Module M1789: Communication and Negotiation (KTU)	92

Module M1376: Business Models Innovation (KTU)	93
Specialization Value-Driven Technology Business Development (TAU)	95
Module M1815: Analysing and Communicating Value (TAU)	95
Module M1816: Managerial Finance for Sales and Sourcing (TAU)	99
Module M1817: Basics of Industrial Management (TAU)	100
Module M1819: Turning Technology into Business: Commercialization and Business Model Development (TAU)	102
Module M1818: Turning Circular Economy Technologies into Business (TAU)	103
Module M1820: Managing Operative Sales (TAU)	104
Thesis	105
Module M-003: Master Thesis	105

Program description

Content

The MSc. in **Global Technology and Innovation Management & Entrepreneurship (G-TIME)** is a unique 2-year programme offered jointly by a consortium of internationally renowned universities. The consortium consists of following partners: **Aalborg University** (Denmark), **Kaunas University of Technology** (Lithuania), **Manipal University** (India), **Ritsumeikan Asia Pacific University** (Japan), **Hamburg University of Technology** (Germany) and **University of Strathclyde** (Scotland).

The MSc. G-TIME enables graduates of first degrees in engineering, science and technology to successfully manage the innovation process across international boundaries. Students have the opportunity to study at two different universities. The program starts off in Hamburg (Germany) where all students spend the first year (1st & 2nd semester) together. During the second year (3rd & 4th semester) students deepen their G-TIME knowledge at one of the international partner institutions.

Career prospects

Graduates, supported by a network of valuable contacts, enter the international employment market working:

- with enterprises dealing with high end technological products and services
- as consultants making technology assessment and innovation /change management
- with governmental institutes dealing with innovation policy and strategy
- with relevant research and higher education institutions

Learning target

The program equips students with skills to transform research outputs into innovative products and services. Learning the tools and techniques for working globally, students apply this knowledge practically by working on projects with industry contacts in different countries, further enhancing their understanding of international business. G-TIME addresses new challenges in innovative global enterprise and provides:

- A practical and global perspective of Innovation Management, through industry based modules
- Skills applicable for larger multinational organisations to smaller enterprises including start-ups
- Expanded perspectives of Innovation Management including Technology Management, R&D, and Product/Service Development with focus on the interface between disciplines involved in the process:
- Increased research capability focused on activities at the periphery of the innovation process.

Program structure

The programme is fulltime over 24 months and divided into 4 semesters of study. All students take a common first year at Hamburg University of Technology. Depending on their special interests they choose one of the international partner institutions for the second year.

Semesters 1 and 2 at Hamburg University of Technology provide a strong foundation in the field of Technology and Innovation Management. They look at early and late phases of the innovation management process. It concentrates on market research for (radical) innovation, cross functional cooperation at the front end of the innovation process, managing innovation projects over geographical and functional/divisional boarders and preparing the market introduction of new products and services. In addition, they provide a foundation in the field of Entrepreneurship.

The course content of semester 3 (year 2) depends on which partner institution is chosen. Based on their specific core competencies each partner offers courses which complement / deepen the study program of the first year.

In semester 4 all students undertake a thesis project at the institution where they spent the 3rd semester.

Core Qualification

The MSc. in **Global Technology and Innovation Management & Entrepreneurship (G-TIME)** is a unique 2-year programme offered jointly by a consortium of internationally renowned universities. The consortium consists of following partners: **Aalborg University** (Denmark), **Kaunas University of Technology** (Lithuania), **Manipal University** (India), **Ritsumeikan Asia Pacific University** (Japan), **Hamburg University of Technology** (Germany) and **University of Strathclyde** (Scotland).

The MSc. G-TIME enables graduates of first degrees in engineering, science and technology to successfully manage the innovation process across international boundaries. Students have the opportunity to study at two different universities. The program starts off in Hamburg (Germany) where all students spend the first year (1st & 2nd semester) together. During the second year (3rd & 4th semester) students deepen their G-TIME knowledge at one of the international partner institutions.

Cycle	WISE Entrepreneurial finance is at the center of a clash of two very distant worlds: that of entrepreneurship and that of finance. Finance
Content	is disciplined, based on numbers and logical thinking and looking for proven track records. Entrepreneurship is messy, based on intuition and experimentation and treading off the beaten track. Entrepreneurial finance is the provision of funding to young, innovative, growth-oriented companies. Entrepreneurial companies are young, typically less than ten years old, and introduce innovative products or business models. The younger are called "startups," and are typically less than five years old.
	There is a variety of investors who can finance entrepreneurial companies: family and friends, business angels, accelerators and incubators, crowdfunding platforms, venture capital firms, corporate investors, etc. The course provides a thorough understanding of what motivates them, of the way they invest, and of what support they can provide to a company at what stage in the fundraising cycle. The course addresses the following key questions: How much money can and should be raised? When should it be raised and from whom? What is a reasonable valuation of the company? How should funding, employment contracts and exit decisions be structured?
	Thus, the course provides an understanding of the whole fundraising cycle, from the moment the entrepreneur conceived her idea to the moment investors exit the company and move on. We examine the entrepreneur's signalling to investors of the qualities of the venture, the investors' evaluation of the venture, the various dimensions of contracting (cash flow rights, control rights, compensation, and other clauses), the negotiation of a deal and the provision of corporate governance, the process of staged financing, the financing through debt, and the exit process though liquidity events such as initial public offering, sale or merger.
	The following topics will be covered with specific case studies:
	1. Introduction: Evaluating Venture Opportunities
	2. Financial Planning
	3. Ownership and Returns
	4. Valuation Methods
	5. Term Sheets
	6. Structuring Deals
	7. Corporate Governance
	8. Staged Financing
	9. Debt Financing

Content	In addition to the classical lecture approach, case study analyses and the implementation of a business simulation are used.
	This course teaches the relevant elements of strategic business management. It covers various areas of business administratio (e.g. strategic management and aspects of marketing). Upon completion of the course, students should understand different perspectives on the topics and know in which situations which tools can be used and what the limitations of these models/concept are. Students will be able to integrate future strategy and business model concepts into the taxonomy of approaches. The course thus provides an introduction to the most important principles and concepts necessary to understand how companies operate in today's business world. This includes the analysis of an extremely dynamic, increasingly globalizing competitive environment as well as the analysis of the required internal (core) competencies. It also aims to develop analytical skills the facilitate problem-solving and strategic decision-making activities in companies. In addition to the classical lecture approach, case study analyses and the execution of a business simulation are used.

Content	Mindfulness defines a situation, in which a person is mentally present without being distracted from thoughts or emotions. These are neither analyzed nor judged. Mindfulness is an important element of the Buddhist tradition and is taught through mindfulness-based stress reduction (MBSR)-trainings, Yoga, and meditation approaches in western culture. Until today, effects of mindfulness are tested and studied in medical and psychological clinical contexts. However, nowadays it is also part of the new work trend and enters the business context. During the seminar different mindfulness practices are presented, practiced and their effects on creativity, innovation, and entrepreneurship are discussed.

	Globalization of business processes and the revolution in information and communication technologies (ICT) have resulted in					
Content	distributed workflows across geographic boundaries. These developments as well as increased immigration emanating, for example, as a consequence of a shortage of skilled labour in many industrialized nations, have led to the creation of (virtual) multicultural, multi-ethnic teams with diverse cultural backgrounds. Such diversity generally has a positive impact on creativity and innovativeness, as many empirical studies confirm. Nevertheless, varying cultural practices, communication styles, and contextual sensibilities have the potential to disturb or even disrupt collaborative work processes, if left unmanaged.					
	This course focuses on inter-cultural management from both, theoretical as well as practical, points of view to provide a fundament to students enabling them to operate successfully in cross-cultural settings. Case studies and guest lecture(s) we used to provide added practical relevance to the course. In addition, where practicable, student assignments will be used to fautonomous learning.					
	Some of the main topics covered in this course include:					
	Understanding "culture" and its impact on human interaction Verbal and non-verbal communication					
	High and low context communication					
	Role of formality and non-formality in communication					
	Varying interpretations of symbols, rituals & gestures					
	Managing diversity in domestic settings

Content	The purpose of this course is to equip students with important communication skills to successfully navigate the dynamic world of professionals dealing with innovation. Students will explore the field of communication by getting in touch with different communication models, like the Schramm model of communication. Successfully communicating complex ideas in a simple, yet engaging way is key to bring about change in organizations. Here, proficiency with tools like PowerPoint is crucial to create compelling visual support. Also, future change makers need to bring together perspectives in multidisciplinary and increasingly intercultural teams. Being able to give and receive feedback in a constructive way is equally important. Communication will be discussed in these different facets in an interactive format and a focus on practical application.

Content	General description of course content and course goals			
	The aim of the course is to give students an insight into the practice of technology exploitation and innovation marketing. The technologies and product concepts are provided by so called idea providers. These idea providers may be, among others, researchers at universities and project teams working in research institutions with a technical invention or (prospective) entrepreneurs with a business idea. Within the course the student teams will analyze the market potential of technology-based inventions or business ideas. They will define potential target customers in the market. Another important question to answer is, whether the market is still receptive for a given invention, or whether competitors have already exploited the full market potential. Finally, the student teams will also develop first ideas for the design of the marketing mix and write a report that is also handed to the idea providers. Summarizing the most important contents			

The students will find answers to the following fundamental questions:

- What are the key features of the invention?
- What is the unique selling point?
- What is the most attractive application field?
- Who are the target customers?
- What are their needs and how can they be met?
- What is the market potential of innovations?
- What resources are necessary to exploit this market potential?
- How can/should they enter the market?

Professional Competence

Knowledge

Students can...

- understand the process and the tools of market analysis for innovations (e.g. market potential, market growth, market
- explain the concepts of target customers, market definition and market growth
- select the appropriate approach for leading a competitive analysis
- explain the key market-related issues (strengths and weaknesses) of technology-based business opportunities

Skills

Students are capable of...

- analyzing the market potential of inventions and innovative business ideas by using appropriate methods.
- investigating whether a market is still open for a given innovation and develop a first concept for the market entry strategy and the marketing mix.
- searching for relevant information (primary and secondary market data).
- analyzing, aggregating, and interpreting the gathered data and giving well founded recommendations based on the
- writing a scientific report that includes the literature background as well as the development of their methods, their results, conclusions and recommendations

Personal Competence

Social Competence

Students can...

- provide appropriate feedback and handle feedback on their own performance constructively.
- enter into a dialogue with formerly unknown fellow students, participate in discussions, and present well-grounded
- constructively interact with their team members and lead team sessions and group work processes.
- develop joint solutions and come to decisions in mixed teams and present the results to others.

Self-Reliance

Students are able to...

- assess possible consequences of their own decisions.
- define required tasks to find a solution for a given problem.
- make elaborated decisions in an real-world innovation context.
- assess their own performance in a team.

Module M0524: Non-technical Courses for Master		
Module Responsible	Module Responsible Dagmar Richter	
Admission Requirements	None	
Recommended Previous	None	
Knowledge		
Educational Objectives	After taking part successfully, students have reached the following learning results	

Professional Competence

Knowledge The Nontechnical Academic Programms (NTA)

imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fully. Self-reliance, self-management, collaboration and professional and personnel management competences. The department implements these training objectives in its teaching architecture, in its teaching and learning arrangements, in teaching areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competence level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechnical complementary courses.

The Learning Architecture

consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechnical academic programms follow the specific profiling of TUHH degree courses.

The learning architecture demands and trains independent educational planning as regards the individual development of competences. It also provides orientation knowledge in the form of "profiles".

The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one to two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making the transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation to study these subjects in one or two specific semesters during the course of studies.

Teaching and Learning Arrangements

provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of dealing with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberately encouraged in specific courses.

Fields of Teaching

are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, communication studies, migration studies and sustainability research, and from engineering didactics. In addition, from the winter semester 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a goal-oriented way.

The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging goaloriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.

The Competence Level

of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. These differences are reflected in the practical examples used, in content topics that refer to different professional application contexts, and in the higher scientific and theoretical level of abstraction in the B.Sc.

This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leadership functions of Bachelor's and Master's graduates in their future working life.

Specialized Competence (Knowledge)

Students can

- explain specialized areas in context of the relevant non-technical disciplines,
- outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in the learning area,
- different specialist disciplines relate to their own discipline and differentiate it as well as make connections,
- · sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representation in the specialized sciences are subject to individual and socio-cultural interpretation and historicity.
- Can communicate in a foreign language in a manner appropriate to the subject.

Skills Professional Competence (Skills)

In selected sub-areas students can

- apply basic and specific methods of the said scientific disciplines.
- aguestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned specialist
- to handle simple and advanced questions in aforementioned scientific disciplines in a sucsessful manner,
- justify their decisions on forms of organization and application in practical questions in contexts that go beyond the technical relationship to the subject.

Content	The core of this projectseminar is the systematical and method - based development of individual design method skills. The course is divided into two sections: 1.) theoretical input on relevant methodologies and
	2.) practical training and application of innovation methods.
	In the first events, basic knowledge and an overview of methodical approaches to innovation and creativity is given. In the subsequent groupwork phase, user needs are explored, solutions are developed and tested experimentally. Interim results are presented at regular intervals in the plenum. The ideas can be further developed from date to date on the basis of verified or falsified assumptions.
	Different design methodologies will be explained and set in context: Design Thinking, Scrum, Kanban, Simplicity, Appreciative Inquiry, Lean start-up, Business Model Canvas, Value Proposition Design. The didactical concept of the practice phase is problem-based learning. Therefore the methodological training will focus on design thinking applied to a real-world problem. In an iterative manner, the student teams go through all Design Thinking stages in a workshop style - starting from understand, to empathize, define, ideate, prototype and test, several times in projects.
	Agile design methods forster a new working paradim, a mindset of collaboration. The students will experience the connection between methodology and working culture and reflect on their personal development on the one hand and the team dynamics on the other hand.

Content	The course aims to equip students with an understanding of key issues in the management of innovation and an appreciation of the relevant skills needed to manage innovation at both strategic and operational levels. It provides evidence of different approaches based on leading research, real world examples and experiences of firms and organizations from around the world. The management of innovation is one of the most important and challenging aspects of modern organization. Innovation is a fundamental driver of competitiveness and it plays a large part in improving quality of life. Innovation, and particularly technological innovation, is inherently difficult, uncertain and risky, and most new technologies fail to be translated into successful products and services. Given this, it is essential that students understand the strategies, tools and techniques for managing innovation, which often requires a different set of management knowledge and skills from those employed in everyday business administration. The course itself draws upon research activities of the Institute for Technology and Innovation Management at the TUHH (www.tuhh.de/tim) Lecture Topics: • The Management of (Technological) Innovation • Strategy and Organization for Innovation • Managing the Innovation Process • Innovation in the Age of Circular Economy (C2C) • Market-Research for Innovation and Design-thinking • Capturing value from R&D, Open Innovation and IP • Creativity and mindfulness in Innovation

Content	This PBL course is seggregated into two afternoon sessions. This cours aims at enhancing the students' practical skills in (1) forecasting the future development of markets and (2) making appropriate market-related decisions (particularly segmentation,
	managing the marketing mix). The students will be prompted to use the knowledge gathered in the lecture of this module and will be invited to (1) Conduct a scenario analysis for an innovative product category and (2) Engage in decision making within a market simulation game.

Language	EN
Cycle	SoSe
Content	Important note: This course is part of an 6 ECTS module consisting of two courses "Entrepreneurship" & "Creation of Business Opportunities", which have to be taken together in one semester. Startups are temporary, team-based organizations, which can form both within and outside of established companies, to pursue one central objective: taking a new venture idea to market by designing a business model that can be scaled to a full-grown company. In this course, students will form startup teams around self-selected ideas and run through the process just like real startups would do in the first three months of intensive work. Startup Engineering takes an incremental and iterative approach, in that it favors variety and alternatives over one detailed, linear five-year business plan to reach steady state operations. From a problem solving and systems thinking perspective, student teams create different possible versions of a new venture and alternative hypotheses about value creation for customers and value capture vis-à-vis competitors. We will draw on recent scientific findings about international success factors of new venture design. To test critical hypotheses early on, student teams engage in scientific, evidence-based, experimental trial-and-error learning process that measures real progress. Upon completion of this course, students will be able to: Apply a modern innovation toolkit relevant in both the corporate & startup world Analyze given business opportunities in terms of its constituent elements Design new business models by gathering and combining relevant ideas, facts and information Evaluate business opportunities and derive judgment about next steps & decisions Course language is English, but participants can decide to give their graded presentations in German. Students are invited to apply to this course module already with a startup idea and/ or team, but this is not a requirement! We will form teams and ideas in the beginning of the course. Class meetings have alternate intervals of lecture

Specialization Entrepreneurial Business Engineering (AAU)

Business development through technology, innovation and entrepreneurship are the key competencies of the future in the global business arena, both in start-up companies, established private organisations and the public sector knowledge and service organisations. Finding new ways to create value is increasingly a condition for both private and public organisations.

Entrepreneurial Enginnering will teach you how to create, develop, and strengthen a business. You gain insight into methods and processes as well as organisational and management principles in relation to innovation and entrepreneurship in both new and established companies.

Get knowledge of:

- Idea generation, realization, and development
- Methods, processes, and principles for management and organisations to pursue innovation and entrepreneurship
- Business creation and development

Through the core subject of the programme, you specialise in corporate entrepreneurship and design processes, technological innovation management and applied business modeling, financial management and financing for entrepreneurs, marketing, and project management. Based on this, you can in semester projects choose to focus on either starting your own company or work with an already established company.

Through problem-based learning, you develop competencies to identify, analyse and present solutions to current and specific business challenges both individually and in teams. In this way, you build an educational profile that prepares you to take part in complex change processes and develop new solutions.

Content	Both in an existing organisation and as an individual entrepreneur bringing innovative ideas into life requires planning, management, resources, competencies and environments conducive for taking the idea forward. This module provides an understanding of how to pursue opportunities but also on learning and practising this. The module adds an applied dimension to several entrepreneurship topics. While introducing a number of instruments for business planning the module also provides a critical perspective on business planning and on the rationale for promoting entrepreneurship. Moreover, the module introduces some of the most important framework conditions for university-based entrepreneurs. Finally, as 'There is nothing as practical as a good theory' we will also deal with some of the core theoretical issues in entrepreneurship.

Content	Facing intense competition, companies find themselves competing under ever-changing conditions. Those changes force companies to rethink, reorganize and innovate their business offerings and processes as well as change their business model in order to remain competitive. Therefore, management of technological innovation and applied business modelling has become a key challenge for firms. The purpose of the module is to give the students an insight in technological innovation management and applied business modelling, both as a descriptive discipline for existing business, and an innovation discipline for new business. In doing so, this module addresses fundamental issues, and introduces new ideas and theoretical perspectives, both as a descriptive discipline for existing business, and an innovation discipline for new business. We will take a look at the foundations and dynamics of technological innovation and business modelling as well as the implications for firms.		
	This objective includes helping students in attaining better understanding, skills, and competences regarding the role of technology, innovation and change in business as well as the challenges available in, and solutions offered though, organizational transition and change processes. Throughout the module it is emphasised how an organisation, and changes in an organisation, can be understood in relationship with the context of business model innovation as well as technological innovation management. In addition, the module will illustrate ways in which managers could deal with some of these technological innovation and business modelling challenges. Prominence attention is given for providing the students with frameworks and methods that are both theoretically sound and practically useful.

Content	In a rapidly changing world that we live in, it is utmost important for organisations to continuously develop new services, products, and business areas to survive and grow. In terms of creating changes through innovation and business development, established firms face challenges different from those that new firms face. In this module, we aim to understand the role and the processes of corporate entrepreneurship in established firms. We will also explore the external business context - local, national, global networks - that firms are a part of and interacting with, when pursuing innovation and business development. Furthermore, technological aspects of business development and innovation in established companies is explored both in product, process and business model innovation. The module covers both theoretical and practical insights through lectures, discussions and case assignments.

Content	In this module the student will complete collaborative process with a Danish or foreign organisation. This allows students to gain a minimum of 240 hours of valuable work experience while studying. During the collaborative process, students will work on a specific project related to the master programme while working on identifying, exploring, analysing and reflecting on a master programme-related problem of their choice. The purpose of this module is to allow the student to acquire practical experience through working in an organisation with a specific project and bring their knowledge into play by trying out their theoretical and methodological competences in practice. The business cooperation will result in a written report, where the student explicates the knowledge, skills, and competencies acquired during the internship and combine it with contemporary knowledge acquired in the core modules of the master programme. A supervisor will be assigned to the student.

	The objective is that the student after the module possesses the necessary knowledge on:			
	how organisations apply principles from the master programme discipline in practice.			
	practical issues within master programme issues.			
	SKILLS			
	The objective is that the student after the module possesses the necessary skills in:			
	applying relevant knowledge and skills in practice to identify and solve specific master programme - related task in			
	collaboration with external partners.			
	critically thinking and reflecting on practice to connect theory and practice, including how principles from the master			
	programme disciplines can be applied in practice.			
	COMPETENCES			
	The objective is that the student after the module possesses the necessary competences in:			
	converting practical experiences performed during the business cooperation into learning and new knowledge.			
	combining theory and practice to solve master programme-related tasks.

Content	In this module the student will complete collaborative process with a Danish or foreign organisation. This allows students to gain a minimum of 240 hours of valuable work experience while studying. During the collaborative process, students will work on a specific project related to the master programme while working on identifying, exploring, analysing and reflecting on a master programme-related problem of their choice. The purpose of this module is to allow the student to acquire practical experience through working in an organisation with a specific project and bring their knowledge into play by trying out their theoretical and methodological competences in practice. The business cooperation will result in a written report, where the student explicates the knowledge, skills, and competencies acquired during the internship and combine it with contemporary knowledge acquired in the core modules of the master programme. A supervisor will be assigned to the student.

Content	Business - particularly entrepreneurial start-ups working with innovative technologies - has a vital contribution to make to sustainable development. The idea is that entrepreneurial start-ups are a very powerful and agile innovation engine. And this potential for innovation can be used to turn sustainability challenges into opportunities for profits.
	However, and despite their critical importance, new sustainable technologies or even new scientific discoveries and ideas, by themselves, are not sufficient. Generally speaking, unregulated markets are quite inefficient in valuing environmental and social value creation. As a consequence, the rewards for addressing environmental or social problems with novel technologies or solutions are often ambiguous, a fact that makes it difficult to turn sustainable technologies and the products and services based on them in opportunities for profits.
	To be able to reach their full potential to contribute solving sustainability challenges, new technologies as well as the as the products and services developed on them, require to be brought to markets with appropriate business models, namely sustainable business models.
	Designing sustainable business models is not, in itself, easy. First of all it requires to become familiar with the main tools, the governing ideas, and the methods for the design of business. These include, among others, the iterative processes that entrepreneurs and innovators need to diligently manage uncertainty and proceed towards finding scalable and repeatable business models. It also involves understanding what are market-based barriers to sustainability and acquire the knowledge relative to how innovative business models design can support overcoming such barriers.
	Building on these premises, this elective module offers participants to learn how to systematically analyse risks and opportunities related to sustainable technologies, scientific discoveries and ideas that can solve social and environmental problems and how to design sustainable business models for them.

Content	Business design includes an introduction to classic business design concepts with specific focus on developing and implementing business models in existing companies across industries. The student will be introduced to organisational issues through the development and modification of business models and will work with innovation of business models in practice. The point of departure will be new contextual challenges for business design. The development of business models is discussed in relation to existing business context, ecosystems and networks, with focus on the way in which business models develop across organisational boundaries and how this process is supported by collaboration and partnership.

Content	As the role of business becomes increasingly important in the fight against climate change, the module on Sustainability and Non-market Strategy aims to highlight the importance of sustainability in business.
	Students in this module will evaluate 1) the various drivers behind sustainability such as cost savings, growth opportunities, innovation, differentiation, and competitive advantage for motivations that can range from environmental to strategic; 2) how companies respond by integrating sustainability into their strategy, setting goals and standards, as well as different shades of green; and 3) when firms maximize social, environmental, and economic value from solving sustainability issues. Sustainability and Non-market Strategy thus refers to decisions regarding issues of Environment, Social, and Governance issues that firms face, and how firms respond to these challenges.
	This module should be of value for students interested in issues of sustainability, corporate social responsibility, leadership, and corporate strategy for a world adapting to climate change challenges. In order to achieve these goals, the module will cover topics such as UN Sustainable Development Goals, economics of climate change, CSR, greenwashing, leadership in sustainability, emerging technologies, corporate political activity, and role of government. The module aims to develop critical thinking skills that are useful to identify and analyse challenges and opportunities in
	sustainability, as well as become responsible leaders and effective agents of social change. The module will take a strategic approach to understanding sustainability, examine recent research to analyse critical, ethical, and managerial issues in issues of sustainability.

	Managers today need to better understand cause and effect in organisations where data plays an important role in decision-making. While machine learning and AI tools can help with identifying relationships in data, such standard tools often do not detect cause and effect relationships in the data. This creates a shortcoming for managers and strategists where these algorithms may not allow to answer important questions in business analytics and decision making regarding "what is the effect of X on Y?" or "did X cause Y to change?". Many prominent firms such as Google, Uber, Zalando, McKinsey and Spotify are investing in their causal data science capabilities. This module will provide an introduction to the topic of causal inference with a focus on machine learning and AI based problems in business. In this module, students will conceptually learn how to apply causal inference for data and evidence driven decision making, at the intersection of data science and management strategy. Students will be exposed to various examples to apply concepts from causal analyses learnt in the module. The module will first introduce students to the world of causal inference, and cover standard tools that are used in empirical research, such as instrumental variables, regression discontinuity designs, difference-in-differences. The module will also include case studies that cover machine learning and AI based problems in business decisions. As the module will cover these topics conceptually, students do not need a particular background to take this class. However, some concepts such as conditional means, variances, hypothesis testing and regression will be covered at the beginning of the module. In-class lectures feature case studies and examples of causal inference research designs.

	The purpose of this module is to shed light on the social responsibility, compliance, and accountability-control issues that arise in a global business setting. The subject matter is treated as a key for developing critical insight into the world-wide regulatory challenges faced by corporations in implementing environment, social and climate change related reporting obligations, imposed both at the domestic and international level. The module takes the question regarding the practical relevance of three topics - social responsibility, compliance and management control/accountability - in the global context. Firstly, it traces the theories regarding the types and interpretations of corporate social responsibility (CSR), and it illustrates the numerous ways of making sense of it, according to the diverse assumptions about its nature and characteristics. It explores how a range of global emerging social, environmental and political issues impact corporate governance, risk management and strategy policies related to sustainability. Subsequently, it covers the development of the concept of social responsibility and how this is implemented by organizations, what its impact is, and potential future developments. Secondly, the module examines the legal and moral compliance issues and challenges related to these issues are faced by organizations operating in global business contexts. The regulations, standards, and guidance directives that address issues such as environmental compliance, competition, anti-bribery, social responsibility, UN sustainable development goals, ethical leadership and climate change transparency will be considered in this part of the module. Thirdly, the module examines the management control implications. It looks at the definition and interpretation of management control/accountability and at what constitutes the ethic of accountability. In doing so it examines the way social actors (and, to a certain extent, organizations), can situate themselves as members of an ongoing community that aff

Content	The module will guide students through the complete life cycle of a start-up venture from launch to exit. It specifies different
	stages that a new company may go through as it grows, and outlines financial challenges confronting entrepreneurial ventures
	along the way. Students will receive answers to key questions: how much money can and should be raised, what is the optimal
	timing of obtaining financing, what is a reasonable valuation of the venture, how and where to obtain financing, how funding
	should be structured and how to position a new venture strategically. Students will be introduced to knowledge, theories and
	corporate finance tools that will help to recognise venture value, measure and evaluate financial performance.
	This module is designed for students who have a basic understanding of finance and familiar with the concepts such as time value
	of money, basic valuation principles, basic risk and return trade-off fundamentals, basics of evaluation of investment alternatives.
	During the module students will be introduced to approaches to valuing new venture or start-up equity from a venture capital (VC)
	perspective, will learn about various types of investors (venture capital, business angels, private equity, early stage and traditional
	financing sources) and financing of high-risk, high-growth ventures, the optimal timing in terms of obtaining funding and when to
	go public, exit and turnaround strategies, and the impact of digitalisation on entrepreneurial finance market. The module is
	essential for those wishing to understand the financial aspects of entrepreneurship and interested in gaining a broader view of the
	financial landscape and deal structure for new ventures, and for those considering starting a company and raising capital.

Content	The importance of world trade has increased and international business growth offers increased opportunities for organisations. Many organisations are, therefore, now engaged in planning and conducting marketing activities across national borders. This module, introduces students to international marketing and the factors that create international marketing complexity. Also, to the major decisions in international marketing, including whether to go international, what foreign markets to enter, how to enter these markets, and how to design the international marketing mix.

Content	Brands can be extremely valuable assets and a significant growth driver. This module will analyse how brands function as pivotal devices in today's society and the role of strategic brand management in customer value creation. During this module the student will acquire insights into how companies should manage brands to maximize brand equity. This includes knowledge about the different brand management decisions that must be made to build, measure, and manage a brand. Furthermore, the objective of this module is to provide the student with insights into central theories and approaches related to strategic brand management, including theories on how customers develop brand attitudes and behaviours.

Content	The module explores the internationalisation in emerging product and geographic markets. International companies respond to external or internal opportunities and use their creative efforts to introduce new products and services. They, in turn, help capture and retain market share, increase profitability, and achieve competitive advantage in international markets. The module analyses the emergence of products and services, as well as servitization of solutions integrating design and technology. It also explores geographic emerging markets in Asia, Eastern Europe/Russia, Africa and Latin America. It brings cross-country differences in strategies across emerging markets, discusses the effects of internationalization on emerging markets and assesses risks and opportunities in emerging markets and transitional economies.

Content	The module explores the internationalisation of various types of organisational forms such as NGOs, platform organisations, non-for-profit organisations, etc. These forms are not well researched in the International Business literature and offer new avenues for exploring the diversity in internationalisation. The module aims to address the phenomenon of such organisations, cover relevant theories, frameworks, and practices in understanding their internationalisation, their types and relations with established forms of multinational firms. The impact of such organisational forms on society, policy, technology, economy, commerce and the challenges in their international activities and legitimation will be discussed.

Content	This module discusses the emerging trends of value creation such as from do it alone to value co-creation with global partners, establishing cross-border strategic alliances and networks for joint innovation, participating and orchestrating innovation ecosystem for sustainable development, etc. Students will develop knowledge and reflect on issues such as, but not limited to, MNCs' global innovation modes and strategies, business and innovation ecosystems, digital platforms, business ecosystem in emerging markets, and interplay between value co-creation and value capture for sustainable development. During this module, we will start with reflecting more conventional theories and value creation modes such as global value chain and network theory, then will progress to more contemporary theories and topics such as ecosystem theory, coopetition theory, and the impact of digitalization. The module adopts digital tools and employs various pedagogical methods including lecturing, group discussions, peer review and peer learning, games and experiments, simulation, etc.

Content	The objective of the module is to provide the student with theoretical and practical knowledge and abilities within financial control, trade and management of commodities as well as physical and financial exposures within the commodity market and, additionally, to relate to the ethics within the area. The student must develop abilities and skills to understand the market mechanisms in the commodity markets and handle the purchase and sale of commodities, theoretically and practically (simulated). The module is intended to provide the student with the strategic, financial and trading tools needed to handle both day-to-day management and risk management of commodities in practice. As part of this, the student will also get acquainted with the digital tools used to e.g. trade on the energy market, monitor fluctuation in the prices etc. in order to understand the technologies used in the domain, but also to inspire how these could be further developed and challenged.

Specialization Global Design Management (UoS)

The Global Design Management specialisation taught during the second year of the GTIME programme in Glasgow focuses on enabling the systematic role of design in linking creativity to innovation throughout the product development process; from conceptualisation through production and delivery to the market place. The programme aims to develop graduates with management capability who can deploy well-coordinated global product development strategies, operations and projects towards innovation within contemporary industrial settings. Graduates will understand design in innovation as a rigorous engineering process through which innovation can be driven and realised in a competitive global economy, and as a human centred approach that can discover latent societal needs and problems and develop solutions that are sensitive to the needs of all stakeholders.

Different modules introduce the students to key concepts within complex innovative design processes and management approaches, management of globally distributed creative teams at partner universities and the Postgraduate Group Project places student teams to work with an industrial client on a real world solution to client's prioritised brief. Students may integrate and apply design, manufacturing and operations management knowledge and skills to an industry based product and process development project and further develop project management skills. The latter half of the second year at the University of Strathclyde is characterised by the Global Research Project as an individual research project for which the student develops a relevant study topic of interest then executes, documents and presents critical research findings.

These taught and project based modules are supplemented by 2 modules chosen by the students from an approved list of optional modules. These include human centred design, design aesthetics, design methods, sustainable design and remanufacturing, product costing and financial management, quality management and lean six sigma, technology and innovation management, systems thinking, supply chain management and enterprise resource planning.

Specialization Opportunities and Challenges for Innovation Management in New Economic Powerhouses (MU)

Manipal University is synonymous with excellence in higher education. Over 28,000 students from 57 different nations live, learn and play in the sprawling university town. The university has pioneered in every sector, engineering, management, communication and humanities and management, with all its institutes being mapped on the national and international radar. The School of Management, established in 1999, has been shaping professionally competent, socially responsible and ethical management postgraduates. The School draws its strength from its team of dedicated and experienced faculty members. Many of them have industry experience and have commendable record in research and research publication.

The second year of the GTIME program offered by the School, attempts to explore the rapidly changing business landscape in India. It attempts to provide students with a platform to explore this rich developing economy and trace its journey as it emerges into a strong economic power house. The third semester would commence with a one-week cultural immersion program that will sensitize students to the rich cultural heritage of India. This cultural program will also be a birds-eye view of the business culture operational in India. The courses offered in the third semester will provide students with insights into the business models operational in India and changing contours of the business environment. A potent, powerful blend pedagogy consisting of lectures, discussions, on-site visits and case studies will be employed. The project undertaken by the students in the fourth semester will enable them to obtain a hands one experience in an organization where he/she will be able to relate the class room discussions practically.

Specialization Technology and Innovation Management in Japan (APU)

Ritsumeikan University uses the second year of the GTIME program to introduce the students to innovation processes and management approaches used in Japan. Since the global success of Japanese companies, practitioners and scholars around the world have shown an increased interest in and appreciation for Japanese management principles and innovative practices. Japanese companies have for a long time adapted Western ideas of quality and innovation to the Japanese context and introduced new and innovative innovation processes and management techniques. Japan is still a leading driver in the migration toward global operations, integrating design, sourcing, manufacturing and distribution of products and services globally.

The second year in Japan adds to the global character of the master in innovation and technology management. Considering the renowned innovation process of the industry in Japan and the unique innovation processes used in Japan, it is a clear advantage to have focused course- and seminar modules about Japanese product and process innovation conduced in Japan. The students who choose Ritsumeikan University in Japan as their second year destination gain invaluable insights into the Japanese approach to innovation and the international competitiveness that arises from it.

Content	The aim of this course is to demonstrate and discuss the essential role of information technology for innovation and competitive advantage of a company. Innovations of the 21st century such as Apple's iPod - and the competiveness advantage that results from it - are more and more based on information than on physical apparatus. Innovations are embedded in information networks and the value of a physical apparatus is based on how much information is processed or made available through the apparatus. In addition, information technologies are the core for management, manufacturing and service processes. In this sense Information Technology Management is important to accelerate innovations and strengthen competitiveness and, therefore, one of the key parts of Management of Technology (MOT), which is the management to lead R&D to business and add extra value. The course objective is to master "Total Information Technology Management (ITM)". This concepts generally aim at leading R&D and business processes to effectively utilize IT in order to strengthen competitiveness. The course is a complement to the courses "Strategy of Technology (SOT)" and "Management of Technological (MOT)". Why "Information Technology Management"? Paradigm Shift of IT Management IT in the 21st century Smartphone, Big data etc. The Role of Information in innovation Case Study of iPod: Video Case Study The iPod Revolution" E-Business and E-Commerce E-Business and E-Commerce

Specialization Technology Venturing (KTU)

Kaunas University of Technology (KTU) in Lithuania specialises in Technology Venturing during the second year of the GTIME program. Students will gain a broad understanding of the technology venturing process within different size projects and different industrial contexts. All studied topics are pulled together to develop 'right to win' business strategies that are sustainable and differentiated.

The modules at KTU are structured around the following topics: How to initiate technology venturing and develop business model for technology driven business? How to build a successful team for venturing and create a successful start-up? What are the differences between an idea and true opportunity and how to search for promising business opportunities? How to gather the resources necessary to create a great company and leverage venture capital? How to pitch business ideas to investors and manage stakeholder relations? How to assess business value and monitor business growth? What is entrepreneurial leadership in a large company? How to take advantage of doing business within the networks? How to manage corporate intellectual property in order stay competitive in the market? How can organizations fully exploit their potential and capture maximum value for growth and success?

The second-year modules in Kaunas are designed and executed by top academic researchers, and therefore are strongly research oriented. By introducing students to the state-of-the-art in academic research, the aim is to give them necessary tools to properly understand, evaluate and solve real-life cases, and to successfully conduct their final master degree project research.

The problem-based study approach adopted at KTU is intended to disclose a full variety of the problems related to technology venturing that arise in a wide range of different contexts, including: manufacturing, services, small to large organizations and the private and public sectors.

Specialization Value-Driven Technology Business Development (TAU)

At TAU students will have the opportunity to specialise in **Value-Driven Technology Business Development**. Teaching offered in this specialisation integrates technology management, management of sales & finance, and value-creation & communication, complementing the learning content of the first year of the GTIME studies.

The courses offered at TAU will have value creation, value quantification, value communication and value capture as common factors. They will provide solid understanding how organizations create, quantify, communicate and capture value successfully in various contexts and how to apply this knowledge creatively in various organizational contexts.

Content	After this course, students should have a good starting point for working on their Master's Thesis rather independently - in terms				

After this course, students should have a good starting point for working on their Master's Thesis rather independently - in terms of (1) understanding of different empirical data gathering methods, (2) conceptual thinking and (3) empirical research work and its documentation as well as (4) the structure, content and narrative of a thesis. Different managerial concepts, in the end, are tools for both researchers and managers alike to develop their thinking and understanding on complex issues. Students can solve managerial problems in different organizations with the help of the existing literature and are able to reflect the reality using the existing literature and concepts. The student understands how the active work in the field, in the spirit of interventionist research, can be a way to (1) get access to the organization, (2) become a team member, hence (3) providing access to more interesting research data. Naturally, each student will gain expertise in the content area of the paper.

The following shows the learning objectives connected to grading:

After completing this course (Final Grade 1), a student has some idea about the expectations Finnish work environment sets on young business development professionals. The company project is executed with minimal effort and brings no real value to the company. Nevertheless, the student understands the basic idea of constructing the objective and the narrative for an empirical research paper describing the research project and its key findings. The student is able to acquire, evaluate, compare and select information using research literature (and also understand the difference between peer-reviewed material and other sources) related to their empirical project work and research objective as well as provide a summary of the concepts applied in the case.

After completing the course (Final Grade 2), a student knows how to push forward her/his own work, either in the case or writing (though the project management and action plans still mainly rely on the assistant/teacher). The student is able to construct a simple theoretical framework and apply the framework in an empirical project and resulting research paper. In addition, the student invests some effort in developing the company projects, although the results are not yet meaningful. The student writes simple yet understandable English and the paper has an identifiable narrative fulfilling the defined research objectives. The student is also aware of the data gathering methods used in qualitative management research and knows how to document the data gathering process. Similarly, the student is able to follow given instructions to push forward simple development tasks.

After completing the course (Final Grade 3), the student is able to execute an empirical research project with the help of a supervisor; the student is able to actively seek help when needed and also follow the given instructions (with positive attitude),

adding value on top of the advice given. The student is able to build a narrative for a research report with the help of the supervisor and apply the key theoretical concepts appropriately. The company project proceeds well and produces value to the company. The student is able to write simple yet rather flawless English following formatting instructions and reference practices as well as apply the basic tools needed for good cohesion. The student is able to link some empirical findings back to the research literature and the findings are visually connected to the framework built, hence complementing the framework deduced from the theory.

After completing the course (Final Grade 4), the student is able to manage her/his projects independently, seeking advice with good, well-structured questions when needed (with the course material and other evident sources consulted first). The student understands how the active, independent work with the case company makes the managers communicate actively with the student who is now clearly in the driver seat of the project. The student can identify development needs and structure the problem with a conceptual, visual representation as well as propose several potential solutions. The student has developed a habit to report systematically to the supervisors to keep them interested regarding the theoretical work going on. The student knows how to document the theoretical work in a way that feels natural and comfortable to her/himself. The student invests a good amount of effort into the company project, which results in some meaningful findings. The student understands how research interventions are used to 'tease out' theoretically-interesting questions/results with potential for a theory contribution and how to apply that knowledge when building an empirical research setting. The student is also to write professional English with a well-considered narrative, good cohesion, elegant formatting and smart referencing, including almost ready-for-press quality illustrations/visuals.

After completing the course (Final Grade 5), the student is able to execute an empirical research process independently and identify interesting theory contributions on her/his own, though the final argumentation and final visual representations may still need some advice from the supervisors. The student is able to keep both supervisors and company stakeholders interested in the work by good, systematic reporting, engaging the supervisors in the process in a positive way - even when the student needs help, the requests are well structured and the questions show the in-depth understanding of the context as well as the relevant literature. The student knows how to document the interventionist research process and how to show the chain of evidence regarding how the empirical case produced the key findings and the role the intervention played in the process. The student is able to identify findings with theory contribution and position them in the existing literature as well as argue the contribution potential. The student invests a lot of time and effort into the company project, proven by the amount of produced value. The student is able to write academic English in terms of narrative, cohesion, formatting and referencing plus the visuals.

After this course, students should have a good starting point for working on their Master's Thesis rather independently - in terms of (1) understanding of different empirical data gathering methods, (2) conceptual thinking and (3) empirical research work and its documentation as well as (4) the structure, content and narrative of a thesis. Different managerial concepts, in the end, are tools for both researchers and managers alike to develop their thinking and understanding on complex issues. Students can solve managerial problems in different organizations with the help of the existing literature and are able to reflect the reality using the existing literature and concepts. The student understands how the active work in the field, in the spirit of interventionist research, can be a way to (1) get access to the organization, (2) become a team member, hence (3) providing access to more interesting research data. Naturally, each student will gain expertise in the content area of the paper.

The student invests a lot of time and effort into the company project, proven by the amount of produced value. The student is able to write academic English in terms of narrative, cohesion, formatting and referencing plus the visuals.

Literature

Nach Abschluss des Kurses (Abschlussnote 5) ist der/die Studierende in der Lage, selbständig einen empirischen Forschungsprozess durchzuführen und interessante Theoriebeiträge zu identifizieren, auch wenn die abschließende Argumentation und die abschließenden visuellen Darstellungen noch einiger Beratung durch die Betreuer bedürfen. Die/der Studierende ist in der Lage, sowohl die BetreuerInnen als auch die Stakeholder des Unternehmens durch eine gute, systematische Berichterstattung für die Arbeit zu interessieren und die BetreuerInnen auf positive Weise in den Prozess einzubinden - selbst wenn die/der Studierende Hilfe benötigt, sind die Anfragen gut strukturiert und die Fragen zeigen ein tiefgehendes Verständnis des Kontexts sowie der relevanten Literatur. Der/die Studierende weiß, wie er/sie den interventionistischen Forschungsprozess dokumentiert und wie er/sie die Beweiskette aufzeigt, wie der empirische Fall zu den Schlüsselergebnissen führte und welche Rolle die Intervention in diesem Prozess spielte. Der/die Studierende ist in der Lage, Ergebnisse mit Theoriebeitrag zu identifizieren und in der bestehenden Literatur zu positionieren sowie das Beitragspotenzial zu argumentieren. Der/die Studierende investiert viel Zeit und Mühe in das Unternehmensprojekt, was durch den Umfang des produzierten Werts belegt wird. Der/die Studierende ist in der Lage, akademisches Englisch in Bezug auf Erzählung, Kohäsion, Formatierung und Referenzierung sowie visuelle Darstellungen zu schreiben.

Nach diesem Kurs sollten die Studierenden eine gute Ausgangsbasis haben, um ihre Masterarbeit relativ selbstständig zu bearbeiten - in Bezug auf (1) das Verständnis verschiedener Methoden der empirischen Datenerhebung, (2) konzeptionelles Denken und (3) empirische Forschungsarbeit und deren Dokumentation sowie (4) die Struktur, den Inhalt und die Erzählweise einer Arbeit. Die verschiedenen Managementkonzepte sind letztlich Werkzeuge für Forscher und Manager gleichermaßen, um ihr Denken und ihr Verständnis für komplexe Probleme zu entwickeln. Die Studierenden können Managementprobleme in verschiedenen Organisationen mit Hilfe der vorhandenen Literatur lösen und sind in der Lage, die Realität anhand der vorhandenen Literatur und Konzepte zu reflektieren. Der Student versteht, wie die aktive Arbeit vor Ort im Sinne der interventionistischen Forschung ein Weg sein kann, (1) Zugang zur Organisation zu erhalten, (2) ein Teammitglied zu werden und damit (3) Zugang zu interessanteren Forschungsdaten zu erhalten. Natürlich erwirbt jeder Student Fachwissen über den Inhaltsbereich der Arbeit.

Im Folgenden werden die mit der Benotung verbundenen Lernziele dargestellt:

Nach Abschluss dieses Kurses (Abschlussnote 1) hat der Student eine Vorstellung von den Erwartungen, die das finnische Arbeitsumfeld an junge Fachleute im Bereich der Unternehmensentwicklung stellt. Das Unternehmensprojekt wird mit minimalem Aufwand durchgeführt und bringt keinen wirklichen Wert für das Unternehmen. Nichtsdestotrotz versteht der Schüler die Grundidee, die Zielsetzung und den Bericht für eine empirische Forschungsarbeit zu formulieren, die das Forschungsprojekt und seine wichtigsten Ergebnisse beschreibt. Der Student ist in der Lage, Informationen aus der Forschungsliteratur zu beschaffen, zu bewerten, zu vergleichen und auszuwählen (und auch den Unterschied zwischen begutachtetem Material und anderen Quellen zu verstehen), die sich auf seine empirische Projektarbeit und sein Forschungsziel beziehen, sowie eine Zusammenfassung der im Fall angewandten Konzepte zu erstellen.

Nach Beendigung des Kurses (Abschlussnote 2) weiß ein/e Schüler/in, wie er/sie seine/ihre eigene Arbeit vorantreiben kann, entweder im Fall oder schriftlich (obwohl das Projektmanagement und die Aktionspläne immer noch hauptsächlich vom Assistenten/Lehrer abhängen). Der/die Studierende ist in der Lage, einen einfachen theoretischen Rahmen zu konstruieren und diesen in einem empirischen Projekt und einer daraus resultierenden Forschungsarbeit anzuwenden. Darüber hinaus investiert der Studierende einige Anstrengungen in die Entwicklung von Unternehmensprojekten, obwohl die Ergebnisse noch nicht aussagekräftig sind. Der Student schreibt in einfachem, aber verständlichem Englisch und die Arbeit hat eine erkennbare Erzählung, die die definierten Forschungsziele erfüllt. Der Studierende kennt die Methoden der Datenerhebung in der qualitativen Managementforschung und weiß, wie man den Datenerhebungsprozess dokumentiert. Ebenso ist der Studierende in der Lage, vorgegebene Anweisungen zu befolgen, um einfache Entwicklungsaufgaben voranzutreiben.

Nach Abschluss des Kurses (Abschlussnote 3) ist der Studierende in der Lage, ein empirisches Forschungsprojekt mit Hilfe eines Betreuers durchzuführen; er ist in der Lage, bei Bedarf aktiv um Hilfe zu bitten und die gegebenen Anweisungen (mit positiver Einstellung) zu befolgen und den gegebenen Ratschlägen einen Mehrwert hinzuzufügen. Der Studierende ist in der Lage, mit Hilfe des Betreuers eine Darstellung für einen Forschungsbericht zu erstellen und die wichtigsten theoretischen Konzepte angemessen anzuwenden. Das Unternehmensprojekt kommt gut voran und bringt dem Unternehmen einen Mehrwert. Der/die Studierende ist in der Lage, einfache, aber ziemlich fehlerfreie englische Texte zu verfassen, indem er/sie die Formatierungsanweisungen und Referenzpraktiken befolgt und die grundlegenden Werkzeuge anwendet, die für eine gute Kohäsion erforderlich sind. Der Student ist in der Lage, einige empirische Ergebnisse mit der Forschungsliteratur zu verknüpfen, und die Ergebnisse sind visuell mit dem erstellten Rahmen verbunden, wodurch der aus der Theorie abgeleitete Rahmen ergänzt wird.

Nach Abschluss des Kurses (Abschlussnote 4) ist der/die Studierende in der Lage, seine/ihre Projekte selbstständig zu verwalten und bei Bedarf mit guten, gut strukturierten Fragen Rat zu suchen (wobei das Kursmaterial und andere offensichtliche Quellen zuerst konsultiert werden). Der/die Studierende versteht, wie die aktive, selbständige Arbeit mit dem Fallunternehmen die Manager dazu bringt, aktiv mit dem/der Studierenden zu kommunizieren, der/die nun eindeutig auf dem Fahrersitz des Projekts sitzt. Der Student kann den Entwicklungsbedarf identifizieren und das Problem mit einer konzeptionellen, visuellen Darstellung strukturieren sowie mehrere potenzielle Lösungen vorschlagen. Der Student hat sich angewöhnt, seinen Vorgesetzten

Module Manual M.Sc. "Global Technology and Innovation Management & Entrepreneurship"

systematisch Bericht zu erstatten, um deren Interesse an der theoretischen Arbeit aufrechtzuerhalten. Der/die Studierende weiß, wie er/sie die theoretische Arbeit in einer Weise dokumentiert, die ihm/ihr natürlich und angenehm erscheint. Der Student/die Studentin investiert ein gutes Maß an Anstrengung in das Unternehmensprojekt, was zu einigen aussagekräftigen Ergebnissen führt. Die/der Studierende versteht, wie Forschungsinterventionen eingesetzt werden, um theoretisch interessante Fragen/Ergebnisse mit Potenzial für einen Theoriebeitrag herauszuarbeiten, und wie man dieses Wissen beim Aufbau eines empirischen Forschungssettings anwendet. Der Student soll auch einen professionellen englischen Text mit einer gut durchdachten Erzählung, gutem Zusammenhalt, eleganter Formatierung und intelligenter Referenzierung schreiben, einschließlich fast druckreifer Illustrationen/Visualisierungen.

	In business organizations, people are increasingly managed with numbers. Thus, after passing the course (Final grade 1), students are familiar with the basic financial concepts and tools used in the industry and are able to use them in simple contexts. However, in the management field, these concepts and tools must be applied in order to provide the foundation for decision-making. With final grades 2 and 3, students are able to understand how such concepts and tools are used to support management decisions making. In today's knowledge economy, financial information not only is seen as a tool for managing people or organizations. Instead, it is increasingly seen as a source of innovation. Analyzing financial data may, for example, reveal that some customers are willing to pay more of the same product than others, hence helping the company to target its customers better. Understanding of value creation requires that companies are not only able to analyze their own costs but, instead, they also need to analyze the costs of their customers and sometimes even their customer's customers. Similarly, companies are looking for new performance measurement systems or compensation plans to guide the organization to do the right things in order to maximize the value creation and, eventually, outperform the competition. Students passing the course with final grade of 4 and 5 are able to understand the role financial information can play in such business development processes and how financial tools can be applied in innovative ways.

Content	This course sets the stage for management studies and provides a solid foundation for more advanced studies in industrial management. After the course, students understand how technology-driven, industrial-scale operations provide goods and services efficiently to the society while, at the same time, make profit for the owners. Understanding of value creation and it relationship to the success of business organisations forms the cornerstone of the course. Core content
	UNDERSTANDING 2B2 ENVIRONMENT Customer value key to profitable business
	-supply and distribution networks
	-customer value
	-income statement and balance sheet
	-competitive advantage
	-contribution costing
	FROM IDEA TO A PROFITABLE BUSINESS
	Development of offering
	-product life cycle
	-competition
	-money flow in product development
	Bookkeeping
	-principles of double-entry bookkeeping
	-closing and re-opening the books
	-inventory, receivables and payables
	Marketing process
	-segmentation in B2B and B2C contexts

Module Manual M.Sc. "Global Technology and Innovation Management & Entrepreneurship"

Entrepreneursnip"	
	-target market, differentiation and positioning
	-sales process in B2B markets
	SCALING UP THE BUSINESS
	Expanding the business
	-product-market matrix
	-different ways of exporting
	-cost and capital planning
	-venture capital
	Building and managing the organisation
	-developing organisational structure
	-defining systematic processes
	-cost and profit centres
	-full costing
	SUCCESSFUL EXIT
	Business environment in the knowledge economy
	-management and leadership in the future
	-focus on core competencies and outsourcing
	-knowledge-intensive services and gamification
	-successful exit
	Complementary knowledge
	evaluating/quantifying customer value in practice
	estimating payback period of a new process innovation in practice
	3D printing as a communication tool in product development
	segmentation in B2B markets in practice
	challenges related to starting exports in practice
	building management reporting system and dashboards for KPIs in practice
Literature	cultural differences in management and leadership

Content	The students will understand strategies and issues in commercializing circular economy technologies and technological products and services. The students investigate the design, analysis and utilization of business models and commercialization process models. Different tools, such as canvases and models, are applied for bridging technological innovation to customer needs and potential markets (commercialization process models, Business Model Canvas, Value proposition canvas, Impact Canvas). Special emphasis will be devoted to how institutions and regulations shape the business potential of circular economy technologies. The lessons learnt will cover strategic decision-making and tactics related to managing, financing and marketing technologies, acknowledging the different paths of turning circular economy technologies into business.

Cycle	WiSe
Content	The students will understand strategies and issues in commercializing circular economy technologies and technological products
	and services. The students investigate the design, analysis and utilization of business models and commercialization process
	models. Different tools, such as canvases and models, are applied for bridging technological innovation to customer needs and
	potential markets (commercialization process models, Business Model Canvas, Value proposition canvas, Impact Canvas). Special
	emphasis will be devoted to how institutions and regulations shape the business potential of circular economy technologies. The
	lessons learnt will cover strategic decision-making and tactics related to managing, financing and marketing technologies,
	acknowledging the different paths of turning circular economy technologies into business.

Content	The objective of the course is to understand the nature of operative sales in B2B markets and the key concepts used for business development in global B2B networks. After the course students understand the key characteristics of B2B markets and operative sales processes. Furthermore, students are familiar with the basic concepts and tools used in the planning, management and improvement of the operative sales processes in B2B context. Guest lecturers will be used to illustrate what development of B2B sales practices and processes mean in practice. In addition, the student papers used as course material will provide an opportunity for 'peer learning' since those papers have been written by first year master's students majoring in International Sales and Sourcing; the papers will illustrate how some 'peers with similar background' have applied business concepts and tools in their practical business development projects. To support business development in business networks, the course also includes elements of financial and management accounting, focusing on concepts relevant to sales professionals with the special emphasis on value creation and value capture. Thus, after the course students are able to apply contribution and full costing in simple pricing situations. The students also understand basic principles how business potential of a new offering or a new market can be quantified and are able to use that knowledge in the budgeting process. Finally, the students are able to apply financial key ratios to analyze income statement and balance sheet in order to evaluate and prioritize existing and potential customers. Selling technology-intensive products and services requires close collaboration with customers in order to help customers solve complex problems, making sales professionals almost consultants. To support that, the course also contains exercise on face-to-face sales negotiation to enable students to evaluate their current communication skills and potential areas of improvement. Thus, after the cou

Knowledge	
	After taking part successfully, students have reached the following learning results
Professional Competence Knowledge	 The students can use specialized knowledge (facts, theories, and methods) of their subject competently on specialized issues. The students can explain in depth the relevant approaches and terminologies in one or more areas of their subject, describing current developments and taking up a critical position on them. The students can place a research task in their subject area in its context and describe and critically assess the state of research.
Skills	 The students are able: To select, apply and, if necessary, develop further methods that are suitable for solving the specialized problem in question. To apply knowledge they have acquired and methods they have learnt in the course of their studies to complex and/or incompletely defined problems in a solution-oriented way. To develop new scientific findings in their subject area and subject them to a critical assessment.
Personal Competence	
Social Competence	Students can
	 Both in writing and orally outline a scientific issue for an expert audience accurately, understandably and in a structured way. Deal with issues competently in an expert discussion and answer them in a manner that is appropriate to the addressees while upholding their own assessments and viewpoints convincingly.
Autonomy	Students are able:
	 To structure a project of their own in work packages and to work them off accordingly. To work their way in depth into a largely unknown subject and to access the information required for them to do so. To apply the techniques of scientific work comprehensively in research of their own.
