

Module Manual

Bachelor of Science (B.Sc.)

Engineering and Management -Major in Logistics and Mobility Dual study program

Cohort: Winter Term 2022 Updated: 30th May 2024

Table of Contents

| Table of Conten | | 2 |
|------------------------------------|--|------------|
| Program descrip | | 4 |
| Core Qualificati | | 6 |
| | ntroduction to Logistics and Mobility oundations of Management | 6 9 |
| Module M0829: 1 Module M0850: N | | 11 |
| pr | Engineering Mechanics I (Stereostatics) | 13 |
| | inking theory and practice (dual study program, Bachelor's degree) | 15 |
| Module M1750: P | Practical module 1 (dual study program, Bachelor's degree) | 17 |
| | ogistics Management | 19 |
| Module M0851: M | | 22 |
| | Engineering Mechanics II (Elastostatics) Fechnical Logistics | 24 |
| | Fechnical drawing and CAD | 26 28 |
| | Practical module 2 (dual study program, Bachelor's degree) | 30 |
| | Fechnical Complementary Course for Logistics and Mobility (according to Subject Specific | |
| Regulations) | | 32 |
| p | ntroduction to Economics | 33 |
| | Transportation Planning and Traffic Engineering | 35 |
| | Project Management and Accounting | 37 39 |
| | Computer Science for Engineers - Introduction and Overview Practical module 3 (dual study program, Bachelor's degree) | 41 |
| | T applications for logistics and mobility | 43 |
| | ntroduction to Operations Research and Statistics | 45 |
| Module M1261: N | Aanagement | 48 |
| | Practical module 4 (dual study program, Bachelor's degree) | 49 |
| | thics and Technology - Responsible Innovation | 51 |
| | Practical module 5 (dual study program, Bachelor's degree) | 52 |
| | Business Administration and Enterprise Resource Planning: CERMEDES AG | 54 |
| | Gamification of Strategic Thinking Legal Foundations of Logistics and Mobility | 56 57 |
| | nnovation and product development - a business game | 58 |
| | Business Simulation Marktstrat | 59 |
| | Scientific Elaboration | 61 |
| 10 M | Project Seminar WILUM | 61 |
| Module M0681: P | Project Course Logistics and Mobility | 62 |
| | . Information Technology | 63 |
| | Computer Science for Engineers - Programming Concepts, Data Handling & Communication | 63 |
| | Simulation of intra logistics | 65 |
| | Vew Technologies and Markets | 67 68 |
| | Graph Theory and Optimization Electrical Machines and Actuators | 70 |
| | Fundamentals of Mechanical Engineering Design | 72 |
| | ogistics Service Provider Management | 74 |
| Module M2016: S | Strategic Management of Technological Innovation | 76 |
| | Process Management | 77 |
| Module M1593: D | | 78 |
| | ntroduction to Control Systems | 80 |
| Module M1423: A Module M1592: S | Algorithms and Data Structures | 82 84 |
| Module M1392: 3 Module M0853: M | | 86 |
| | Simulation of Transport and Handling Systems | 89 |
| Module M1981: A | Automation in logistics | 91 |
| Module M1349: C | Dbject-oriented programming in logistics | 93 |
| Module M1289: L | ogistical systems - Industry 4.0 | 95 |
| | Aachine Learning I | 97 |
| | ogistics, Transport and Environment | 99 |
| Module M0727: S | | 101 |
| Modulo M0865 | Production Management and Processes | 103 |
| | Jaw Tashualan'ao and Maukata | 105 |
| | Fundamentals of Mechanical Engineering Design | 106 |
| | Production Engineering | 108 |
| Module M0608: E | Basics of Electrical Engineering | 111 |
| | Strategic Management of Technological Innovation | 113 |
| | Process Management | 114 |
| | Aeasurement Technology for Mechanical Engineers | 115 |
| Module M0933: F Module M0853: N | undamentals of Materials Science | 118 120 |
| | Production Logistics | 120 |
| | Traffic systems and handling technology | 124 |

| Module M1981: Automation in logistics | 126 |
|---|-----|
| Module M0833: Introduction to Control Systems | 128 |
| Module M1070: Simulation of Transport and Handling Systems | 130 |
| Module M1289: Logistical systems - Industry 4.0 | 132 |
| Module M1349: Object-oriented programming in logistics | 134 |
| Module M0610: Electrical Machines and Actuators | 136 |
| Module M0980: Logistics, Transport and Environment | 138 |
| Module M1014: Logistics Service Provider Management | 140 |
| Module M1290: Simulation of intra logistics | 142 |
| Specialization II. Traffic Planning and Systems | 144 |
| Module M0986: Introduction to Transportation Economics | 144 |
| Module M0983: Mobility Concepts | 145 |
| Module M1897: New Technologies and Markets | 147 |
| Module M2016: Strategic Management of Technological Innovation | 148 |
| Module M1013: Traffic systems and handling technology | 149 |
| Module M0608: Basics of Electrical Engineering | 151 |
| Module M0740: Structural Analysis I | 153 |
| Module M0853: Mathematics III | 155 |
| Module M1070: Simulation of Transport and Handling Systems | 158 |
| Module M0833: Introduction to Control Systems | 160 |
| Module M0706: Geotechnics I | 162 |
| Module M1289: Logistical systems - Industry 4.0 | 164 |
| Module M2047: Hydromechanics and Hydrology | 166 |
| Module M0852: Graph Theory and Optimization | 168 |
| Module M0767: Aeronautical Systems | 170 |
| Module M0536: Fundamentals of Fluid Mechanics | 172 |
| Module M1633: Planning Law and Environmental Law/ Sustainable Urban Development | 175 |
| Module M1014: Logistics Service Provider Management | 176 |
| Module M0985: Introduction to Railways | 178 |
| Module M0980: Logistics, Transport and Environment | 180 |
| Module M0671: Technical Thermodynamics I | 182 |
| Module M0610: Electrical Machines and Actuators | 184 |
| Thesis | 186 |
| Module M1800: Bachelor thesis (dual study program) | 186 |

Program description

Content

Economic development with its rapid change in products and processes has also led, among other things, to a considerable restructuring of the intercompany division of labor. Today, this division of labor is characterized by cross-company value chains in which complex production processes have to be planned, sustainably designed and controlled. Logistics and its basic functions, transport, handling and warehousing, play a central role in this. Mobility is understood in the sense of social participation and opportunities for movement. Successful, socially and ecologically compatible economic activity under such conditions is made possible by the interaction of innovative technical systems, information and communication technologies, and management strategies.

The bachelor's degree program "Engineering and Management - Major in Logistics and Mobility" prepares graduates for professional activities in this interdisciplinary field. Extensive, interdisciplinary basic knowledge from the natural and engineering sciences and from business administration is taught. The effects on society as a whole are always included. By working on a wide range of tasks from various application areas of logistics and mobility, students also learn how to deal with specific issues, thus acquiring a meaningful mix of practical and scientific skills.

In addition to the foundational curriculum taught at TUHH, seminars on developing personal skills are integrated into the dual study programme, in the context of transfer between theory and practice. These seminars correspond to the modern professional requirements expected of an engineer, as well as promoting the link between the two places of learning.

The intensive dual courses at TUHH integrating practical experience consist of an academic-oriented and a practice-oriented element, which are completed at two places of learning. The academic-oriented element comprises study at TUHH. The practice-oriented element is coordinated with the study programme in terms of content and time, and consists of practical modules and phases spent in an affiliate company during periods when there are no lectures.

Career prospects

Graduates of the program can enter directly into professions in the field of logistics or transportation planning. The degree program prepares them for independent and joint activities in responsible positions.

Possible employers include, for example, companies in the logistics sector, trading companies, manufacturing companies, engineering and planning offices, transport companies, construction companies, infrastructure operators and the public sector.

At Hamburg University of Technology, graduates have the opportunity, among other things, to follow the bachelor's degree program in "Engineering and Management - Major in Logistics and Mobility" with a master's degree in "Logistics, Infrastructure, and Mobility" or in "International Management and Engineering".

In addition, students acquire basic professional and personal skills as part of the dual study programme that enable them to enter professional practice at an early stage and to go on to further study. Students also gain practical work experience through the integrated practical modules. Graduates of the dual course have broad foundational knowledge, fundamental skills for academic work and relevant personal competences.

Learning target

The bachelor's degree program in "Engineering and Management - Major in Logistics and Mobility" prepares students both for a professional career and for a relevant master's degree program. The basic methodological knowledge required for this is acquired during the course of study. The learning outcomes of the program are achieved through an interplay of basic and advanced modules from the fields of logistics, engineering and business administration and can be specialized in one of three specializations. The learning objectives are divided below into the categories of knowledge, skills, social competence and independence.

Knowledge

Knowledge is constituted by facts, principles and theories and is acquired in the Bachelor's program "Engineering and Management - Major in Logistics and Mobility" in the following areas:

- 1. Graduates are able to explain the basic methods, procedures and interrelationships of engineering sciences, in particular mathematics, engineering mechanics and computer science.
- 2. Graduates will be able to explain the basic methods, procedures and interrelationships of economics, business administration and management.
- 3. Graduates will be able to explain the methods, procedures and interrelationships of logistics and transportation planning and provide an overview of their subject and the interrelationships between the sub-disciplines of logistics.
- 4. Graduates are able to place their subject in the overall societal, social and economic context.

Skills

The ability to apply acquired knowledge in order to solve specific problems is supported in many ways in the degree program "Engineering and Management - Major in Logistics and Mobility":

- 1. Graduates are able to solve technical problems, as well as design new technical systems of logistics and transportation systems.
- 2. Graduates are able to evaluate technical systems of logistics and transport systems economically and ecologically.
- 3. Graduates are able to analyze, plan, design and control the flow systems (goods, people, information, money) necessary for the production of goods or the provision of services and to apply their theoretical knowledge in practical problems. Due to their holistic and analytical thinking, graduates are also able to penetrate and optimize networked processes.

Social competence

Social competence comprises the individual ability and willingness to work together with others in a goal-oriented manner, to understand the interests of others, to communicate and to help shape the working and living environment.

- 1. Graduates can integrate themselves into professionally homogeneous teams, organize themselves in these teams, take on specific subtasks and reflect on their own contribution.
- 2. Graduates are able to integrate themselves into heterogeneous teams, to organize themselves in these teams, to take on specific subtasks and to reflect on their own contribution.
- 3. Graduates are able to communicate about the contents of logistics and mobility as well as the results of their own work in an appropriate manner with both experts and laypersons.
- 4. Graduates are able to classify the social and ecological effects of logistics and transport systems on society and the environment.

Self-reliance

Personal competencies include not only the competence to act independently, but also the system and solution competencies to represent general problems as specific sub-problems as well as the selection and mastery of suitable methods and procedures for problem solving.

- 1. Graduates are able to realistically assess their competencies and work on deficits independently.
- Graduates have the ability to formulate their findings precisely in writing and orally.
 Graduates are able to independently work on sub-projects in more complex logistics and transport planning projects on
- 3. Graduates are able to independently work on sub-projects in more complex logistics and transport planning projects on the basis of the knowledge and skills they have acquired during their studies.
- 4. Graduates can reliably apply methods of scientific work and are thus also qualified to work in research or to deepen their competencies in a more

advanced course of study.

By continually switching places of learnings throughout the dual study programme, it is possible for theory and practice to be interlinked. Students reflect theoretically on their individual professional practical experience, and apply the results of their reflection to new forms of practice. They also test theoretical elements of the course in a practical setting, and use their findings as a stimulus for theoretical debate.

Program structure

The curriculum of the Bachelor's degree program "Engineering and Management - Major in Logistics and Mobility" is structured as follows:

- Core qualification, 24 compulsory modules, 3 compulsory elective modules, 162 LP, 1st-5th semester.
- Consolidation, 3 compulsory modules, 3 compulsory elective modules, 36 LP, 4th semester onwards
- Bachelor thesis, 12 LP, 6th semester

This results in a total of 210 LP.

In the core qualification, students are taught the fundamentals of mathematics, engineering, business administration, logistics and mobility, primarily in the first four semesters. In addition, there is a compulsory elective module in applied business administration, a freely selectable technical and a freely selectable non-technical supplementary module. A student research project in the fifth semester prepares students for their final thesis.

Starting in the 4th semester, students choose one of the three specializations:

- Transport planning and systems
- Production management and processes
- Information Technology

A specialization consists of three compulsory modules and three elective modules.

The fifth semester is kept as free as possible due to the high number of elective modules. This makes it possible to complete the fifth semester abroad.

The sixth semester is devoted to writing the bachelor's thesis.

The structural model of the dual study programme follows a module-differentiating approach. Given the practice-oriented element, the curriculum of the dual study programme is different compared to a standard Bachelor's course. Five practical modules are completed at the dual students' partner company as part of corresponding practical terms during lecture-free periods

Core Qualification

| Students gain basic knowledge | e as well as deepend ski | lls in mathematics and | business administration. | | |

| - | The course gives an introductory overview of the basics of supply chain management and logistics and their interaction wit |
| | freight traffic and thus the significance of traffic planning for business activities. In addition, examples of ecologically an |
| | economically sustainable best practice are discussed. The following subject areas are covered: |
| | Historical development of logistics |
| | Systemic thinking in logistics |
| | Concepts, trends and strategies in the field of |
| | Procurement logistics |
| | Production logistics |
| | Distribution logistics |
| | Reverse logistics |
| | Storage logistics |
| | • Transport logistics |
| | Handling logistics |
| | Basics of the connection between logistical decisions and traffic |
| | Introduction to traffic policy |
| | Scope for design of (sustainable) freight traffic and logistics |
| | The course contents will be consolidated by means of online surveys, Wiki entries by students and special practice sessions and |
| | illustrated by means of excursions. |

| Course L0 | 382: Management Tutorial |
|-----------|--|
| Тур | Recitation Section (small) |
| Hrs/wk | 2 |
| СР | 3 |
| Workload | Independent Study Time 62, Study Time in Lecture 28 |
| in Hours | |
| Lecturer | Prof. Christoph Ihl, Katharina Roedelius |
| Language | DE |
| Cycle | WiSe/SoSe |
| Content | In the management tutorial, the contents of the lecture will be deepened by practical examples and the application of the discussed tools. |
| | If there is adequate demand, a problem-oriented tutorial will be offered in parallel, which students can choose alternatively. Here, students work in groups on se |
| | selected projects that focus on the elaboration of an innovative business idea from the point of view of an established company or a startup. Again, the busine |
| | knowledge from the lecture should come to practical use. The group projects are guided by a mentor. |
| | |
| | |

| Content | In the era of time-competition production and logistics need to be considered as a combined strategic competitive advantage. | | |
| | "Introduction in to production logistics" gives an overview over the different disciplinces of production logistics: | | |
| | - Development from cost-, quality to time-competitiion, | | |
| | - fundamentals of production and logistics, | | |
| | - phase-oriented and functional subsystems of production logistics, | | |
| | - planning and steering, | | |
| | - analysis and optimization (focus: Lean Management), | | |
| | - production logistics controlling and supply-chain management in production network | | |
| | | | |
| | Theory is complented by case studies and guest presentations. | | |

| Knowledge | |
| | After taking part successfully, students have reached the following learning results |
| Professional Competence | |
| Knowledge | |
| | Students can name further concepts in analysis and linear algebra. They are able to explain them using appropri |
| | examples. |
| | Students can discuss logical connections between these concepts. They are capable of illustrating these connections v |
| | the help of examples. |
| | They know proof strategies and can reproduce them. |
| | |
| | |
| Skills | Students can model problems in analysis and linear algebra with the help of the concepts studied in this course. Moreover |
| | they are capable of solving them by applying established methods. |
| | • Students are able to discover and verify further logical connections between the concepts studied in the course. |
| | • For a given problem, the students can develop and execute a suitable approach, and are able to critically evaluate |
| | results. |
| | |
| | |
| Personal Competence | |
| Social Competence | |
| | Students are able to work together in teams. They are capable to use mathematics as a common language. |
| | • In doing so, they can communicate new concepts according to the needs of their cooperating partners. Moreover, they |
| | design examples to check and deepen the understanding of their peers. |
| | |
| | |
| Autonomy | Students are capable of checking their understanding of complex concepts on their own. They can specify open questi |
| | precisely and know where to get help in solving them. |
| | • Students have developed sufficient persistence to be able to work for longer periods in a goal-oriented manner on h |
| | problems. |

| | The lecture Engineering Mechanics II introduces the fundamental concepts of stress and strain and explains how these can be used to characterize and compute elastic deformations of mechanical bodies under loading. The focus of the lecture lies on: basis of continuum mechanics: stress, strain, constitutive laws truss torsion bar beam theory: bending, moment of inertia of area, transverse shear energy methods: Maxwell-Betti reciprocal work theorem, Castigliano's second theorem, theorem of Menabrea strength of materials: maximum principle stress criterion, yield criteria according to Tresca and von Mises stability of mechanical structures: Euler buckling strut | | |

| Admission Requirements | None | | | |
| Recommended Previous | Successful completion of the modules "Introduction into logistics and mobility", "Technical mechanics 1", "Mathematics 1" | | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reached t | he following learning results | | |
| Professional Competence | | | | |
| Knowledge | The students will acquire the following skills: | | | |
| | 1. The students know technical solutions for solving | logistical problems in the areas of wa | rehousing, conv | eying, sorting, ord |
| | picking and identifying. | | | |
| | 2. The students know approaches to introducing a sele | cted technical solution. | | |
| | 3. The students know practical examples of the preser | ted technical solutions. | | |
| Skills | The students will acquire the following skills: | | | |
| 01110 | 1. The students can select different technical solution: | s for logistic problems of warehousing. | convevina, sorti | ng, order picking ar |
| | identifying. | | | 5, |
| | 2. The students are able to evaluate critically the p | resented technical solutions with respe | ect to their appl | icability for differe |
| | logistical problems and compare different alternatives | | | |
| | 3. The students are able to assess the impact of select | ed solutions. | | |
| Personal Competence | | | | |
| Social Competence | The students will acquire the following social skills: | | | |
| | 1. The students will be able to sketch technical solution | ons for solving logistical problems of wa | arehousing, conv | veying, sorting, orde |
| | picking and identifying and reflect on their own contrib | oution. | | |
| | 2. The technical solutions from the group are jointly do | cumented and presented. | | |
| | 3. The students are able to present their technical solu | tions to an audience and they can deriv | e new ideas and | d improvements from |
| | the feedback. | | | |
| Autonomy | The students will acquire the following competencies: | | | |
| Autonomy | 1. The students are able to sketch autonomously, but | under supervision, technical solutions t | o logistical prob | lems of warehousing |
| | conveying, sorting, order picking and identifying. | | | |
| | | | | |
| | 2. The students are able to evaluate their technical sol | utions and discuss the pros and cons. | | |

| Content | The lecture gives an introduction in solutions and approaches of technical logistics. Five main topics will be addressed: | |
| | (1) warehousing | |
| | (2) conveying | |
| | (3) sorting | |
| | (4) order picking | |
| | (5) identifying | |
| | For each topic, various technical solutions are presented and discussed under consideration of advantages and disadvantages. | |
| | This content is supplemented by practical examples that can be complemented by inviting guest lecturers. | |
| | In the exercises selected technical solutions will be presented and discussed for certain problems and practiced by the students. | |

| | The course covers the basics of information technology in relation to logistics systems. The course is divided into five subject areas: (1) Planning of IT systems in logistics, (2) data acquisition systems, (3) communication systems, (4) IT-supported processing, (5) basic technological developments in information technology. The course consists of a basic lecture with connected exercise units. |

| Content | The course involves two main parts: During the first part of the course, participants are provided with insights into the market for ERP-Software and are provided with knowledge on how ERP-implementation projects proceed and how these projects should ideally be managed from a theoretical and practical perspective. In addition, participants are provided with an understanding of business functions and processes by means of visiting the TUHH model factory. In the model factory, participants and are solving special business cases on the basis of group- specific tasks. Finally, participants are introduced into the basic functioning of ERP-Software referring to the most common system (SAP). Participants gain a basic understanding of implementing organizational data, master data and processes into the system. During the second phase of this course, the students work independently in groups on deepening challenges, which conceptually build up on the executed case studies from phase one. Using the knowledge from phase one, the students are able to transfer the theoretical knowledge on the practical execution of the challes in SAP. The results of the group work will be presented in phase two. |
| Literature | Participants will be provided with a course handout in the form of pptslides which can be downloaded in advance. Furthe literature references regarding the theoretical concepts are not provided (as this is part of the challenge in writing the thesis) literature references with regard to the ERP-System used are as follows: Agrawal, A. (2009): Customizing Materials Management Processes in SAP ERP Operations, Galileo Press: Boston. Arif, N./Tauseef, S. (2010): Integrating SAP ERP Financials, Galileo Press: Boston. Chudy, M./Castedo, L. (2015): Sales and Distribution in SAP ERP - Practical Guide, Galileo Press: Boston. Dickersback, J. T./Keller, G. | | The seminar "Gamification of Strategic Thinking" is offered as part of the elective course of studies "Logistics and Mobility" and currently offers space for 25 students. In cooperation with the German Armed Forces Command and Staff College, the seminar aims to teach strategic methods within the framework of a wargaming approach. For this purpose, the course consists of two blocks, which take place parallel to each other throughout the semester. In the theoretical block, students are taught the basics of various methods for strategy development and management (including SWOT analysis, SCRUM or Kanban). In the second block, the students apply the methods they have learned on the basis of the board game "Sycthe". For this, the students are divided into five groups with five members each. Each of these groups plays a "party" of the board game and is supposed to develop a strategy with the help of the learned methods that helps the respective team to win. Afterwards, the experiences will be reflected upon by means of a written elaboration and a proposal for an own business wargame will be developed. |

| Content | This course centers around utilizing a team-based approach to plan, develop, and design a new artifact (product, service, software or a combination), culminating in a presentation of a prototype in the final session. The primary objective of this exercise is to gain an understanding of the principles and methods involved in innovation and product development, enhance teamwork skills, and recognize the multidisciplinary aspects inherent in product development. |

| | The business simulation game Markstrat B2B - Markstrat is a business simulation which puts you into the role of managing the marketing division of the electro-mechanical business unit of a large corporation. Competing with several other companies, you try to successfully market two products to business customers. To this end, you and other students jointly develop and implement a long-term marketing strategy for your business unit. During the 10 rounds of the simulation game, the students and the randomly assigned student team make decisions in the areas of product development, advertising, sales, price, production, and human resources on a weekly basis. To make well-informed decisions, the student teams can draw on a large number of information sources such as customer surveys, experiments, market studies, and benchmarks which you need to analyze during each round of the simulation. The simulation is accompanied by a comprehensive introduction, a concomitant coaching, as well as a mid-term and final presentation. In addition, the student teams will prepare a written report. |

| | The seminar provides an introduction to the development and programming of event and object-oriented simulation models based on the Plant Simulation software. The simulation models are focused on issues and problems in the field of intralogistics. The seminar will be conducted as a combination of theoretical content and autonomously solving simulation tasks on the computer. The students learn the ideal development workflow, programming and evaluation of a simulation model. Furthermore, the student will become familiar with the standard objects of a simulation model in Plant Simulation and their properties and functions. These standard objects will be used, if necessary with the assistance of the instructor, to build simulation models and analyze and evaluate the results. Furthermore, an introduction to the individual programming of simulation models is given on the basis of Sim Talk language. |

| Content | 1 Concept and Functions Define the role of logistics services providers in the overall concept and functions of logistics services providers. Workshop on the |
| | role of logistics services providers in the economy, based on up-to-date topics in the field and in the news. 2 Outsourcing and Cooperation |
| | Make or buy, forms and management of inter-organizational relations |
| | 3 Institutions |
| | Special business management features of carriers, haulage contractors, CEP services |
| | 4 Trends, Strategies and Management Functions |
| | Market trends, requirements, basic business management and management functions (operations, business development, HR, IT, finance/planning and control, organization, leadership) |
| | 5 Strategic Developments and Case Studies |
| | Selected aspects (e.g. risk and innovation management, global and regional networking, greenwashing and sustainability) |
| | Examples: |
| | Case Study A) Types of company (such as haulage contractors, railway operators, road transport companies, heavy goods, textile and refrigerated goods specialists, CEPs, etc) will be introduced and discussed in the context of a presentation. |
| | Case Study B) Individual companies will be analyzed on the basis of accessible material such as company reports, websites and possibly telephone interviews and case studies will be explained and discussed with regard to the functions of the logistic services provider and the management task of the corporate managements of the selected cases. |

| ntroduction to Control Systems (L0 | 0655) | Recitation Section (small) | 2 | 2 |
| Module Responsible | Prof. Timm Faulwasser | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Representation of signals and systems in time and | frequency domain, Laplace transform | | |
| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reach | od the following learning results | | |
| Professional Competence | After taking part successfully, students have reach | the following learning results | | |
| Knowledge | | | | |
| - | Students can represent dynamic system be | havior in time and frequency domain, and | can in particular | explain properties |
| | first and second order systems | | | |
| | They can explain the dynamics of simple co | ntrol loops and interpret dynamic propertie | es in terms of free | quency response a |
| | root locus | | | |
| | They can explain the Nyquist stability criteri | | | |
| | They can explain the role of the phase marg | | | |
| | They can explain the way a PID controller af | | | |
| | They can explain issues arising when control | illers designed in continuous time domain a | are implemented | digitally |
| Skills | | | | |
| | Students can transform models of linear dyr | | ain and vice vers | a |
| | They can simulate and assess the behavior | | | |
| | They can design PID controllers with the hel | | | |
| | They can analyze and synthesize simple cor | | | |
| | They can calculate discrete-time approx | imations of controllers designed in cor | itinuous-time an | d use it for dig |
| | implementation | h Control Toolhow Circulink) for corrige | | |
| | They can use standard software tools (Matla | is control rooisox, simulink) for carrying c | ut these tasks | |
| Personal Competence | | | | |
| Social Competence | Students can work in small groups to jointly solve | technical problems, and experimentally va | lidate their contro | oller designs |
| Autonomy | Students can obtain information from provided s | ources (lecture notes, software document | tation, experimen | nt guides) and use |
| | when solving given problems. | | | |
| | They can accord their knowledge in weekly on line | tacts and thoraby control their learning pr | ograce | |
| | They can assess their knowledge in weekly on-line | tests and thereby control their learning pr | ogress. | |

| Content | The lecture deals with the simulation of external logistics systems. The focus is therefore on the consideration of logistical processes between companies or on transhipment systems, such as ports or individual terminals. In the first part of the lecture, students will first acquire basic knowledge of external logistics systems and the advantages of using simulations to present them. Then an overview of existing simulation types and programs is given and examples for existing |
| | simulation models of logistic systems in science and practice are shown. Some simulation models will be demonstrated. In the second part of the lecture the students learn the basic handling of the simulation software Plant Simulation®. They receive theoretical explanations of the general functionality of the simulation tool, which are further deepened through the use of extensive, interactive examples. At the same time, five exercises, which build on each other, offer students the opportunity to implement the course content they have learnt alone and in small groups. The exercises can be completed during the supervised lecture periods as well as at other times. |
| | The acquired knowledge is to be applied in the third part in the course of group work. The students will be divided into groups, each of which will then work on a relevant problem from the field of (external) logistic systems by means of simulation. The students are given a defined period of time for their work. During this time at least one person is always available for questions and suggestions. The results of the group work are to be documented in a simulation report and handed in at the end of the processing time. Finally, the individual groups present the problems they have worked on and their results in a presentation. |

| Module Responsible | Philipp Maximilian Braun | | | |
| Admission Requirements | None | | | |
| Recommended Previous | Basic computer skills | | | |
| Knowledge | Computer Science for Engineers - Intro | oduction and Overview | | |
| Educational Objectives | After taking part successfully, student | s have reached the following learning results | | |
| Professional Competence | | | | |
| Knowledge | The students will acquire the following | ı knowledge: | | |
| | 1. The students are able to explain the | e basics of object-oriented programming with Jav | /a. | |
| | 2. The students know basic data typ programming language. | es, control structures and basic concepts of ob | oject orientation and inh | neritance in the Ja |
| | 3. The students know the necessary to | ools for programming with Java. | | |
| Skills | The students will acquire the following | skills: | | |
| | 1. The students will be able to develop | and run programs with Java independently. | | |
| | 2. The students will be able to develop | and implement own objects and classes with Ja | va. | |
| | 3. The students are able to identify an | d overcome failures autonomously (debugging). | | |
| Personal Competence | | | | |
| - | The students will acquire the following | social skills: | | |
| | 1. The students can explain self-develo | oped programs to other students. | | |
| | 2. The students can support others in | finding failures and mistakes in their software-co | ode. | |
| | 3. The students are able to present the | eir programs in front of a audience. | | |
| Autonomy | The students will acquire the following | competencies: | | |
| | 1. The students work independently w | ith an initially unknown programming language | (Java). | |
| | 2. The students are able to derive inde | ependently the necessary source code for a give | n problem. | |
| | 3. The students are able to write their | own source code in Java based on given a proble | em. | |

| Content | The seminar provides an introduction to object-oriented programming with Java. Practical knowledge will be transferred through programming exercises parallel to theoretical content. The exercises will deal mainly with logistical problems. The seminar will be conducted as an integrated seminar with a combination of theoretical content and autonomously solved programming problems on the computer. Furthermore, the student will become familiar with the standard libraries of Java and their properties and functions. These standard objects will be used, if necessary with the assistance of an instructor, to build own programs. Furthermore, an introduction to the actual software development kits (SDK) of Java will be given. |

| | Philipp Maximilian Braun | | | | |
| Admission Requirements | | | | | |
| | Successful completion of the module "Technical Logistics" | | | | |
| Knowledge | | | | | |
| 5 | After taking part successfully, students have reached the following learning results | | | | |
| Professional Competence | | | | | |
| Knowledge | The students will acquire the following knowledge: | | | | |
| | 1. The students are able to understand and explain the concept "Logistical System". | | | | |
| | 2. The students are able to design a legistic system concentually | | | | |
| | 2. The students are able to design a logistic system conceptually. | | | | |
| | 3. The students can develop and implement the control of a logistic system with python. | | | | |
| Skills | The students will acquire the following skills: | | | | |
| | 1. The students are able to identify logistical systems, analyze and identify potential for change and improvement. | | | | |
| | 2. The students know different technical solutions to address problems in logistical systems. | | | | |
| | 3. The students are capable of deploying technical solutions and ideas from the concept Industry 4.0 to deal with logist problems. | | | | |
| Personal Competence | | | | | |
| | The students will acquire the following social skills: | | | | |
| | 1. The students are able to develop technical solutions for logistical systems and reflect their contribution within the team. | | | | |
| | 2. The technical solutions from the group can be jointly documented and presented. | | | | |
| | 3. Students are able to present their technological solutions to an audience and derived from the critique new ideas improvements. | | | | |
| Autonomy | The students will acquire the following independent competencies: 1. The students can independently develop technical solutions for logistical problems under supervision. | | | | |
| | 2. The students are able to evaluate their technical solutions and discuss the pros and cons. | | | | |
| | 3. The students are able to assess the impact of the concept Industry 4.0 on their own career development. | | | | |

| Content | The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here, the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown. |
| | In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used to improve logistical systems. |

| Admission Requirements | None | | | |
| Recommended Previous | no course assessments required | | | |
| Knowledge | internship recommended | | | |
| | | | | |
| Educational Objectives | After taking part successfully, students have reached the | e following learning results | | |
| Professional Competence | | | | |
| Knowledge | Students are able to | | | |
| | name basic criteria for the selection of manufacture | ring processes. | | |
| | name the main groups of Manufacturing Technology | | | |
| | name the application areas of different manufactor | | | |
| | name boundaries, advantages and disadvantages | of the different manufacturing proce | ss. | |
| | describe elements, geometric properties and kine | matic variables and requirements for | tools, workpiece | and process. |
| | explain the essential models of manufacturing tee | hnology. | | |
| | | | | |
| | | | | |
| Skills | Students are able to | | | |
| | select manufacturing processes in accordance wit | h the requirements | | |
| | design manufacturing processes for simple tasks | | e component to b | e produced. |
| | assess components in terms of their production-o | | | e producedi |
| | | | | |
| | | | | |
| Personal Competence | | | | |
| Social Competence | Students are able to | | | |
| | | | | |
| | develop solutions in a production environment with | h qualified personnel at technical lev | el and represent | decisions. |
| | | | | |
| | | | | |
| Autonomy | Students are able to | | | |
| | interpret independently the manufacturing process | SS. | | |
| | assess own strengths and weaknesses in general. | | | |
| | assess their learning progress and define gaps to | be improved. | | |
| | assess possible consequences of their actions. | | | |
| | | | | |

| - | The content of experiment 1: |
| | Accuracy testing of a delta robot: In the course of the experiment, the accuracy of a delta robot is tested through 3 tasks. The fit task focuses on the online/offline programming of the robot. The second task deals with sensor calibration. In the third task, t radius of a sphere is determined using three different measurement methods (manual measurement, manual measurement with sensor, automatic data acquisition and data processing). |
| | The content of experiment 3: |
| | The aim of the task is to enable the parallel kinematics to find objects, grasp them and place them on a static target position f this purpose, the end effector of the kinematics is equipped with an optical sensor (camera), whose characteristics are to defined. The measuring range of the sensor is to be identified and, based on this, a movement strategy for finding the objects is be developed and implemented. Once the objects have been found, they are to be picked up with a magnetic gripper a transported to their destination. |
| | The content of experiment 4: |
| | The aim of the task is to enable the parallel kinematics to find objects, grab them and deposit them on a moving platform. For the purpose, the end effector of the kinematics is equipped with an optical sensor (camera), the properties of which were worked of in experiment 3. Based on this, the parallel kinematics should now be able to follow the moving platform. For this purpose, position control must be developed and implemented. Once the controller has been appropriately configured, the objects can placed on the moving platform. |

| Knowledge | | | | |
| Educational Objectives | After taking part successfully, students have reached t | he following learning results | | |
| Professional Competence | | | | |
| Knowledge | | | | |
| , nonedge | Students can name the basic concepts in the are | ea of analysis and differential equations | . They are able t | to explain them using |
| | appropriate examples. | | | |
| | Students can discuss logical connections between | en these concepts. They are capable | of illustrating th | ese connections with |
| | the help of examples. | | | |
| | They know proof strategies and can reproduce t | hem. | | |
| | | | | |
| | | | | |
| Skills | | | | |
| Skiis | Students can model problems in the area of ana | alysis and differential equations with the | e help of the cor | ncepts studied in this |
| | course. Moreover, they are capable of solving th | nem by applying established methods. | | |
| | • Students are able to discover and verify further | logical connections between the concep | ots studied in the | e course. |
| | • For a given problem, the students can develop | p and execute a suitable approach, ar | nd are able to c | ritically evaluate the |
| | results. | | | , |
| | | | | |
| | | | | |
| Devenuel Commetence | | | | |
| Personal Competence | | | | |
| Social Competence | • Students are able to work together in teams. Th | ey are capable to use mathematics as a | a common langu | age. |
| | In doing so, they can communicate new conception | | | |
| | design examples to check and deepen the unde | | | |
| | | istanding of their peerst | | |
| | | | | |
| A | | | | |
| Autonomy | Students are capable of checking their understa | anding of complex concepts on their o | wn. They can sp | ecify open questions |
| | precisely and know where to get help in solving | them. | | |
| | Students have developed sufficient persistence | e to be able to work for longer periods | s in a goal-orien | ted manner on hard |
| | problems. | | 5 | |
| | prodiction | | | |
| | | | | |

| Content | Within the Production Logistics Seminar the students shall compose a first term paper. In the beginning production-close logstic topics will be distributed which the students have to elaborate on their own. This workshop aims at the better motivation of the students to structure new and creative ideas and develop them to innovative solutions. This workshop contains regular meetings as well as two presentations in the middle and at the end. | | |

| Content | In the course Transport Systems and Handling Technology the elementary basics, characteristics, possible applications and areas of expediency of transport and handling technology are taught. The students should be enabled to select, conceptualize and evaluate suitable techniques for defined transport and handling tasks. In addition to the goods to be transported and the loading units, the various means of transport, handling concepts and the necessary equipment play a special role. A basic knowledge of the relevant guidelines and standards is also built up. In addition to the transport systems road, rail, water (inland waterways and maritime shipping) and air transport, combined transport is also addressed. Contents of the lecture Basics, possible applications, usefulnes of different transport and handling techniques Overview of transported goods, loading units, means of transport, handling terminals and equipment Representation of the modes of transport: road, rail, water (inland waterway, ocean-going vessel), air, combined transport |

| Content | The exercise of the course Traffic Systems and Handling Technology is carried out as a guided group exercise. In the exercise sessions, students receive assignment sheets on the sub-topics of the course and work on these independently. The exercise sheets mainly consist of computational tasks as well as comprehension questions. The lecturers are available to the students during the exercise to discuss calculation methods and results. There is the possibility for students to earn 10-15% bonus points on their passed exam in the course of voluntary additional work, depending on the extent. For example, by working on the worksheets in small groups and handing them in. The classroom training can be supplemented by digital exercises. | | | | |

| Content | The lecture deals with the simulation of external logistics systems. The focus is therefore on the consideration of logistical processes between companies or on transhipment systems, such as ports or individual terminals. |
| | In the first part of the lecture, students will first acquire basic knowledge of external logistics systems and the advantages of using simulations to present them. Then an overview of existing simulation types and programs is given and examples for existing simulation models of logistic systems in science and practice are shown. Some simulation models will be demonstrated. |
| | In the second part of the lecture the students learn the basic handling of the simulation software Plant Simulation®. They receive theoretical explanations of the general functionality of the simulation tool, which are further deepened through the use of extensive, interactive examples. At the same time, five exercises, which build on each other, offer students the opportunity to implement the course content they have learnt alone and in small groups. The exercises can be completed during the supervised lecture periods as well as at other times. |
| | The acquired knowledge is to be applied in the third part in the course of group work. The students will be divided into groups, each of which will then work on a relevant problem from the field of (external) logistic systems by means of simulation. The students are given a defined period of time for their work. During this time at least one person is always available for questions and suggestions. The results of the group work are to be documented in a simulation report and handed in at the end of the processing time. Finally, the individual groups present the problems they have worked on and their results in a presentation. |

| Content | The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here, the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown. |
| | In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used to improve logistical systems. |

| Content | The seminar provides an introduction to object-oriented programming with Java. Practical knowledge will be transferred through programming exercises parallel to theoretical content. The exercises will deal mainly with logistical problems. The seminar will be conducted as an integrated seminar with a combination of theoretical content and autonomously solved programming problems on the computer. Furthermore, the student will become familiar with the standard libraries of Java and their properties and functions. These standard objects will be used, if necessary with the assistance of an instructor, to build own programs. Furthermore, an introduction to the actual software development kits (SDK) of Java will be given. |

| Cycle | SoSe |
| Content | 1 Concept and Functions Define the role of logistics services providers in the overall concept and functions of logistics services providers. Workshop on the role of logistics services providers in the economy, based on up-to-date topics in the field and in the news. |
| | 2 Outsourcing and Cooperation |
| | Make or buy, forms and management of inter-organizational relations |
| | 3 Institutions |
| | Special business management features of carriers, haulage contractors, CEP services |
| | 4 Trends, Strategies and Management Functions |
| | Market trends, requirements, basic business management and management functions (operations, business development, HR, IT, finance/planning and control, organization, leadership) |
| | 5 Strategic Developments and Case Studies |
| | Selected aspects (e.g. risk and innovation management, global and regional networking, greenwashing and sustainability) |
| | Examples: |
| | Case Study A) Types of company (such as haulage contractors, railway operators, road transport companies, heavy goods, textile and refrigerated goods specialists, CEPs, etc) will be introduced and discussed in the context of a presentation. |
| | Case Study B) Individual companies will be analyzed on the basis of accessible material such as company reports, websites and possibly telephone interviews and case studies will be explained and discussed with regard to the functions of the logistics services provider and the management task of the corporate managements of the selected cases. |

| Simulation of intra logistics (L1755) |) Seminar 4 6 | |
| Module Responsible | Philipp Maximilian Braun | |
| Admission Requirements | | |
| | Successful completion of the module "Technical Logistics" | |
| Knowledge | | |
| | After taking part successfully, students have reached the following learning results | |
| Professional Competence | | |
| Knowleage | The students will acquire the following knowledge: | بالملا |
| | The students are able to explain the significance, the structure and the components of an event- and object-oriented simu model in intralogistics. | liatio |
| | 2. The students are able to reflect and explain the process of creating and programming an event- and object-oriented simu model in intralogistics. | ılatio |
| | 3. The students are able to view critically the strengths and weaknesses of event- and object-oriented simulation model. | |
| Skills | The students will acquire the following skills: | |
| | 1. The students will be able to derive the necessary parameters for the development of an event- and object-oriented simu | ulati |
| | model in intralogistics from an existing logistics system. | |
| | 2. The students will be able to program and run Plant Simulation simulation models independently. | |
| | 3. The students can evaluate and interpret the results from a simulation model. | |
| Personal Competence | | |
| Social Competence | The students will acquire the following social skills: 1. The students are able to develop a complex simulation model in a team. | |
| | 2. The students know the different roles in joint development of a simulation model and can give feedback to their respective | e role |
| | 3. The students are able to process the simulation results and present them in front of a audience. | |
| Autonomy | The students will acquire the following independent competencies: | |
| | 1. The students work independently in an initially unknown software (Plant Simulation). | |
| | 2. The students are able to derive independently the necessary simulation parameters from information about a logistics syst | tem. |
| | 3. The students are able to develop and program an event- and object-oriented simulation models from given parameters. | |

| | The seminar provides an introduction to the development and programming of event and object-oriented simulation models based on the Plant Simulation software. The simulation models are focused on issues and problems in the field of intralogistics. The seminar will be conducted as a combination of theoretical content and autonomously solving simulation tasks on the computer. The students learn the ideal development workflow, programming and evaluation of a simulation model. Furthermore, the student will become familiar with the standard objects of a simulation model in Plant Simulation and their properties and functions. These standard objects will be used, if necessary with the assistance of the instructor, to build simulation models and analyze and evaluate the results. Furthermore, an introduction to the individual programming of simulation models is given on the basis of Sim Talk language. | |

| Content | This course places its focus on transport and mobility in Germany. It deals with questions such as: |
| Literatura | Which external factors - like e.g. energy costs, availability of renewable and fossil fuels, environmental and climate protection objectives - influence current developments in the transport sector? Which external effects in turn are caused by mobility choices and traffic? How should these interactions be evaluated, how and by whom can they be influenced? Which measures at the municipal level can contribute to a more sustainable transport system? During the course, these questions will be illustrated and discussed with reference to different examples and current developments. Participants will also provide input on specific topics. Potential core subjects of the course could be: Environmental Justice : which population groups are disproportionately affected by transport emissions and who causes them? Municipal cycle planning Transport and Climate Protection: can, want, act - everything could be, nothing must be? |
| Literature | Die Literaturempfehlungen sind abhängig von den jeweiligen, wechselnden Themenschwerpunkten und werden rechtzeitig vor Beginn der Veranstaltung bekannt gegeben. |

| | The course provides and overview over different transport projects in the metropolitan areas of developing countries. Considering different perspectives on urban growth, social justice, economic development, environmental and climate protection as well as the economic viability of public transport, the specific situation in the urban conglomerates of Asia, Latin America and Africa will be analysed and placed in a regional and global context. Specific public transport systems will be examined to establish, whether they are a suitable example for sustainable urban development. The following examples could be suitable case studies: Singapore (Metro), Lagos (BRT Light), Guanghzou, Bogota, Jakarta (Full BRT), Sao Paulo, Medellin (Cable Car Systems), Johannesburg (Minibus-Taxi). The course will be designed interactively with the students and will partly be in English as is the majority of the literature in this area (also: Skype online interviews with international experts in the transport sector). An English language presentation is also part of the course work. |

| | After taking part successfully, students have | ve reached the following learning results | | |
| Professional Competence | | | | |
| Knowledge | Students are able to: | | | |
| | - explain and classify the terms and their r | neaning in transport and handling technology | | |
| | - reflect current political conditions and teo | chnical developments in transport and handling | technology; | |
| | - identify actors and their tasks in the mari | time transport chain (pre-carriage, carriage, or | n-carriage); | |
| | | e applications and areas of use of transport hat should it be transported? Where is the care | | |
| Skills | Students can, on the basis of the knowledg | ge they have acquired: | | |
| | - identify and evaluate key performance in | dicators (e.g. transport times, storage costs, e | c.) in the maritime t | ransport chain; |
| | - select and dimension suitable techniques for defined transport and handling tasks and critically evaluate approaches to se | | | |
| | | handling technologies (e.g. by calculating ca point-to-point or hub-and-spoke freight transpo | | sport times and co |
| Personal Competence | | | | |
| Social Competence | Students are able to: | | | |
| | | d organise research tasks in small groups in esent and represent them in a comprehensible | | omprehensive writt |
| | - describe, differentiate and evaluate prob in container shipping or the establishment | lems (e.g. in the joint compilation of factual kr of different maritime supply chains); | nowledge on topics s | uch as slow steami |
| | - participate in technical discussions on top | oics from the transport and handling technolog | у. | |
| Autonomy | After completion of the module students ca | apable to: | | |
| | - acquire knowledge of parts of the subject | area independently and apply the acquired kr | owledge to solve ne | w problems; |
| | - conduct a systematic literature search ar | nd record this in a scientific text; | | |
| | - critically reflect on the results of their ow | n work. | | |

| Cycle | WiSe |
| Content | In the course Transport Systems and Handling Technology the elementary basics, characteristics, possible applications and areas of expediency of transport and handling technology are taught. The students should be enabled to select, conceptualize and evaluate suitable techniques for defined transport and handling tasks. In addition to the goods to be transported and the loading units, the various means of transport, handling concepts and the necessary equipment play a special role. A basic knowledge of the relevant guidelines and standards is also built up. In addition to the transport systems road, rail, water (inland waterways and maritime shipping) and air transport, combined transport is also addressed. Contents of the lecture Basics, possible applications, usefulnes of different transport and handling techniques Overview of transported goods, loading units, means of transport, handling terminals and equipment Representation of the modes of transport: road, rail, water (inland waterway, ocean-going vessel), air, combined transport |

| Content | The exercise of the course Traffic Systems and Handling Technology is carried out as a guided group exercise. In the exercise sessions, students receive assignment sheets on the sub-topics of the course and work on these independently. The exercise sheets mainly consist of computational tasks as well as comprehension questions. The lecturers are available to the students during the exercise to discuss calculation methods and results. There is the possibility for students to earn 10-15% bonus points on their passed exam in the course of voluntary additional work, depending on the extent. For example, by working on the worksheets in small groups and handing them in. The classroom training can be supplemented by digital exercises. |

| Content | The lecture deals with the simulation of external logistics systems. The focus is therefore on the consideration of logistical processes between companies or on transhipment systems, such as ports or individual terminals. In the first part of the lecture, students will first acquire basic knowledge of external logistics systems and the advantages of using simulations to present them. Then an overview of existing simulation types and programs is given and examples for existing simulation models of logistic systems in science and practice are shown. Some simulation models will be demonstrated. In the second part of the lecture the students learn the basic handling of the simulation software Plant Simulation®. They receive theoretical explanations of the general functionality of the simulation tool, which are further deepened through the use of extensive, interactive examples. At the same time, five exercises, which build on each other, offer students the opportunity to implement the course content they have learnt alone and in small groups. The exercises can be completed during the supervised lecture periods as well as at other times. The acquired knowledge is to be applied in the third part in the course of group work. The students will be divided into groups, each of which will then work on a relevant problem from the field of (external) logistic systems by means of simulation. The |
| Literature | students are given a defined period of time for their work. During this time at least one person is always available for questions and suggestions. The results of the group work are to be documented in a simulation report and handed in at the end of the processing time. Finally, the individual groups present the problems they have worked on and their results in a presentation. Bangsow, Steffen (2020): Tecnomatix Plant Simulation. | Content | The lecture gives an introduction to the concept of logistical systems with a special emphasis on the subject of Industry 4.0. Here, the system concept in logistics from a technical point of view is introduced. A logistical system is understood as a combination of transport, storage and change processes between source and sink of goods. This lecture will look at the technical aspect of these processes. Industry is a topic of this lecture. Industry 4.0 is understood as the far-reaching digitization and networking of logistical systems and the connection of logistical objects, processes and systems. The logistics industry expects Industry 4.0 to be a profound change and the realization of large improvement potentials. The lecture provides an in-depth introduction to application cases and business models of Industry 4.0 in logistics from a technical standpoint. A possible framework for Industry 4.0 is presented and several application examples are shown. |
| | In the exercises, students learn will learn the exemplary use of different technical solutions and know how, which can be used to improve logistical systems. |

| Admission Requirements | None | | | | | |
| Recommended Previous | Mathematics I, II and II | 11 | | | | |
| Knowledge | Mechanics I und II | | | | | |
| Educational Objectives | After taking part succe | essfully, students have re | eached the followin | ig learning results | | |
| Professional Competence | | | | | | |
| | They are able to deriv and quantify the rele rainfall-run-off-modelli hydrograph. | The students are able to define the basic terms of hydromechanics, hydrology groundwater hydrology and water management They are able to derive the basic formulations of i) hydrostatics, ii) kinematics of flows and iii) conservation laws and to describ and quantify the relevant processes of the hydrological water cycle. Besides, the students can describe the main aspects of rainfall-run-off-modelling and of established reservoir / storage models as well as the concepts of the determination of a unit hydrograph. | | | | |
| Skills | The students are able to apply the fundamental formulations of hydromechanics to basic practical problems. Furthermore, they ar able to run, explain and document basic hydraulic experiments. Besides, they are able to apply basic hydrological approaches and methods to simple hydrological problems. The students hav the capability to exemplarily apply simple reservoir/storage models and a unit-hydrograph to given problems. In addition, the basic concepts of field-measurements of hydrological and hydrodynamic values can be described and the student are able to perform, analyze and assess respective measurements. | | | | | |
| Personal Competence | | | | | | |
| Social Competence | | se of peer learning appr | | structured manner. They can e re, they are able to prepare ar | | |
| Autonomy | Students are capable of organising their individual work flow to contribute to the conduct of experiments and to present discipline specific knowledge. They can provide each other with feedback and suggestions on their results. They are capable of reflecting their study techniques and learning strategy on an individual basis. | | | | | |

| Content | In the exercise-lecture the topics from the main lecture are discussed intensively and transferred into application. For that, the students receive example tasks for download. The students solve these problems based on the lecture material either independently or in small groups. The solution is discussed with the students under scientific supervision and parts of the solution are presented on the chalk board. At the end of each exercise-lecture, the correct solution is presented on the chalk board. Parallet to the exercise-lecture tutorials are held where the student solve exam questions under a set time-frame in small groups and discuss the solutions afterwards. |

| Cycle | SoSe |
| Content | 1 Concept and Functions Define the role of logistics services providers in the overall concept and functions of logistics services providers. Workshop on the role of logistics services providers in the economy, based on up-to-date topics in the field and in the news. |
| | 2 Outsourcing and Cooperation |
| | Make or buy, forms and management of inter-organizational relations |
| | 3 Institutions |
| | Special business management features of carriers, haulage contractors, CEP services |
| | 4 Trends, Strategies and Management Functions |
| | Market trends, requirements, basic business management and management functions (operations, business development, HR, IT, finance/planning and control, organization, leadership) |
| | 5 Strategic Developments and Case Studies |
| | Selected aspects (e.g. risk and innovation management, global and regional networking, greenwashing and sustainability) |
| | Examples: |
| | Case Study A) Types of company (such as haulage contractors, railway operators, road transport companies, heavy goods, textile and refrigerated goods specialists, CEPs, etc) will be introduced and discussed in the context of a presentation. |
| | Case Study B) Individual companies will be analyzed on the basis of accessible material such as company reports, websites and possibly telephone interviews and case studies will be explained and discussed with regard to the functions of the logistics services provider and the management task of the corporate managements of the selected cases. |

| Content | Lecture: |
| | The module provides a basic knowledge of the field of railroad engineering. An overview of railroad operations, control and safety technology, railroad superstructure, structural engineering, project management as well as maintenance and design of infrastructure facilities is given. The aim of this module is to give students as much insight as possible into railroad infrastructure. The module is examined by means of a written exam at the end of the semester. Lecture Hall Exercise: In order to give the students practical examples, full-day practical excursions are carried out. New handling techniques and currently available hardware will be presented by visiting the marshalling yard "die Zugbildungsanlage Maschen (ZBA)". Furthermore, the training center for track construction and civil engineering as well as the operations center in Hanover will be visited, where facilities and tasks will be presented. Questionnaires will also be provided for practice purposes. In addition, study papers can be handed out and supervised as required. |

| Course L0293: Electrical Machines and Actuators | | |
|---|--|--|
| Тур | Lecture | |
| Hrs/wk | 3 | |
| CP | 4 | |
| Workload in Hours | Independent Study Time 78, Study Time in Lecture 42 | |
| Lecturer | Prof. Thorsten Kern, Dennis Kähler | |
| Language | DE | |
| Cycle | SoSe | |
| Content | Electric field: Coulomb's law, flux (field) line, work, potential, capacitor, energy, force, capacitive actuators | |
| | Magnetic field: force, flux line, Ampere's law, field at bounderies, flux, magnetic circuit, hysteresis, induction, self-induction, mutual inductance, transformer, electromagnetic actuators | |
| | Synchronous machines, construction and layout, equivalent single line diagrams, no-load and short-cuircuit characteristics, vector diagrams, motor and generator operation, stepper motors | |
| | DC-Machines: Construction and layout, torque generation mechanismen, torque vs speed characteristics, commutation, | |
| | Asynchronous Machines. Magnetic field, construction and layout, equivalent single line diagram, complex stator current diagram (Heylands´diagram), torque vs. speed characteristics, rotor layout (squirrel-cage vs. sliprings), | |
| | Drives with variable speed, inverter fed operation, special drives | |
| Literature | Hermann Linse, Roland Fischer: "Elektrotechnik für Maschinenbauer", Vieweg-Verlag; Signatur der Bibliothek der TUHH: ETB 313 | |
| | Ralf Kories, Heinz Schmitt-Walter: "Taschenbuch der Elektrotechnik"; Verlag Harri Deutsch; Signatur der Bibliothek der TUHH: ETB 122 | |
| | "Grundlagen der Elektrotechnik" - anderer Autoren | |
| | Fachbücher "Elektrische Maschinen" | |

| Course L0294: Electrical Machines and Actuators | |
|---|---|
| Тур | Recitation Section (large) |
| Hrs/wk | 2 |
| CP | 2 |
| Workload in Hours | Independent Study Time 32, Study Time in Lecture 28 |
| Lecturer | Prof. Thorsten Kern, Dennis Kähler |
| Language | DE |
| Cycle | SoSe |
| Content | See interlocking course |
| Literature | See interlocking course |

| Thesis Module M1800: Bachelor thesis (dual study program) | | |
|---|--|--|
| | | |
| Title | Typ Hrs/wk CP | |
| Module Responsible | Professoren der TUHH | |
| Admission Requirements | None | |
| Recommended Previous | | |
| Knowledge | A fina ha bina manifesta ana anfalla a bandan ka bana ana aka di kha fa Ukunian bananian manuka | |
| | After taking part successfully, students have reached the following learning results | |
| Professional Competence | Dual students | |
| | choose central theoretical principles from their field of study (facts, theories, methods) in relation to problems and applications, present them and discuss them critically. further develop their subject-related and practical knowledge as appropriate and link both areas of knowledge together. present the current research available on a chosen topic or on a chosen operational issue linked to their subject. | |
| Skills | Dual students evaluate both the basic knowledge linked to their field of study acquired at the university and professional knowledge gained through the company, then purposefully use it to solve technical and application-related problems. analyse questions and problems using the methods learned throughout their studies (including practical phases), reach factually justifiable decisions and develop application-specific solutions. critically analyse the results of their own research work from a subject-specific and professional perspective. | |
| Personal Competence Social Competence | Dual students present a professional problem in the form of an academic question for a specialist audience in a structured, comprehensible and factually correct manner, both orally and in writing. respond to questions as part of a specialist discussion and answer them appropriately. In doing so, they argue their own evaluations and points of view convincingly. | |
| Autonomy | Dual students structure a comprehensive, chronological workflow and work independently on a question to a high academic level withir a given period of time. identify, develop and link necessary knowledge and material to handle an academic and application-related problem. apply the essential techniques of academic work when conducting their own research on an operational issue. | |
| Workload in Hours | Independent Study Time 360, Study Time in Lecture 0 | |
| Credit points | 12 | |
| Course achievement | None | |
| Examination | Thesis | |
| | According to General Regulations | |
| scale Assignment for the Following Curricula | General Engineering Science (German program, 7 semester): Thesis: Compulsory Civil- and Environmental Engineering: Thesis: Compulsory Chemical and Bioprocess Engineering: Thesis: Compulsory Computer Science: Thesis: Compulsory | |
| | Data Science: Thesis: Compulsory Electrical Engineering: Thesis: Compulsory Engineering Science: Thesis: Compulsory Green Technologies: Energy, Water, Climate: Thesis: Compulsory Computer Science in Engineering: Thesis: Compulsory Mechanical Engineering: Thesis: Compulsory Mechatronics: Thesis: Compulsory Naval Architecture: Thesis: Compulsory Technomathematics: Thesis: Compulsory Engineering and Management - Major in Logistics and Mobility: Thesis: Compulsory | |
