Module M0831: Introduction to Operations Research and Statistics	40
Module M1261: Management	43
Module M1735: Ethics and Technology	44
Module M0681: Project Course Logistics and Mobility	45
Module M1704: Gamification of Strategic Thinking	46
Module M0622: Business Administration and Enterprise Resource Planning: CERMEDES AG	47
Module M1675: Legal Foundations of Logistics and Mobility	49
Module M0974: Business Simulation Marktstrat	50
Specialization Information Technology	52
Module M1693: Computer Science for Engineers - Programming Concepts, Data Handling & Communication Module M1290: Simulation of intra logistics	52 54
Module M1290. Simulation of Intra logistics Module M0852: Graph Theory and Optimization	56
Module M1680: Automation in logistics	58
Module M0833: Introduction to Control Systems	59
Module M1593: Data Mining	62
Module M1289: Logistical systems - Industry 4.0	63
Module M1423: Algorithms and Data Structures	65
Module M1592: Statistics	67
Module M0853: Mathematics III	69
Module M1070: Simulation of Transport and Handling Systems	72
Module M1349: Object-oriented programming in logistics Module M1679: Process Management	74 75
Module M1079. Process Management Module M0980: Logistics, Transport and Environment	76
Module M1595: Machine Learning	78
Module M0727: Stochastics	80
Specialization Production Management and Processes	82
Module M0865: Fundamentals of Production and Quality Management	82
Module M1679: Process Management	84
Module M0725: Production Engineering	85
Module M1680: Automation in logistics	88
Module M0608: Basics of Electrical Engineering	89
Module M0933: Fundamentals of Materials Science	91
Module M0853: Mathematics III Module M0055: Macagurament Tachnology for Machanical Engineers	93
Module M0956: Measurement Technology for Mechanical Engineers Module M1013: Traffic systems and handling technology	96 99
Module M0833: Introduction to Control Systems	101
Module M1112: Production Logistics	101
Module M1289: Logistical systems - Industry 4.0	105
Module M0610: Electrical Machines and Actuators	107
Module M0980: Logistics, Transport and Environment	109
Module M1290: Simulation of intra logistics	111
Module M1014: Logistics Service Provider Management	113
Specialization Traffic Planning and Systems	115
Module M0986: Introduction to Transportation Economics	115
Module M0983: Mobility Concepts Module M1013: Traffic systems and handling technology	116
Module M1013: Traffic systems and handling technology Module M0608: Basics of Electrical Engineering	118 120
Modulo M0740: Structural Analysis L	120
Module M0740. Structural Analysis i Module M0853: Mathematics III	124
Module M0728: Hydromechanics and Hydrology	127
Module M1289: Logistical systems - Industry 4.0	130

Module M0706: Geotechnics I	132
Module M0833: Introduction to Control Systems	134
Module M1070: Simulation of Transport and Handling Systems	137
Module M0852: Graph Theory and Optimization	139
Module M0536: Fundamentals of Fluid Mechanics	141
Module M0767: Aeronautical Systems	143
Module M1633: Planning Law and Environmental Law/ Sustainable Urban Development	145
Module M1014: Logistics Service Provider Management	146
Module M0610: Electrical Machines and Actuators	148
Module M0985: Introduction to Railways	150
Module M0980: Logistics, Transport and Environment	152
Module M0671: Technical Thermodynamics I	154
Thesis	156
Module M-001: Bachelor Thesis	156

Program description

Content

Economic development with its rapid change in products and processes has also led, among other things, to a considerable restructuring of the intercompany division of labor. Today, this division of labor is characterized by cross-company value chains in which complex production processes have to be planned, sustainably designed and controlled. Logistics and its basic functions, transport, handling and warehousing, play a central role in this. Mobility is understood in the sense of social participation and opportunities for movement. Successful, socially and ecologically compatible economic activity under such conditions is made possible by the interaction of innovative technical systems, information and communication technologies, and management strategies.

The bachelor's degree program "Engineering and Management - Major in Logistics and Mobility" prepares graduates for professional activities in this interdisciplinary field. Extensive, interdisciplinary basic knowledge from the natural and engineering sciences and from business administration is taught. The effects on society as a whole are always included. By working on a wide range of tasks from various application areas of logistics and mobility, students also learn how to deal with specific issues, thus acquiring a meaningful mix of practical and scientific skills.

Career prospects

Graduates of the program can enter directly into professions in the field of logistics or transportation planning. The degree program prepares them for independent and joint activities in responsible positions.

Possible employers include, for example, companies in the logistics sector, trading companies, manufacturing companies, engineering and planning offices, transport companies, construction companies, infrastructure operators and the public sector.

At Hamburg University of Technology, graduates have the opportunity, among other things, to follow the bachelor's degree program in "Engineering and Management - Major in Logistics and Mobility" with a master's degree in "Logistics, Infrastructure, and Mobility" or in "International Management and Engineering".

Learning target

The bachelor's degree program in "Engineering and Management - Major in Logistics and Mobility" prepares students both for a professional career and for a relevant master's degree program. The basic methodological knowledge required for this is acquired during the course of study. The learning outcomes of the program are achieved through an interplay of basic and advanced modules from the fields of logistics, engineering and business administration and can be specialized in one of three specializations. The learning objectives are divided below into the categories of knowledge, skills, social competence and independence.

Knowledge

Knowledge is constituted by facts, principles and theories and is acquired in the Bachelor's program "Engineering and Management - Major in Logistics and Mobility" in the following areas:

- 1. Graduates are able to explain the basic methods, procedures and interrelationships of engineering sciences, in particular mathematics, engineering mechanics and computer science.
- Graduates will be able to explain the basic methods, procedures and interrelationships of economics, business administration and management.
 Graduates will be able to explain the methods, procedures and interrelationships of logistics and transportation planning and provide an overview of their subject and the interrelationships between the sub-disciplines of logistics.
- Graduates are able to place their subject in the overall societal, social and economic context.

Skills

The ability to apply acquired knowledge in order to solve specific problems is supported in many ways in the degree program "Engineering and Management - Major in Logistics and Mobility":

- 1. Graduates are able to solve technical problems, as well as design new technical systems of logistics and transportation systems.
- 2. Graduates are able to evaluate technical systems of logistics and transport systems economically and ecologically.
- 3. Graduates are able to analyze, plan, design and control the flow systems (goods, people, information, money) necessary for the production of goods or the provision of services and to apply their theoretical knowledge in practical problems. Due to their holistic and analytical thinking, graduates are also able to penetrate and optimize networked processes.

Social competence

Social competence comprises the individual ability and willingness to work together with others in a goal-oriented manner, to understand the interests of others, to communicate and to help shape the working and living environment.

- 1. Graduates can integrate themselves into professionally homogeneous teams, organize themselves in these teams, take on specific subtasks and reflect on their own contribution.
- 2. Graduates are able to integrate themselves into heterogeneous teams, to organize themselves in these teams, to take on specific subtasks and to reflect on their own contribution.
- 3. Graduates are able to communicate about the contents of logistics and mobility as well as the results of their own work in an appropriate manner with both experts and laypersons.
- 4. Graduates are able to classify the social and ecological effects of logistics and transport systems on society and the environment.

Self-reliance

Personal competencies include not only the competence to act independently, but also the system and solution competencies to represent general problems as specific sub-problems as well as the selection and mastery of suitable methods and procedures for problem solving.

- 1. Graduates are able to realistically assess their competencies and work on deficits independently.
- 2. Graduates have the ability to formulate their findings precisely in writing and orally.
- Graduates are able to independently work on sub-projects in more complex logistics and transport planning projects on the basis of the knowledge and skills they have acquired during their studies.
- 4. Graduates can reliably apply methods of scientific work and are thus also qualified to work in research or to deepen their competencies in a more advanced course of study.

Program structure

The curriculum of the Bachelor's degree program "Engineering and Management - Major in Logistics and Mobility" is structured as follows:

- Core qualification, 19 compulsory modules, 3 compulsory elective modules, 132 LP, 1st-5th semester.
- Consolidation, 3 compulsory modules, 3 compulsory elective modules, 36 LP, 4th semester onwards
- Bachelor thesis, 12 LP, 6th semester

This results in a total of 180 LP.

In the core qualification, students are taught the fundamentals of mathematics, engineering, business administration, logistics and mobility, primarily in the first four semesters. In addition, there is a compulsory elective module in applied business administration, a freely selectable technical and a freely selectable non-technical supplementary module. A student research project in the fifth semester prepares students for their final thesis.

Starting in the 4th semester, students choose one of the three specializations:

- Transport planning and systemsProduction management and processesInformation Technology

A specialization consists of three compulsory modules and three elective modules.

The fifth semester is kept as free as possible due to the high number of elective modules. This makes it possible to complete the fifth semester abroad.

The sixth semester is devoted to writing the bachelor's thesis.

Core Qualification

tudents gain basic knowledge	as well as deepend s	skills in mathematics and bu	isiness administration.

-	The course gives an introductory overview of the basics of supply chain management and logistics and their interaction wit
	freight traffic and thus the significance of traffic planning for business activities. In addition, examples of ecologically an
	economically sustainable best practice are discussed. The following subject areas are covered:
	Historical development of logistics
	Systemic thinking in logistics
	Concepts, trends and strategies in the field of
	Procurement logistics
	Production logistics
	Distribution logistics
	Reverse logistics
	Storage logistics
	• Transport logistics
	Handling logistics
	Basics of the connection between logistical decisions and traffic
	Introduction to traffic policy
	Scope for design of (sustainable) freight traffic and logistics
	The course contents will be consolidated by means of online surveys, Wiki entries by students and special practice sessions and
	illustrated by means of excursions.

Knowledge	
-	After taking part successfully, students have reached the following learning results
Professional Competence	The Non-technical Academic Programms (NTA)
	imparts skills that, in view of the TUHH's training profile, professional engineering studies require but are not able to cover fu Self-reliance, self-management, collaboration and professional and personnel management competences. The departme implements these training objectives in its teaching architecture , in its teaching and learning arrangements , in teachi areas and by means of teaching offerings in which students can qualify by opting for specific competences and a competer level at the Bachelor's or Master's level. The teaching offerings are pooled in two different catalogues for nontechni complementary courses.
	The Learning Architecture
	consists of a cross-disciplinarily study offering. The centrally designed teaching offering ensures that courses in the nontechni academic programms follow the specific profiling of TUHH degree courses.
	The learning architecture demands and trains independent educational planning as regards the individual development competences. It also provides orientation knowledge in the form of "profiles"
	The subjects that can be studied in parallel throughout the student's entire study program - if need be, it can be studied in one two semesters. In view of the adaptation problems that individuals commonly face in their first semesters after making a transition from school to university and in order to encourage individually planned semesters abroad, there is no obligation study these subjects in one or two specific semesters during the course of studies.
	Teaching and Learning Arrangements
	provide for students, separated into B.Sc. and M.Sc., to learn with and from each other across semesters. The challenge of deal with interdisciplinarity and a variety of stages of learning in courses are part of the learning architecture and are deliberat encouraged in specific courses.
	Fields of Teaching
	are based on research findings from the academic disciplines cultural studies, social studies, arts, historical studies, migrat studies, communication studies and sustainability research, and from engineering didactics. In addition, from the winter semes 2014/15 students on all Bachelor's courses will have the opportunity to learn about business management and start-ups in a go oriented way.
	The fields of teaching are augmented by soft skills offers and a foreign language offer. Here, the focus is on encouraging go oriented communication skills, e.g. the skills required by outgoing engineers in international and intercultural situations.
	The Competence Level
	of the courses offered in this area is different as regards the basic training objective in the Bachelor's and Master's fields. The differences are reflected in the practical examples used, in content topics that refer to different professional application contex and in the higher scientific and theoretical level of abstraction in the B.Sc.
	This is also reflected in the different quality of soft skills, which relate to the different team positions and different group leaders functions of Bachelor's and Master's graduates in their future working life.
	Specialized Competence (Knowledge)
	Students can
	 locate selected specialized areas with the relevant non-technical mother discipline, outline basic theories, categories, terminology, models, concepts or artistic techniques in the disciplines represented in learning area, different specialist disciplines relate to their own discipline and differentiate it as well as make connections, sketch the basic outlines of how scientific disciplines, paradigms, models, instruments, methods and forms of representat in the specialized sciences are subject to individual and socio-cultural interpretation and historicity, Can communicate in a foreign language in a manner appropriate to the subject.
Skills	Professional Competence (Skills)
	 In selected sub-areas students can apply basic methods of the said scientific disciplines, auestion a specific technical phenomena, models, theories from the viewpoint of another, aforementioned special discipline, to handle simple questions in aforementioned scientific disciplines in a sucsessful manner, justify their decisions on forms of organization and application in practical questions in contexts that go beyond technical relationship to the subject.
Personal Competence	
-	Personal Competences (Social Skills)
Social competence	
	Students will be able

Module Manual B. Mobility"	Sc. "Engineering and Management - Major in Logistics and
	 to present and analyze problems in the abovementioned fields in a partner or group situation in a manner appropriate to the addressees, to express themselves competently, in a culturally appropriate and gender-sensitive manner in the language of the country (as far as this study-focus would be chosen), to explain nontechnical items to auditorium with technical background knowledge.
Autonomy	Personal Competences (Self-reliance)
	Students are able in selected areas
	• to reflect on their own profession and professionalism in the context of real-life fields of application
	 to organize themselves and their own learning processes
	 to reflect and decide questions in front of a broad education background
	 to communicate a nontechnical item in a competent way in writen form or verbaly
	• to organize themselves as an entrepreneurial subject country (as far as this study-focus would be chosen)
Workload in Hours	Depends on choice of courses

Independent Study Time 62, Study Time in Lecture 28
Prof. Christoph Ihl, Katharina Roedelius
DE
WiSe/SoSe
In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools.
If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on s selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busin knowledge from the lecture should come to practical use. The group projects are guided by a mentor.

Module Responsible	Prof. Anusch Taraz			
Admission Requirements	None			
Recommended Previous Knowledge	School mathematics			
	After taking part successfully, students have reache	ed the following learning results		
Professional Competence				
Knowledge				
Knowledge	 Students can name the basic concepts in a 	analysis and linear algebra. They are abl	e to explain the	em using appropria
	examples.			
	 Students can discuss logical connections bet 	ween these concents. They are canable	of illustrating th	ese connections wi
	-	ween these concepts. They are capable	or muscialing in	ese connections wi
	the help of examples.			
	 They know proof strategies and can reproduce 	te them.		
Skills				
	 Students can model problems in analysis and 	d linear algebra with the help of the conce	epts studied in th	his course. Moreove
	they are capable of solving them by applying	established methods.		
	 Students are able to discover and verify furth 	ner logical connections between the conce	ots studied in the	e course.
	 For a given problem, the students can devi 	elop and execute a suitable approach, a	nd are able to c	ritically evaluate t
	results.	· · · · · · · · · · · · · · · · · · ·		,
Personal Competence				
Social Competence				
	 Students are able to work together in teams. 			
	 In doing so, they can communicate new cond 	cepts according to the needs of their coop	erating partners	. Moreover, they ca
	design examples to check and deepen the ur	nderstanding of their peers.		
Autonomy				
	 Students are capable of checking their under 	rstanding of complex concepts on their o	wn. They can sp	ecify open questio
	precisely and know where to get help in solvi	ng them.		
	 Students have developed sufficient persiste 	nce to be able to work for longer period	s in a goal-orien	ted manner on ha
	problems.

Content	In the era of time-competition production and logistics need to be considered as a combined strategic competitive advantage.
	"Introduction in to production logistics" gives an overview over the different disciplinces of production logistics:
	- Development from cost-, quality to time-competitiion,
	- fundamentals of production and logistics,
	- phase-oriented and functional subsystems of production logistics,
	- planning and steering,
	- analysis and optimization (focus: Lean Management),
	- production logistics controlling and supply-chain management in production network
	Theory is complented by case studies and guest presentations.

Mobility"						
Module M1286: Techr	nical Logistics					
Courses						
Title		Тур	Hrs/wk	СР		
Technical Logistics (L1746)		Lecture	3	3		
Technical Logistics (L1747)		Recitation Section (small)	2	3		
Module Responsible	Prof. Jochen Kreutzfeldt					
Admission Requirements	None					
Recommended Previous	Successful completion of the modules "Introduction in	to logistics and mobility", "Technical me	chanics 1", "Mat	thematics 1"		
Knowledge						
Educational Objectives	After taking part successfully, students have reached t	the following learning results				
Professional Competence						
Knowledge	The students will acquire the following skills:					
	1. The students know technical solutions for solving	logistical problems in the areas of wa	rehousing, conv	veying, sorting, orde		
	picking and identifying.					
	2. The students know approaches to introducing a sele	ected technical solution.				
	3. The students know practical examples of the preser	ted technical solutions.				
Skills	The students will acquire the following skills:					
	1. The students can select different technical solution	s for logistic problems of warehousing,	conveying, sorti	ng, order picking ar		
	identifying.					
	2. The students are able to evaluate critically the presented technical solutions with respect to their applicability for different					
	logistical problems and compare different alternatives					
	3. The students are able to assess the impact of select	ents are able to assess the impact of selected solutions.				
Personal Competence						
Social Competence	The students will acquire the following social skills:					
	1. The students will be able to sketch technical solutions for solving logistical problems of warehousing, conveying, sorting, order					
	picking and identifying and reflect on their own contrib	pution.				
	2. The technical solutions from the group are jointly do	ocumented and presented.				
	3. The students are able to present their technical solu	itions to an audience and they can deriv	ve new ideas and	d improvements from		
	the feedback.					
Autonomy	The students will acquire the following competencies:					
, accilonity	1. The students are able to sketch autonomously, but	under supervision, technical solutions t	o logistical prob	lems of warehousing		
	conveying, sorting, order picking and identifying.					
	2. The students are able to evaluate their technical so	lutions and discuss the pros and cons.

Cycle	SoSe
Content	The lecture gives an introduction in solutions and approaches of technical logistics. Five main topics will be addressed:
	(1) warehousing
	(2) conveying
	(3) sorting
	(4) order picking
	(5) identifying
	For each topic, various technical solutions are presented and discussed under consideration of advantages and disadvantages.
	This content is supplemented by practical examples that can be complemented by inviting guest lecturers.
	In the exercises selected technical solutions will be presented and discussed for certain problems and practiced by the students.

Content	The course provides an introductory overview over the fundamentals of urban and regional transport planning, including the sub- topic traffic engineering. The following subject areas are covered: • objectives of transport planning,
	 key mobility metrics,
	 measuring and predicting demand,
	 designing and planning transport infrastructure,
	fundamentals of traffic engineering and
	an introduction to transport concepts and planning processes.

	The course covers the basics of information technology in relation to logistics systems. The course is divided into five subject areas: (1) Planning of IT systems in logistics, (2) data acquisition systems, (3) communication systems, (4) IT-supported processing, (5) basic technological developments in information technology. The course consists of a basic lecture with connected exercise units.

Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	Students will receive in-depth knowledge and in-depth skills in a special area of business administration, engineering science logistics or mobility and can reproduce this knowledge.
Skills	After the project work in a business, engineering related, logistics and or mobility related research field, students are able to
	 familiarize themselves with a scientific and/or application-oriented problem
	 analyze the problem and find a solution (if appropriate as part of a team)
	 to refer to appropriate literature for the work on a problem as well as to critically evaluate publications
	 produce a scientifically sound written report on the problem in question (if appropriate as part of a team)
Personal Competence	
Social Competence	After the project work students are able to
	 work respectufully in teams and to organize themselves in teams
	 analyse a problem in a team and to find a solution together
	 present and defend their project work to a sizable (expert) audience
Autonomy	After the project work students are able to
	familiarize themselves successfully with a demanding scientific or application oriented problem independently
	prepare and deliver a presentation of their results independently

	The seminar "Gamification of Strategic Thinking" is offered as part of the elective course of studies "Logistics and Mobility" and currently offers space for 25 students. In cooperation with the German Armed Forces Command and Staff College, the seminar aims to teach strategic methods within the framework of a wargaming approach. For this purpose, the course consists of two blocks, which take place parallel to each other throughout the semester. In the theoretical block, students are taught the basics of various methods for strategy development and management (including SWOT analysis, SCRUM or Kanban). In the second block, the students apply the methods they have learned on the basis of the board game "Sycthe". For this, the students are divided into five groups with five members each. Each of these groups plays a "party" of the board game and is supposed to develop a strategy with the help of the learned methods that helps the respective team to win. Afterwards, the experiences will be reflected upon by means of a written elaboration and a proposal for an own business wargame will be developed.

Content	The course involves two main parts:
	During the first part of the course, participants are provided with insights into the market for ERP-Software and are provided with knowledge on how ERP-implementation projects proceed and how these projects should ideally be managed from a theoretical and practical perspective. In addition, participants are provided with an understanding of business functions and processes by means of visiting the TUHH model factory. In the model factory, participants and are solving special business cases on the basis of group-specific tasks. Finally, participants are introduced into the basic functioning of ERP-Software referring to the most common system (SAP). Participants gain a basic understanding of implementing organizational data, master data and processes into the system. During the second phase of this course, the students work independently in groups on deepening challenges, which conceptually build up on the executed case studies from phase one. Using the knowledge from phase one, the students are able to transfer the theoretical knowledge on the practical execution of the challes in SAP. The results of the group work will be presented in phase two.
Literature	 Participants will be provided with a course handout in the form of pptslides which can be downloaded in advance. Further literature references regarding the theoretical concepts are not provided (as this is part of the challenge in writing the thesis); literature references with regard to the ERP-System used are as follows: Agrawal, A. (2009): Customizing Materials Management Processes in SAP ERP Operations, Galileo Press: Boston. Arif, N./Tauseef, S. (2010): Integrating SAP ERP Financials, Galileo Press: Boston. Chudy, M./Castedo, L. (2015): Sales and Distribution in SAP ERP - Practical Guide, Galileo Press: Boston. Dickersback, J. T./Keller, G. 	The business simulation game Markstrat B2B - Markstrat is a business simulation which puts you into the role of managing the marketing division of the electro-mechanical business unit of a large corporation. Competing with several other companies, you try to successfully market two products to business customers. To this end, you and other students jointly develop and implement a long-term marketing strategy for your business unit. During the 10 rounds of the simulation game, the students and the randomly assigned student team make decisions in the areas of product development, advertising, sales, price, production, and human resources on a weekly basis. To make well-informed decisions, the student teams can draw on a large number of information sources such as customer surveys, experiments, market studies, and benchmarks which you need to analyze during each round of the simulation. The simulation is accompanied by a comprehensive introduction, a concomitant coaching, as well as a mid-term and final presentation. In addition, the student teams will prepare a written report.

Simulation of intra logistics (L1755)	
	Dr. Johannes Hinckeldevn
•	
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence	
Knowledge	The students will acquire the following knowledge:
	1. The students are able to explain the significance, the structure and the components of an event- and object-oriented simulat
	model in intralogistics.
	2. The students are able to reflect and explain the process of creating and programming an event- and object-oriented simulat
	model in intralogistics.
	3. The students are able to view critically the strengths and weaknesses of event- and object-oriented simulation model.
Chille	The students will essuite the following skiller
SKIIIS	The students will acquire the following skills: 1. The students will be able to derive the necessary parameters for the development of an event- and object-oriented simulat
	model in intralogistics from an existing logistics system.
	2. The students will be able to program and run Plant Simulation simulation models independently.
	3. The students can evaluate and interpret the results from a simulation model.
Personal Competence	
Social Competence	The students will acquire the following social skills:
	1. The students are able to develop a complex simulation model in a team.
	2. The students know the different roles in joint development of a simulation model and can give feedback to their respective ro
	3. The students are able to process the simulation results and present them in front of a audience.
Autonomy	The students will acquire the following independent competencies:
, aconomy	1. The students work independently in an initially unknown software (Plant Simulation).
	2. The students are able to derive independently the necessary simulation parameters from information about a logistics system
	3. The students are able to develop and program an event- and object-oriented simulation models from given parameters.

	The seminar provides an introduction to the development and programming of event and object-oriented simulation models based on the Plant Simulation software. The simulation models are focused on issues and problems in the field of intralogistics. The seminar will be conducted as a combination of theoretical content and autonomously solving simulation tasks on the computer. The students learn the ideal development workflow, programming and evaluation of a simulation model. Furthermore, the student will become familiar with the standard objects of a simulation model in Plant Simulation and their properties and functions. These standard objects will be used, if necessary with the assistance of the instructor, to build simulation models and analyze and evaluate the results. Furthermore, an introduction to the individual programming of simulation models is given on the basis of Sim Talk language.

Content	The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here, the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown.
	In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used to improve logistical systems.

Cycle	WiSe
	The lecture deals with the simulation of external logistics systems. The focus is therefore on the consideration of logistical processes between companies or on transhipment systems, such as ports or individual terminals.
	In the first part of the lecture, students will first acquire basic knowledge of external logistics systems and the advantages of using simulations to present them. Then an overview of existing simulation types and programs is given and examples for existing simulation models of logistic systems in science and practice are shown. Some simulation models will be demonstrated.
	In the second part of the lecture the students learn the basic handling of the simulation software Plant Simulation®. They receive theoretical explanations of the general functionality of the simulation tool, which are further deepened through the use of online tutorials. At the same time, three exercises, which build on each other, offer students the opportunity to implement the course content they have learnt in small groups. The exercises can be completed during the supervised lecture periods as well as at other times.
	The acquired knowledge is to be applied in the third part in the course of group work. The students will be divided into groups, each of which will then work on a relevant problem from the field of (external) logistic systems by means of simulation. The students are given a defined period of time for their work. During this time at least one person is always available for questions and suggestions. The results of the group work are to be documented in a simulation report and handed in at the end of the processing time. Finally, the individual groups present the problems they have worked on and their results in a presentation.

Admission Requirements	None			
Recommended Previous	Basic computer skills			
Knowledge	After taking part successfully, students	have reached the following learning results		
	After taking part successfully, students	have reached the following learning results		
Professional Competence Knowledge	The students will acquire the following l	knowledge:		
	1. The students are able to explain the	basics of object-oriented programming with Jav	a.	
	2. The students know the basic procedu	ires and commands of Java.		
	3. The students know the necessary too	ols for programming with Java.		
Skills	The students will acquire the following s	skills:		
	1. The students will be able to develop	and run programs with Java independently.		
	2. The students will be able to develop	and implement own objects and classes with Ja	va.	
	3. The students are able to identify and	overcome failures autonomously (debugging).		
Personal Competence				
Social Competence	The students will acquire the following s	social skills:		
	1. The students can explain self-develop	ped programs to other students.		
	2. The students can support others in fi	nding failures and mistakes in their software-co	ode.	
	3. The students are able to present thei	ir programs in front of a audience.		
Autonomy	The students will acquire the following o	competencies:		
	1. The students work independently wit	h an initially unknown programming language ((Java).	
	2. The students are able to derive indep	pendently the necessary source code for a given	n problem.	
	3. The students are able to write their o	own source code in Java based on given a proble	em.

Seminar
4
6
Independent Study Time 124, Study Time in Lecture 56
Dr. Johannes Hinckeldeyn
DE
WiSe
The seminar provides an introduction to object-oriented programming with Java. Practical knowledge will be transferred through programming exercises parallel to theoretical content. The exercises will deal mainly with logistical problems. The seminar will be conducted as an integrated seminar with a combination of theoretical content and autonomously solved programming problems on the computer. Furthermore, the student will become familiar with the standard libraries of Java and their properties and functions. These standard objects will be used, if necessary with the assistance of an instructor, to build own programs. Furthermore, an introduction to the actual software development kits (SDK) of Java will be given.

Module M0608: Basic	s of Electrical Engineering			
Courses				
Title		Тур	Hrs/wk	СР
Basics of Electrical Engineering (L0	290)	Lecture	3	4
Basics of Electrical Engineering (L0	292)	Recitation Section (small)	2	2
Module Responsible	Prof. Thorsten Kern			
Admission Requirements	None			
Recommended Previous	Basics of mathematics			
Knowledge				
Educational Objectives	After taking part successfully, students ha	ve reached the following learning results		
Professional Competence				
Knowledge	Students can to draw and explain circuit	diagrams for electric and electronic circuits with	a small number	of components. The
	can describe the basic function of electri	c and electronic componentes and can present t	he corresponding	equations. They ca
	demonstrate the use of the standard meth	nods for calculations.		
Skills	Students are able to analyse electric ar	nd electronic circuits with few components and	to calculate selec	ted quantities in th
	circuits. They apply the ususal methods of	f the electrical engineering for this.		
Personal Competence				
Social Competence				
Autonomy	Students are able independently to analys	se electric and electronic circuits and to calculate s	selected quantities	in the circuits.
Workload in Hours	Independent Study Time 110, Study Time	in Lecture 70

Fundamentals of Materials Science		Lecture	2	2
	II (Advanced Ceramic Materials, Polymers and Composites) (L0506)	Lecture	2	2
Physical and Chemical Basics of Ma		Lecture	2	2
Module Responsible				
Admission Requirements				
	Highschool-level physics, chemistry und mathematics			
Knowledge				
	After taking part successfully, students have reached the follow	ing learning results		
Professional Competence				
Knowledge	The students have acquired a fundamental knowledge on r			
	comprehensively. Fundamental knowledge here means specific			
	phase transformations, corrosion and mechanical properties. Th			
	for materials and can identify relevant approaches for cha		properties. They are able	to trace materi
	phenomena back to the underlying physical and chemical laws	of nature.		
Skills	The students are able to trace materials phenomena back t	o the underlying phy	sical and chemical laws	of nature. Materi
	phenomena here refers to mechanical properties such as strength, ductility, and stiffness, chemical properties such as corrosion			
	resistance, and to phase transformations such as solidificatio	n, precipitation, or m	nelting. The students can	explain the relat
	between processing conditions and the materials microstructu	ure, and they can acc	count for the impact of m	icrostructure on
	material's behavior.			
Personal Competence				
Social Competence	-

Knowledge Educational Objectives	After taking part successfully, students have reached	the following learning results		
	After taking part successiony, stadents have redened	the following learning results		
Professional Competence				
Knowledge	• Students can name the basic concepts in the a	rea of analysis and differential equations	They are able t	to explain them usir
	appropriate examples.			
	 Students can discuss logical connections betw 	een these concepts. They are capable	of illustrating th	ese connections wit
	the help of examples.			
	They know proof strategies and can reproduce	them.		
Skills				
38///5	Students can model problems in the area of an	alysis and differential equations with the	e help of the cor	ncepts studied in th
	course. Moreover, they are capable of solving t			
			to studied in the	COURCO
	Students are able to discover and verify further			
	 For a given problem, the students can develop 	op and execute a suitable approach, ar	nd are able to c	ritically evaluate th
	results.			
Personal Competence				
-				
Social Competence	• Students are able to work together in teams. T	hey are capable to use mathematics as a	a common langu	age.
	 In doing so, they can communicate new concerning 			
			erating partners	. Moreover, they ca
	design examples to check and deepen the unde	erstanding of their peers.		
Autonomy				
	 Students are capable of checking their unders 	tanding of complex concepts on their or	wn. They can sp	ecify open question
	precisely and know where to get help in solving	g them.		
	Students have developed sufficient persistence	e to be able to work for longer periods	s in a goal-orien	ted manner on har
	problems.		g	
	problems.

Cycle	WiSe/SoSe
Content	Experiment 1: Emission and immission measurement of gaseous pollutants: different technologies to determine different gaseous pollutants in automotive exhaust are used.
	Experiment 2: Simulation and measurement of asynchrone engine and rotary pump: the dynamic behaviour of e pump engine will be investigated. The starting will be simulated on a PC and compared with measurement.
	Experiment 3: Michelson interferometer and fiber optic: fundamental optical phenonema will be understood and applications with Michelson interferometer and optical fibers demonstrated.
	Experiment 4:Identification of the parameters of a control system and optimal control parameters

Module Responsible					
Admission Requirements	None				
Recommended Previous Knowledge	none				
Educational Objectives	After taking part successfully, students	have reached the following learning results			
Professional Competence Knowledge	Students are able to:				
	- explain and classify the terms and the	ir meaning in transport and handling technology			
	- reflect current political conditions and	technical developments in transport and handling	technology;		
	- identify actors and their tasks in the n	naritime transport chain (pre-carriage, carriage, on	carriage);		
	- determine, compare and assign suitable applications and areas of use of transport and handling techniques based on the questions: What will be transported? On what should it be transported? Where is the cargo to be handled? By which means?				
Skills	Students can, on the basis of the knowl	edge they have acquired:			
	- identify and evaluate key performance	e indicators (e.g. transport times, storage costs, etc	:.) in the maritime tr	ansport chain;	
	- select and dimension suitable techniques for defined transport and handling tasks and critically evaluate approaches to solution:				
		and handling technologies (e.g. by calculating carl as point-to-point or hub-and-spoke freight transpo		port times and co	
Personal Competence Social Competence	Students are able to:				
		and organise research tasks in small groups in present and represent them in a comprehensible w		mprehensive write	
		roblems (e.g. in the joint compilation of factual kno ent of different maritime supply chains);	wledge on topics su	uch as slow steam	
	- participate in technical discussions on	topics from the transport and handling technology			
Autonomy	After completion of the module student	s capable to:			
	- acquire knowledge of parts of the sub	ject area independently and apply the acquired kno	wledge to solve new	<i>w</i> problems;	
	- conduct a systematic literature search	and record this in a scientific text;			
	- critically reflect on the results of their	own work.

Content	The course Transportation and Handling Technology teaches the basics, possible applications and areas of application of transportation and handling techniques. The students are enabled to select, evaluate and dimension suitable techniques for defined transport and handling tasks. In addition, a basic knowledge of the relevant guidelines and standards is taught. The lecture is part of the bachelor's program "Logistics and Mobility" and is particularly aimed at students in their third semester. The aim is to convey the basics, possible applications and usefulness of the various transport and handling tasks. In addition to the enabled to select, evaluate and dimension suitable techniques of the various transport and handling tasks. In addition to the transported goods and loading units, the various means of transport, handling terminals and the necessary equipment play a special role. Furthermore, it is possible to build up a basic knowledge of the relevant guidelines and standards. In addition to road, rail, water (inland and sea shipping), air, combined transport is also addressed.
	 Contents of the lecture Basics, possible applications, usefulnes of different transport and handling techniques Overview of transported goods, loading units, means of transport, handling terminals and equipment Representation of the modes of transport: road, rail, water (inland waterway, ocean-going vessel), air, combined transport

Content	The exercise consists of two parts. In the first part, the topics presented in the lecture are deepened by means of guided quantitative group exercises.
	In the second part of the exercise, students work on a topic throughout the semester in the context of research-based learning.
	This takes place in so-called research-based learning: "Research-based learning is characterized [] by the fact that the students (co-)design, experience and reflect on the process of a research project, which is aimed at gaining knowledge that is also of interest to third parties, in its essential phases - from the development of questions and hypotheses to the selection and execution of methods to the examination and presentation of the results in independent work or in active participation in a comprehensive project" (translated from German / Huber 2009, p.11).
	The students apply the knowledge they have acquired in the course of two written papers. These written assignments are carried out as group work.
	The contents of the written papers deal, for example, with the presentation of the entire maritime supply chain of different types of goods, such as containers, crude oil, project cargo or RoRo.
	Students can achieve a total of up to 10% for both written papers.

Admission Requirements Recommended Previous	None Representation of signals and systems in time and	frequency domain. Laplace transform		
Knowledge	representation of signals and systems in time and	inequency domain, Laplace transform		
Educational Objectives	After taking part successfully, students have reach	ned the following learning results		
Professional Competence		5 5		
Knowledge				
	Students can represent dynamic system be first and assend order systems	havior in time and frequency domain, and	can in particular	explain properties
	first and second order systemsThey can explain the dynamics of simple co	ntrol loops and interpret dynamic propertie	es in terms of fre	quency response a
	root locus	interpret dynamic property		quency response a
	 They can explain the Nyquist stability criter 	ion and the stability margins derived from i	it.	
	They can explain the role of the phase marg			
	 They can explain the way a PID controller a 	ffects a control loop in terms of its frequence	cy response	
	 They can explain issues arising when control 	ollers designed in continuous time domain a	are implemented	digitally
Skills				
	Students can transform models of linear dy		nain and vice vers	sa
	They can simulate and assess the behavior			
	 They can design PID controllers with the he They can analyze and synthesize simple control 			a tachniquae
	They can calculate discrete-time approx			
	implementation		tindous tinte un	a use it for aigi
	 They can use standard software tools (Matla 	ab Control Toolbox, Simulink) for carrying o	ut these tasks	
Personal Competence				
	Students can work in small groups to jointly solve			
Autonomy	Students can obtain information from provided s	sources (lecture notes, software document	tation, experimer	nt guides) and use
	when solving given problems.			
	They can assess their knowledge in weekly on-line	tests and thereby control their learning pr	ogress.	
	They can assess their knowledge in weekly on-line	tests and thereby control their learning pr	ogress.

Production Logistics Seminar (L125	3)	Seminar	2	6
Module Responsible	Prof. Thorsten Blecker			
Admission Requirements	None			
Recommended Previous	none			
Knowledge				
Educational Objectives	After taking part successfully, students have	e reached the following learning results		
Professional Competence				
Knowledge	Knowledge: Students will have acquired kn	owledge in the following areas:		
	 interaction of production and logistics and 	d interdependencies		
	 production-related logistics topics 			
Skills	Skills: Students will based on the acquired	knowledge be in a position to		
	 assess issues on production logistics 			
	• to be able to deal critically with developn	nents in production logistics and assess the	se critically;	
	• to work independently on current topics f	rom the field of "production logistics";		
Personal Competence				
Social Competence				
	Social competence: After completing the m	odule students are capable of		
	• to conduct subject-specific and interdisci	plinary discussions;		
	 present orally and in writing their results; 			
	 respectful team work 			
Autonomy	After completing the module students are	capable to work independently on a subject	t and transfer the acquire	d knowledge to i
	problems.			
Workload in Hours	Independent Study Time 152, Study Time i	n Lecture 28

Content	Within the Production Logistics Seminar the students shall compose a first term paper. In the beginning production-close logstic topics will be distributed which the students have to elaborate on their own. This workshop aims at the better motivation of the students to structure new and creative ideas and develop them to innovative solutions. This workshop contains regular meetings as well as two presentations in the middle and at the end.	
Literature	Skripte und Textdokumente, die während der Vorlesung herausgegeben werden.	

	tical systems - Industry 4.0
Courses	
Title	Typ Hrs/wk CP
Logistics systems - Industry 4.0 (L1	
	Prof. Jochen Kreutzfeldt
Admission Requirements	None
	Successful completion of the module "Technical Logistics"
Knowledge	After taking part successfully, students have reached the following learning results
Professional Competence	After taking part successionly, students have reached the following learning results
-	The students will acquire the following knowledge: 1. The students are able to understand and explain the concept "Logistical System".
	2. The students are able to describe and analyze logistical systems.
	 Students are able to explain and critically evaluate application cases and business models of the Industry 4.0 idea in the cor of logistical systems.
Skills	The students will acquire the following skills: 1. The students are able to identify logistical systems, analyze and identify potential for change and improvement.
	2. The students know different technical solutions to address problems in logistical systems.
	3. The students are capable of deploying technical solutions and ideas from the concept Industry 4.0 to deal with logis problems.
Personal Competence	
Social Competence	The students will acquire the following social skills:
	1. The students are able to develop technical solutions for logistical systems and reflect their contribution within the team.
	2. The technical solutions from the group can be jointly documented and presented.
	3. Students are able to present their technological solutions to an audience and derived from the critique new ideas improvements.
Autonomy	The students will acquire the following independent competencies: 1. The students can independently develop technical solutions for logistical problems under supervision.
	2. The students are able to evaluate their technical solutions and discuss the pros and cons.
	3. The students are able to assess the impact of the concept Industry 4.0 on their own career development.
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56
Credit points	6
Course achievement	None
Examination	Written elaboration
Examination duration and scale	Lab prototype with documentation (group work)
Assignment for the	Logistics and Mobility: Specialisation Logistics and Mobility: Elective Compulsory

Course L1753: Logistics syst	ems - Industry 4.0
Тур	Seminar
Hrs/wk	4
CP	6
Workload in Hours	Independent Study Time 124, Study Time in Lecture 56
Lecturer	Prof. Jochen Kreutzfeldt
Language	DE
Cycle	WiSe
Content	The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here, the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown.
	In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used to improve logistical systems.

Workload in Hours	Independent Study Time 78, Study Time in Lecture 42	
Lecturer	Prof. Thorsten Kern, Dennis Kähler	
Language	DE	
Cycle	SoSe	
Content	Electric field: Coulomb's law, flux (field) line, work, potential, capacitor, energy, force, capacitive actuators	
	Magnetic field: force, flux line, Ampere's law, field at bounderies, flux, magnetic circuit, hysteresis, induction, self-induction, mutual inductance, transformer, electromagnetic actuators	
	Synchronous machines, construction and layout, equivalent single line diagrams, no-load and short-cuircuit characteristics, vector diagrams, motor and generator operation, stepper motors	
	DC-Machines: Construction and layout, torque generation mechanismen, torque vs speed characteristics, commutation,	
	Asynchronous Machines. Magnetic field, construction and layout, equivalent single line diagram, complex stator current diagram (Heylands 'diagram), torque vs. speed characteristics, rotor layout (squirrel-cage vs. sliprings),	
	Drives with variable speed, inverter fed operation, special drives

	The seminar provides an introduction to the development and programming of event and object-oriented simulation models based on the Plant Simulation software. The simulation models are focused on issues and problems in the field of intralogistics. The seminar will be conducted as a combination of theoretical content and autonomously solving simulation tasks on the computer. The students learn the ideal development workflow, programming and evaluation of a simulation model. Furthermore, the student will become familiar with the standard objects of a simulation model in Plant Simulation and their properties and functions. These standard objects will be used, if necessary with the assistance of the instructor, to build simulation models and analyze and evaluate the results. Furthermore, an introduction to the individual programming of simulation models is given on the basis of Sim Talk language.

Content	This course places its focus on transport and mobility in Germany. It deals with questions such as:
	 Which external factors - like e.g. energy costs, availability of renewable and fossil fuels, environmental and climate protection objectives - influence current developments in the transport sector? Which external effects in turn are caused by mobility choices and traffic? How should these interactions be evaluated, how and by whom can they be influenced? Which measures at the municipal level can contribute to a more sustainable transport system? During the course, these questions will be illustrated and discussed with reference to different examples and current developments. Participants will also provide input on specific topics. Potential core subjects of the course could be: Environmental Justice : which population groups are disproportionately affected by transport emissions and who causes them? Municipal cycle planning Transport and Climate Protection: can, want, act - everything could be, nothing must be?
Literature	Die Literaturempfehlungen sind abhängig von den jeweiligen, wechselnden Themenschwerpunkten und werden rechtzeitig vor Beginn der Veranstaltung bekannt gegeben.

Course L1182: Mobility in Me	egacities and Developing Countries

Content	The course provides and overview over different transport projects in the metropolitan areas of developing countries. Considering different perspectives on urban growth, social justice, economic development, environmental and climate protection as well as the economic viability of public transport, the specific situation in the urban conglomerates of Asia, Latin America and Africa will be analysed and placed in a regional and global context. Specific public transport systems will be examined to establish, whether they are a suitable example for sustainable urban development. The following examples could be suitable case studies: Singapore (Metro), Lagos (BRT Light), Guanghzou, Bogota, Jakarta (Full BRT), Sao Paulo, Medellin (Cable Car Systems), Johannesburg (Minibus-Taxi). The course will be designed interactively with the students and will partly be in English as is the majority of the literature in this area (also: Skype online interviews with international experts in the transport sector).

Content	The course Transportation and Handling Technology teaches the basics, possible applications and areas of application of transportation and handling techniques. The students are enabled to select, evaluate and dimension suitable techniques for defined transport and handling tasks. In addition, a basic knowledge of the relevant guidelines and standards is taught. The lecture is part of the bachelor's program "Logistics and Mobility" and is particularly aimed at students in their third semester. The aim is to convey the basics, possible applications and usefulness of the various transport and handling tasks. In addition to the enabled to select, evaluate and dimension suitable techniques of the various transport and handling tasks. In addition to the enabled to select, evaluate and dimension suitable techniques for defined transport and handling tasks. In addition to the transported goods and loading units, the various means of transport, handling terminals and the necessary equipment play a special role. Furthermore, it is possible to build up a basic knowledge of the relevant guidelines and standards. In addition to road, rail, water (inland and sea shipping), air, combined transport is also addressed.
	 Contents of the lecture Basics, possible applications, usefulnes of different transport and handling techniques Overview of transported goods, loading units, means of transport, handling terminals and equipment Representation of the modes of transport: road, rail, water (inland waterway, ocean-going vessel), air, combined transport

Content	The exercise consists of two parts. In the first part, the topics presented in the lecture are deepened by means of guided quantitative group exercises.
	In the second part of the exercise, students work on a topic throughout the semester in the context of research-based learning.
	This takes place in so-called research-based learning: "Research-based learning is characterized [] by the fact that the students (co-)design, experience and reflect on the process of a research project, which is aimed at gaining knowledge that is also of interest to third parties, in its essential phases - from the development of questions and hypotheses to the selection and execution of methods to the examination and presentation of the results in independent work or in active participation in a comprehensive project" (translated from German / Huber 2009, p.11).
	The students apply the knowledge they have acquired in the course of two written papers. These written assignments are carried out as group work.
	The contents of the written papers deal, for example, with the presentation of the entire maritime supply chain of different types of goods, such as containers, crude oil, project cargo or RoRo.
	Students can achieve a total of up to 10% for both written papers.

Module M1289: Lógis	stical systems - Industry 4.0				
Courses					
Title	Тур	Hrs/wk	СР		
Logistics systems - Industry 4.0 (L1	1753) Seminar	4	6		
Module Responsible	Prof. Jochen Kreutzfeldt				
Admission Requirements	s None				
Recommended Previous Knowledge	s Successful completion of the module "Technical Logistics"				
Educational Objectives	After taking part successfully, students have reached the following learning results				
Professional Competence					
Knowledge	 The students will acquire the following knowledge: 1. The students are able to understand and explain the concept "Logistical System". 				
	2. The students are able to describe and analyze logistical systems.				
	3. Students are able to explain and critically evaluate application cases and business models of of logistical systems.	he Industry 4.0	idea in the conte		
Skills	s The students will acquire the following skills: 1. The students are able to identify logistical systems, analyze and identify potential for change	and improveme	nt.		
	2. The students know different technical solutions to address problems in logistical systems.				
	3. The students are capable of deploying technical solutions and ideas from the concept In problems.	ndustry 4.0 to	deal with logistic		
Personal Competence					
Social Competence	The students will acquire the following social skills: 1. The students are able to develop technical solutions for logistical systems and reflect their co	ntribution withir	n the team.		
	2. The technical solutions from the group can be jointly documented and presented.				
	3. Students are able to present their technological solutions to an audience and derived improvements.	from the critiq	ue new ideas ai		
Autonomy	 The students will acquire the following independent competencies: 1. The students can independently develop technical solutions for logistical problems under supersection of the students of the st	ervision.			
	2. The students are able to evaluate their technical solutions and discuss the pros and cons.				
	3. The students are able to assess the impact of the concept Industry 4.0 on their own career de	velopment.

Workload in Hours	Independent Study Time 124, Study Time in Lecture 56
Lecturer	Prof. Jochen Kreutzfeldt
Language	DE
Cycle	WiSe
Content	The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown.
	In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used t improve logistical systems.

Knowledge				
-				
Educational Objectives	After taking part successfully, students have rea	ched the following learning results		
Professional Competence				
Knowledge				
	 Students can represent dynamic system b first and second order systems 	senavior in time and frequency domain, and	can în particular	explain properties
	 They can explain the dynamics of simple 	control loops and interpret dynamic properti	es in terms of fre	quency response a
	root locus	and the second		
	• They can explain the Nyquist stability crite	erion and the stability margins derived from	it.	
	 They can explain the role of the phase may 	rgin in analysis and synthesis of control loop	os	
	They can explain the way a PID controller	affects a control loop in terms of its frequen	cy response	
	 They can explain issues arising when cont 	rollers designed in continuous time domain	are implemented	digitally
Skills				
	Students can transform models of linear d They can simulate and excess the behavior		nain and vice vers	sa
	 They can simulate and assess the behavior They can design PID controllers with the h 		-	
	 They can analyze and synthesize simple c 			se techniques
	They can calculate discrete-time approx			
	implementation			
	They can use standard software tools (Ma	tlab Control Toolbox, Simulink) for carrying o	out these tasks	
Personal Competence				
-	Students can work in small groups to jointly solv	e technical problems, and experimentally va	lidate their contro	oller designs
	Students can obtain information from provided			
	when solving given problems.			
	when solving given problems. They can assess their knowledge in weekly on-lir	ne tests and thereby control their learning p	rogress.

Course L1352: Simulation of	Transport and Handling Systems
Тур	Lecture
Hrs/wk	1
СР	2
Workload in Hours	Independent Study Time 46, Study Time in Lecture 14
Lecturer	Prof. Carlos Jahn
Language	DE
Cycle	WiSe
Content	The lecture deals with the simulation of external logistics systems. The focus is therefore on the consideration of logistical processes between companies or on transhipment systems, such as ports or individual terminals.
	In the first part of the lecture, students will first acquire basic knowledge of external logistics systems and the advantages of using simulations to present them. Then an overview of existing simulation types and programs is given and examples for existing simulation models of logistic systems in science and practice are shown. Some simulation models will be demonstrated.
	In the second part of the lecture the students learn the basic handling of the simulation software Plant Simulation®. They receive theoretical explanations of the general functionality of the simulation tool, which are further deepened through the use of online tutorials. At the same time, three exercises, which build on each other, offer students the opportunity to implement the course content they have learnt in small groups. The exercises can be completed during the supervised lecture periods as well as at other times.
	The acquired knowledge is to be applied in the third part in the course of group work. The students will be divided into groups, each of which will then work on a relevant problem from the field of (external) logistic systems by means of simulation. The students are given a defined period of time for their work. During this time at least one person is always available for questions and suggestions. The results of the group work are to be documented in a simulation report and handed in at the end of the processing time. Finally, the individual groups present the problems they have worked on and their results in a presentation.

Content	In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solutions are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallel to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards.

Content	Lecture:		
	The module provides a basic knowledge of the field of railroad engineering. An overview of railroad operations, control and safety technology, railroad superstructure, structural engineering, project management as well as maintenance and design of infrastructure facilities is given. The aim of this module is to give students as much insight as possible into railroad infrastructure. The module is examined by means of a written exam at the end of the semester. Lecture Hall Exercise: In order to give the students practical examples, full-day practical excursions are carried out. New handling techniques and currently available hardware will be presented by visiting the marshalling yard "die Zugbildungsanlage Maschen (ZBA)". Furthermore, the training center for track construction and civil engineering as well as the operations center in Hanover will be visited, where facilities and tasks will be presented.

Admission Requirements	According to General Regulations §21 (1):
	At least 126 ECTS credit points have to be achieved in study programme. The examinations board decides on exceptions.
Recommended Previous	
Knowledge	
Educational Objectives	After taking part successfully, students have reached the following learning results
Professional Competence Knowledge	
	The students can select, outline and, if need be, critically discuss the most important scientific fundamentals of their course
	of study (facts, theories, and methods). • On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of
	 On the basis of their fundamental knowledge of their subject the students are capable in relation to a specific issue of opening up and establishing links with extended specialized expertise.
	 The students are able to outline the state of research on a selected issue in their subject area.
Skills	
5K1115	• The students can make targeted use of the basic knowledge of their subject that they have acquired in their studies to solve
	subject-related problems.
	 With the aid of the methods they have learnt during their studies the students can analyze problems, make decisions on technical issues, and develop solutions.
	 The students can take up a critical position on the findings of their own research work from a specialized perspective.
	······································
Personal Competence	
Social Competence	Both in writing and orally the students can outline a scientific issue for an expert audience accurately, understandably and
	in a structured way.
	• The students can deal with issues in an expert discussion and answer them in a manner that is appropriate to the
	addressees. In doing so they can uphold their own assessments and viewpoints convincingly.
Autonomy	
Autonomy	• The students are capable of structuring an extensive work process in terms of time and of dealing with an issue within a
	specified time frame.
	 The students are able to identify, open up, and connect knowledge and material necessary for working on a scientific problem.
	 The students can apply the essential techniques of scientific work to research of their own.
