.

Cycle	WiSe
Literature	The lecture on membrane technology supply provides students with a broad understanding of existing membrane treatment processes, encompassing pressure driven membrane processes, membrane application in electrodialyis, pervaporation as well as membrane distillation. The lectures main focus is the industrial production of drinking water like particle separation or desalination; however gas separation processes as well as specific wastewater oriented applications such as membrane bioreactor systems will be discussed as well. Initially, basics in low pressure and high pressure membrane applications are presented (microfiltration, ultrafiltration, nanofiltration, reverse osmosis). Students learn about essential water quality parameter, transport equations and key parameter for pore membrane as well as solution diffusion membrane systems. The lecture sets a specific focus on fouling and scaling issues and provides knowledge on methods how to tackle with these phenomena in real water treatment application. A further part of the lecture deals with the character and manufacturing of different membrane materials and the characterization of membrane material by simple methods and advanced analysis. The functions, advantages and drawbacks of different membrane housings and modules are explained. Students learn how an industrial membrane application is designed in the succession of treatment steps like pre-treatment, water conditioning, membrane integration and post-treatment of water. Besides theory, the students will be provided with knowledge on membrane demo-site examples and insights in industrial practice.

Fundamentals of Magnetic Resonal Magnetic Resonance in Engineering		Lecture Project-/problem-based Learning	3 3	3		
		Floject-/problem-based Learning	5	5		
Module Responsible Admission Requirements	None					
Knowledge	No special previous knowledge is necessary.					
	After taking part successfully, students have reached the	following learning results				
Professional Competence	······	· · · · · · · · · · · · · · · · · · ·				
Knowledge	This module covers the fundamentals of nuclear magnet and their applications in engineering disciplines. The mo learning course that includes practical hands-on experien	odule consists of a classical lecture co	omplemented	by a problem-ba		
Skills	After the successful completion of the course the student 1. Understand the physical principles and practical as 2. Know how to safely operate NMR and MRI systems. 3. Know how to run standard experimental sequences 4. Have an overview of the current capabilities and lin	pects of magnetic resonance in engine and how to implement more advanced	-	otocols.		
Porsonal Compotonco						
Personal Competence	In the problem-based course Magnetic Resonance in Engi	noning the students will obtain band

Course L2968: Fundamentals	s of Magnetic Resonance
Тур	Lecture
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	<ul> <li>This lecture covers the fundamentals magnetic resonance imaging (MRI) and magnetic resonance spectroscopy (NMR). It focuses on the following topics:</li> <li>1. The fundamentals of magnetic resonance: magnetism, magnetic fields, radiofrequency, spin, relaxation</li> <li>2. Hardware for magnetic resonance: magnets (high-field and low-field), radiofrequency coil design, magnetic field gradients</li> <li>3. NMR-Spectroscopy: chemical shift, J-Coupling, 2D NMR, solid-state, MAS</li> <li>4. Relaxometry: single-sided NMR, contrasts,</li> <li>5. Magnetic resonance imaging (MRI): gradients, coils, k-space, imaging sequences, ultrafast Imaging, parallel imaging, velocimetry, CEST</li> <li>6. Hyperpolarization techniques: DNP, p-H2, optical pumping with Xe</li> <li>7. Applications of magnetic resonance in material science and engineering</li> <li>8. Applications of magnetic resonance in material science and engineering</li> </ul>
Literature	<ol> <li>9. Applications of magnetic resonance in biomedical engineering</li> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. Course L2969: Magnetic Res	onance in Engineering
Тур	Project-/problem-based Learning
Hrs/wk	3
CP	3
Workload in Hours	Independent Study Time 48, Study Time in Lecture 42
Lecturer	Dr. Stefan Benders
Language	EN
Cycle	WiSe
Content	In this course, the theoretical basics of magnetic resonance spectroscopy and magnetic resonance tomography are supplemented with practical experiments on the respective devices. The practical handling and operation of the equipment will be learned.
Literature	<ul> <li>Stapf, S., &amp; Han, S. (2006). NMR imaging in chemical engineering. Weinheim: Wiley-VCH. ISBN: 978-3-527-60719-8</li> <li>Blümich B., (2003) NMR imaging of materials. Waste and Environmental Chemist	ry (L0328)		Practical Course		2	2
Biological Waste Treatment (L0318	)		Project-/problem-bas	sed Learning	3	4
Module Responsible	Prof. Kerstin Kuchta					
Admission Requirements	None					
<b>Recommended Previous</b>	chemical and biological l	pasics				
Knowledge						
Educational Objectives	After taking part success	fully, students have reach	ed the following learning results			
Professional Competence						
Knowledge	design and layout of ana	erobic and aerobic waste	ne planning of biological waste tre treatment plants in detail, descrit plain different methods for waste	be different teo		
Skills	The students are able to discuss the compilation of design and layout of plants. They can critically evaluate techniques and qual control measurements. The students can recherché and evaluate literature and date connected to the tasks given in der modu and plan additional tests. They are capable of reflecting and evaluating findings in the group.					
Personal Competence						
	Students can participate	in subject specific and in	tordisciplinary discussions dovo	on cooperator	d colutions ar	d dofond thoir i
Social competence	Ce Students can participate in subject-specific and interdisciplinary discussions, develop cooperated solutions and defend work results in front of others and promote the scientific development in front of colleagues. Furthermore, they ca accept professional constructive criticism.					
Autonomy	are capable, in consultat	tion with supervisors as we hermore, they can define	iterature, business or test report: Il as in the interim presentation, targets for new application-or re	to assess their	r learning leve	el and define fur

Content	The focus is on getting to know the organization and practice of waste management companies. Topics such as planning, financing and logistics will be discussed and there will be an excursion (waste incineration plant, vehicle fleet and collection systems / containers). Project based learning: You will be given a task to work on independently in groups of 4 to 6 students. All tools and data needed for the project work will be discussed in the lecture "Recycling Technologies and Thermal Waste Treatment". Course documents can be downloaded from StudIP. Communication during the project work also takes place via StudIP.

	Thesis	
Module M-002: Maste	r Thesis	
Courses		
Title	Typ Hrs/wk CP	
Module Responsible	Professoren der TUHH	
Admission Requirements	According to General Regulations §21 (1):	
	At least 60 credit points have to be achieved in study programme. The examinations board decides on exceptions.	
<b>Recommended Previous</b>		
Knowledge		
	After taking part successfully, students have reached the following learning results	
Professional Competence		
Knowledge	<ul> <li>The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specializ issues.</li> </ul>	
	• The students can explain in depth the relevant approaches and terminologies in one or more areas of their subje	
	describing current developments and taking up a critical position on them.	
	<ul> <li>The students can place a research task in their subject area in its context and describe and critically assess the state research.</li> </ul>	
Skills	The students are able:	
	<ul> <li>To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in questio</li> <li>To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/</li> </ul>	
	incompletely defined problems in a solution-oriented way.	
	<ul> <li>To develop new scientific findings in their subject area and subject them to a critical assessment.</li> </ul>	
Personal Competence		
Social Competence	Students can	
	Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structur	
	way.	
	Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addresse	
	while upholding their own assessments and viewpoints convincingly.	
Autonomy	Students are able:	
	<ul> <li>To structure a project of their own in work packages and to work them off accordingly.</li> </ul>	
	<ul> <li>To work their way in depth into a largely unknown subject and to access the information required for them to do so.</li> </ul>	
	• To apply the techniques of scientific work comprehensively in research of their own.
